OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

GOLD SULPHURETS SAVED.

"GATES' PATENT" for saving Gold Sulphurets below quartz mills. Built by J. A. GILBERT, Jackson, California.

A New and Valuable American book for Prospectors and Miners.
JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining," illustrated by 44 engravings. 12mo, 175 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analysis of Ores, Wet Method, Dry Assay of Ores. V. Special Mineralogy, Gold. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron, X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo. 367 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 88 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING FEB. 16, 1892.

- 468,786.—VENTILATOR—A. B. Brown, Los Angeles, Cal.
 469,120.—ORE CRUSHER—J. Brumbaugh, Gold Hill, Or.
 468,985.—SEWER GATE—John Downs, S. F., Cal.
 468,986.—CULTIVATOR—G. W. Forbes, Guberville, Cal.
 468,982.—STEAM COOKER—J. H. Howard, Pasadena, Cal.
 468,989.—SWIMMING APPARATUS—E. R. Mallett, S. F.
 468,890.—CAP AND FUSE COUPLER—K. McFarland, Clackamas, Or.
 468,824.—MOTOR FOR STREET CARS—A. J. Painter, Pasadena, Cal.
 468,093.—ELECTRIC ARC LAMP—H. Sawyer, S. F.
 468,937.—VISCID FATTY COMPOUND—A. Sommer, Berkeley, Cal.
 468,838.—BUILDING BRICK—L. A. Steiger, San Jose, Cal.
 468,839.—PAVING BLOCK—L. A. Steiger, San Jose, Cal.
 468,840.—INTERLOCKING BRICK—L. A. Steiger, San Jose, Cal.
 468,841.—ELEVATED RAILWAY—G. A. Stephenson, Los Angeles, Cal.
 468,842.—ELEVATED RAILWAY MOTOR—G. A. Stephenson, Los Angeles, Cal.
 469,187.—STEAM STAMP—C. W. Tremain, Portland, Or.
 468,979.—FLUISING APPARATUS—Frank Walker, Los Angeles, Cal.

The following brief list by telegraph, for Feb. 23, will appear more complete on receipt of mail advices.

Elmer Bowen, Los Angeles, automatic car coupling; William F. Buswell, San Francisco, pulley; Frederick W. Cook, San Francisco, gang edger; James E. E. Depe, Oakland, ledger, sales and billing book; Frank H. Disbrow, Glendora, stoning knife; Peter B. Donahoe, Fresno, street sweeping machine; John H. Driller, Los Angeles, automatic funnel cut-off; Thomas Fuller, Angels Camp, safety device for mining cars or elevators; James H. Hawthornthwaite, San Francisco, amalgamator; William Holder, Mokelumne, atmospheric bed covering; Robert W. Jessup, Alameda, seed cleaner; Alexander J. McAdam, San Francisco, hydraulic elevator; C. Vogel, San Anselmo, conduit for cable and electric tramways; John W. Pack, San Francisco, hydraulic motor; John A. Peron, Ferris, inhaler and respirator; William Smith, Berkeley, electric railway.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC ARC LAMP.—Houghton Sawyer, S. F. No. 469,093. Dated Feb. 16, 1892. This invention consists essentially in a lamp containing a magazine for holding the upper and lower carbons, which carbons, by suitable means, may be thrown successively and respectively into a pair of carbon holders as required. It also consists in the novel construction and arrangement of the magazine, the carbon holders which receive the carbons from the magazine and the devices for releasing the burned carbons and introducing and holding a fresh pair of carbons. The object of the invention is to provide what may be termed a magazine arc lamp automatic in its action and capable of carrying a number of carbons and supplying them successively to a pair of holders whereby a light may be had for an indefinite period of time without having to replenish the carbons by personal attention.

CULTIVATOR.—George W. Forbes, Guberville, Santa Clara Co. No. 468,986. Dated Feb. 16, 1892. The object of this invention is to raise both ends of a wheeled cultivator equally and level without strain on the neck yokes of the horses to secure the tooth shanks in a simple and effective manner, consistent with rigidity of the frame beams, to secure the several connecting lugs and arms in a way at once simple and effective, and generally to provide a durable and readily operative and adjustable cultivator.

SWIMMING APPARATUS.—Edmond R. Mallett, S. F., assignor of one-half to John Baumann. No. 468,989. Dated Feb. 16, 1892. This novel apparatus for swimming purposes consists of a flexible supporting structure adapted to be fitted to the body of the individual and rotary propellers or screws mounted on suitable framework and attached to this support with a mechanism by which the propellers may be rotated, and cords connecting this mechanism with the feet of the swimmer, so that by the movement of the feet the propellers are kept in operation.

SEWER GATE.—John Downs, S. F. No. 468,985. Dated Feb. 16, 1892. This invention relates to the class of doors or gates for sewers for the purpose of preventing the back-flow of tide or other water which may accumulate in the sewer, and also to prevent sewer gas passing from the main sewers into houses through the side connections. The object of the invention is to provide a simple and effective gate of this class especially adapted for side sewers, and which will prevent the back-water from getting into said side sewers, and will also answer for a trap to prevent the sewer gas from passing into and through said sewers into buildings or street openings which convey surface water into the sewers.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, February 25, 1892.

General trade continues slow, but everything points to more activity soon after assessment day. Iron workers are quite confident of an active season. They are generally well supplied with orders for immediate work, while some report orders ahead. The very favorable outlook for grain crops, gives assurance that a large tonnage will head this way for wheat cargoes which will insure liberal supplies, and at easy prices, of raw material, iron, coal, etc. The money market is fairly easy at current rates of interest. New York continues to report a plethora of funds. Foreign money markets are reported feverish with more or less stringency owing to a want of confidence. Securities are closely scrutinized.

MEXICAN DOLLARS.—The market is fairly firm at around 7 1/2 cts.

QUICKSILVER.—Receipts the past week aggregate 456 flasks. The market is easy at quotations. The overland shipments in last month via S. P. R. R. aggregated 59 tons. During the past week the exports via sea were 200 flasks to Mexico, 120 to Central America and 1200 to New York via Canadian Pacific.

SILVER.—The market shaded off the forepart of the week but toward the close it is strengthening. New York quotations came through to-day at 91 cts. The general statistical situation of the metal favors a higher range of prices. Continued monthly purchases of 4,500,000 ounces by the United States and a steadily decreasing output of the mines, are helping the surplus in the country which, even with no other influence, will soon act favorably on the markets in the United States and Europe. India's extraordinarily large purchases in 1889 and 1890 are about exhausted, which will soon cause that country to buy more heavily. There is everything at this writing to warrant the assertion that Portugal and also the Argentine Republic in regaining the surplus in the country which, even if adopted silver to a very great extent, Austria Hungary will not dispose of all the silver now held, but keep enough to mint fractional coin for general use. It seems Congress, will act soon on the free coinage bill. It is asserted by those who should know, that both branches will pass a free coinage bill.

ANTIMONY.—The market continues slow at easy prices.

BORAX.—Receipts the past week aggregate 365 casks. Overland shipments last month via S. P. R. R. were as follows, in tons: From San Francisco, 17; Oakland, 37; and Sacramento, 143. The market is steady at combination prices.

LIME.—Receipts the past week aggregate 2884 bbls.

IRON.—Imports the past week aggregate 1500 pigs from Sydney, and 33,605 boxes of iron from Swansea. The local market is unchanged. The same conditions reported last week still continue. The East and Europe report a stronger tone, with holders inclined to bullishness.

COPPER.—Exports by sea the past week aggregate 67,855 lbs. copper matte to New York. Overland shipments in last month by the S. P. R. R. aggregated as follows: From Los Angeles and south (Arizona), 1157 tons copper and 121 tons copper cement. There were also 13 tons of cement sent from Stockton. The Iron Age reports the New York market barely steady, owing to large available supplies, and that, too, in the face of heavy sales of Lake.

COAL.—Imports the past week aggregate as follows: Coos Bay, 80 tons; Tacoma, 4300; Newcastle, N. S. W., 321; Liverpool, 10,960; Cardiff, 2240; Departure Bay, 2445; Sydney, 2703; Greenock, 2050; New York, 246; Nanaimo, 2607; Newcastle, England, 1900. Total, 35,247 tons. Continued heavy receipts and a reported falling off in the consumption demand are against spot and nearly due cargoes, while continued favorable crop prospects are against cargoes for shipment.

COKE.—Imports the past week aggregate as follows: Newcastle (England), 519 tons; Antwerp, 500. Total, 1019 tons. The market is barely steady for parcels in all positions.

Eastern Metal Markets.

New York, Feb. 25.—The following are the closing prices the past week:

Silver in London.	New York.	Copper.	Lead.	Tin.
Thursday, 41 1/16	61	10 75	4 15	19 75
Friday, 41 1/16	60 1/2	10 75	4 15	19 75
Saturday, 41 5/16	61	10 75	4 15	19 75
Monday, 41 1/16	61	10 75	4 15	19 75
Tuesday, 41 1/16	61	10 75	4 15	19 75
Wednesday, 41 9/16	60 1/2	10 75	4 15	19 75

The metal market shows no strength for Lead, but for Copper, Tin and Iron buyers are favored. Quicksilver is weak and slow. Borax is steady. Antimony is barely steady at 11c @ 11 1/2 cts quoted for Hallett's, 12 1/2 cts for LX, and 13c @ 15 1/2 cts for Cookson's.

Mining Share Market.

SAN FRANCISCO, Feb. 25, 1892.

To outside shareholders mining shares the past week proved to be a Waterloo, for through systematic cross orders the stockpool and mill-rings succeeded in bringing certain shares to very near the low points put out by insiders through their capers before the brokers combine forced them to enter the market as buyers. Outside shareholders who took advantage of the recent rise in prices and sold, have caused to congratulate themselves in the success combine forced insiders to put up the market contrary to their prearranged plan for lower prices. The fight between inside stockpools and mill-rings and the brokers combine is far from ended, and judging from the action of the market the past two months, the outsider who sells when stocks move up, will have no cause for regret. The mines are all right but it is the Comstock system of apportioning bullion to insiders and assessments to outsiders, that is all wrong, and until this is rectified no large up movement in the sharemarket can be looked for.

It looks as if the Quibtoia mine managers are apt pupils of the Comstock mine managers, for the Peer Mining Co. has sent considerable bullion to this city, and it is said has more to come forward, yet a 10 cent assessment was levied on yesterday.

The impression gains ground that in M. W. Fox's suit against the directors of the Hale and Norcross M. Co. and owners of the Nevada Mill & M. Co. the taking of testimony will be through with to-morrow and March 14 is set for argument. So far the defendants have not aided their cause in the testimony of their expert witnesses when subjected to a vigorous examination by W. T. Baggott, the plaintiff's attorney.

The fight for the control of the Hale and Norcross mine does not appear to be ended. Experienced Comstock miners and well informed stock operators are outspoken in their opposition to Mr. Flood getting control. They point to well credited information that the north end Flood and Mackay mines, should be paying dividends. They say that the statement made by Mr. Suro of large deposits of good millable ore in Ophir and two of the other North End mines is thoroughly correct, provided the Con. Virginia Mining Co. has not confiscated it and milled it as their own ore. They also claim that the mill reducing the Con. Virginia ore has an annex, and it is for this reason that car sample assays are not given. The very rich ore reported by Senator Fox when superintendent in Con. Virginia, between the 1300 and 1500 levels is there yet. Why is it not extracted?

Mining shares opened this morning weak but fairly active. After Call, the market shaded off under cross orders, with Hale and Norcross selling down to 8 1/2 cts. Observers and usually well-informed operators there is a well-grounded belief that the market is about bottom for the present, and those who buy and are satisfied with a fair profit will come out ahead. It is thought that Con. Virginia will not move up as high as one or two of the other stocks.

From the Comstock mines, reliable private advices are confirmatory of rich ore being uncovered in Belcher and Crown Point. Official letters do not mention this news, but as prices for the stocks have gone down, it is accepted as proof positive of the private information being correct. Insiders invariably break the market when ready for an upmove or when a rich strike has been made. In the North End group, no effort is being made to develop the rich ore on the 1300-foot level in Sierra Nevada. In Mexican, on the 1465-foot level, near the Ophir line, they have run into the rich ore found to the west about three years ago, at the time the stock went to \$9 a share. In Con. Virginia they are developing for easy working, the various levels extending down from the 800 to the 1300-foot level. In Savage, on the 300-foot level, private advices report them in six sets of timber of good grade ore. In the latter part of 1891, the Virginia Enterprise reported as follows about the work in the Savage mine:

At a point 74 feet north of the south line on the side of the north drift 1500 level, fair-grade ore was encountered, and followed 12 feet, when the drift was turned about 45 degrees to the west, leaving the ore to the east. The drift is about 24 feet farther than the point where they left the ore, and night before last rich ore appeared on the west side. It is pretty certain that the latter strike is the downward continuation of the ore cut into by two west crosscuts on the 1400 level, at a point about the same distance north of the south line. The character of the rock is clearly in every respect, and it is about as rich.

In the same issue the Enterprise said: "Taking the mineral belt from and including the Gould & Curry south to and including the Exchequer—below the 1300 level—a section is opened for prospecting that cannot fail to awaken interest because of its great possibilities, and with the exception of the Bullion, a section that has yielded a great deal of money from the upper levels in years gone by."

Official letters from the Bodie district report an improvement in Mono, and that the mill will soon start up on Bodie ore. Bulwer continues to yield its regular quota of rich ore. The management of Summit

is conforming to the law by giving the width and assay value of ore found. The assay will soon commence hoisting ore. Official letters from the Tucson and Quibtoia districts are about as heretofore reported.

THE ALAMEDA COUNTY BOARD OF TRADE has passed resolutions in which they say that they are in sympathy with the amicable movement of the miners and farmers of California toward the rehabilitation of the hydraulic mining industry on the basis proposed, believing that the interests of the whole State will be greatly benefited by the increased gold product which would result from a reopening of these mines. They also respectfully urge upon Congress careful consideration of the report of its Commission of Engineers, and of the memorial and resolutions of the State Miners' Convention, to the end that these mines may, as soon as possible, be again operated.

SIERRA COUNTY miners will hold a meeting in Downieville March 6th to organize a branch miners' association.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Lignite; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scoriafication; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; Assay of Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 130 12mo. pages, with illustrations, well clothed in 1892. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhard's Method; Manipulation; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

Assessment Notices.

KEYSTONE CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of work, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Saturday, the 30th day of January, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 310 Pine St., San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 7th day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the 28th day of March, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.
By order of the Board of Directors,
J. H. ISHAM, Secretary,
Office, No. 310 Pine St., Room 43, San Francisco, Cal.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.—Location of principal place of business, San Francisco, California. Location of work, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 24 day of February, 1892, an assessment (No. 2) of One (1) Cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, 308 Pine Street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the seventh (7th) day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the twenty-eighth (28) day of March, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.
By order of the Board of Directors,
W. J. GURNETT, Secretary,
Office, 308 Pine Street, San Francisco, California.

M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.
CHAS. H. OSBORN, Secretary,
Office, Room 56, Nevada Block, 809 Montgomery Street, San Francisco, California.

The Explorers' and Assayers' Companion.

A Third Edition of selected portions of the "Explorers', Miners', and Metallurgists' Companion."
A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying, and Metallurgy.
Price, \$3.00 post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.
By J. S. PHILLIPS, M. E.
The work is divided into four parts—Rocks, Veins, Testing and Assaying. The geological chapters are intended to give miners a practical idea of the various formations. The chapters on mineral veins are derived from long observation, and the section on exploration has been carefully considered. All that relates to discrimination and assay of minerals has been kept as free from formulae as possible. The work is written for practical men, and all the explanations and descriptions are clear and to the point. It is so prepared that it is useful to uneducated men as well as scientists.

A MINE WORKER
WANTS TO ENGAGE FOR PERMANENT WORK as a head in the mine, or in such other position as his employer may find him most useful. Has had good experience and will give good reference. Correspondence solicited. Call on or address "W. M." office of this paper.

THE ORIENTAL GAS ENGINE

IS THE BEST, because it combines simplicity of construction with power and economy in space. It can be run with natural or manufactured gas or gasoline at a cost of 20 to 25 cents per horse power per day.
It can be used for pumping purposes, as well as for all purposes where a perfect engine is required, with the advantage of lessening the risk of explosion. No licensed engineer at a high salary needed to operate it.
Send for circulars and prices if a good safe engine is what you need.

The Oriental Launch is Perfection.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a bigger percentage of sulphurets.

NATIONAL ROCKER QUARTZ MILL.

KENDALL'S PATENT, AUGUST 24, 1886.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL

FRUE ORE CONCENTRATOR

OVER 3000 IN ACTUAL USE.

We are now manufacturing these machines in different styles. The regular Four-Foot Plain Belt Frue Vanner is on the market now in its latest and most improved form, having several improvements on it that facilitate the work, altogether making it a perfect machine.

We are also manufacturing a Four-Foot Frue Vanner with a belt having an improved surface which doubles its capacity. This machine is as perfect in every way as the regular machine, and with its improved belt, it has double the capacity of the ordinary machine. We have sold a large number of these machines, and have demonstrated that they are a success.

The above figures of the number of machines that we have sold tell the tale of their popularity, and show that they have made their reputation by doing their work perfectly.

For any further information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.

Manufactured under Patents of April 27, 1880;

September 18, 1883; July 24, 1888;

and March 31, 1891.

Price of Plain Belt Frue Vanner, \$575, f. o. b.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

F. A. HUNTINGTON.

— MANUFACTURER AND DEALER IN —

MINING MACHINERY.

HUNTINGTON'S IMPROVED ROCK-BREAKER.

The Main Features of this Machine are Strength, Ease of Adjustment, and Simplicity of Construction.

The movable jaw A is worked by the eccentric B and is pivoted at the bottom. The stationary jaw D is secured at the top by a bolt running through it, and at the bottom hears against the heavy bolt C. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt C and the jaw D. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

HUNTINGTON'S PATENT ORE FEEDER.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet-crushing and gold saving it has no equal.

I CLAIM SPECIAL MERIT IN THAT FEATURE OF THIS SYSTEM WHICH PREVENTS ALL FLOURING OF GOLD AND QUICKSILVER, and the consequent loss of gold that attends stamp-milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S PATENT SHINGLE MACHINE.

This machine is so well and favorably known by all the principal lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed works has placed it far ahead of all competitors. Send for Circulars.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

VOL LXIV.—Number 10.
DEWEY PUBLISHING CO.

SAN FRANCISCO, SATURDAY, MARCH 5, 1892.

Three Dollars per Annum.
SINGLE COPIES, 10 CENTS.

An Industrial Plant.

The Union Forge and Gun Company has been incorporated in this city, for the purpose of manufacturing guns, plates, armor, bars, shot, shell and forgings, or to conduct all business incident to such manufacture. The capital stock is \$2,000,000, of which \$535,000 has been subscribed by the Directors, as follows: Irving M. Scott, H. T. Scott and James O. B. Gunn, \$100,000 each; Henry L. Dodge, Geo. C. Perkins, Millen Griffith, \$50,000 each; J. W. Knowles, \$25,000; L. B. Benchley and C. A. Spreckels, \$20,000 each; James B. Stetson and Charles Holbrook, \$10,000 each.

Although the plans of this company depend to some extent on the project to establish Government gun works at Benicia, still they will be carried out even if the Government plant goes somewhere else. The Government in establishing such plants does not make steel and forgings for the works, but gets them elsewhere. Outside of gun-work, however, armor plates and other steel will be made.

Already the mine where the iron is to come from for making the steel has been bonded. It is intended to use gas fuel entirely, and plans and estimates are now being prepared. A shipload of coal can then be landed at one place, gas be produced from the coal, and this gas used wherever desired in the works.

A plant of this kind will add greatly to the industrial importance of this city and give employment to several thousand men. The names of the projectors give sufficient guarantee that this is not a mere scheme on paper, but one which will be carried out in the near future.

CONFERENCE DELAYED.—The mining delegates from California to Washington were to have had a hearing Wednesday before the Senate Committee on Commerce, but owing to the indisposition of Judge Searles, it has been postponed for a week.

A NUMBER of ladies have taken out membership certificates in the Placer County Miner's Association. The membership of the Association has reached 542.

Mining Exaggerations.

The Colorado people know how to boom their mines and mining camps, and they keep on doing it so persistently that they make many people East believe there is no other place to mine with profit except Colorado. Their papers all have "mining columns," and the whole mining business is well advertised. They put up a Mining Exchange building in Denver a short time ago, and dispatches were sent all over the country calling attention to the fact that it was the only Mining Exchange building in the country. This did not happen to be a fact, however, as there has been one in this

Cons. Virginia. And the latter mine has paid a good many smaller ones since.

The Mollie Gibson is a good little mine and paying very well, but its whole dividend record put together is very little over one month's dividend of either of the two big Nevada mines mentioned. When it gets altogether one quarter of what the Cons. Virginia or California did, it can be called a big mine.

The people who start such paragraphs must be unfamiliar with mining history. There is a tendency to make these exaggerations which only renders their originators ridiculous to those familiar with mining history in this country.

Silver-Lead Smelting Plant.

When carbonates of lead or copper or metallic copper ores contain a sufficient percentage of those metals to smelt without the addition of any other other flux, their treatment in a water jacket smelting furnace is the simplest possible form of smelting, sometimes requiring nothing but fuel and ore. Frequently the percentage of metals is too low to smelt, or the ores may contain copper pyrites and glance and galena.

In preparing the last-named ores for the furnace, miners are met with the complex side of the smelting process; mixtures of

iron ore, limestone or silica are found necessary, and to determine when they are required, and how much of each must be added to the ores, is the problem that must be solved to work these ores successfully.

It often happens that ores of a different character are at hand, which flux each other to a great extent, in which case they are mixed together as required and then the necessary flux added.

The accompanying plate is an isometrical view of a galena silver smelting plant, equipped with Baker blowers, improved Corliss engine and boiler and sectional

water jacket smelters of large capacity. This may properly be termed a modern smelting plant, and embodies all the latest improvements, as arranged by the Risdon Iron and Locomotive Works of this city.

LARGE assays from ten-foot "shafts" continue to be reported from Oreede, Colo., but no producers that amount to much are yet in operation. A good many men are going to the camp, and a good many are already there.

EL DORADO COUNTY now has a County Miners' Association. J. J. Crawford is President; Thos. Fraser, Vice-President, and G. A. Richardson, Secretary. This is a branch of the California Miners' Association.

OREGON and Washington Senators are making a strong fight to get the Government gun plant put up on Puget Sound or the Columbia instead of at Benicia, in this State.

A MODERN SILVER-LEAD SMELTING PLANT.

city for 20 years or so, and which cost some \$750,000.

And now comes another Colorado wonder, in the form of a mine, which, in ten months, has paid dividends amounting in the aggregate to \$1,200,000. It began last April, and last month paid \$300,000. In March it is expected to pay \$400,000. The dispatches claim, as the Colorado papers doubtless state, that this latter amount is the largest sum ever paid in dividends in one month by any silver mine in the world.

It happens however, that the Consolidated Virginia mine of Nevada paid 34 monthly dividends of \$1,080,000 each, and the California 26 monthly dividends of \$1,080,000 each, between 1875 and 1878. The Belcher and Crown Point dividends of 1873 and 1874 varied from \$200,000 to \$1,000,000 each per month. These are all Comstock mines, in Nevada. The Mollie Gibsons single \$400,000 dividend does not come half way up to a single one of the 34 dividends of the

It was only a few years ago that a gold bar worth about \$100,000 was made in Helena, Montana, and shipped for exhibition to Minneapolis as the largest gold bar ever made. It was from the product of three mines. The MINING AND SCIENTIFIC PRESS at that time called attention to the fact that a bar worth \$114,000, or \$14,000 more than the Montana one, had been exhibited in this city in 1882, and was made from one run of the North Bloomfield hydraulic mine. Still, the Montana bar went off for exhibition, but went under false pretenses.

Both California and Nevada have done some few things in mining which the newer regions have yet to accomplish. California has passed the billion mark in bullion product, having turned out in gold alone \$1,260,000,000. Nevada has a dividend record from its Comstock producers which has not yet been equaled by any other camp in the country.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—ED.

The Gold Fields of Idaho.

A Placer Mining Boom in Lemhi County.

SALMON CITY, IDAHO, FEB. 16, 1892.

TO THE EDITOR:—Judging from the substantial developments at the present time being prosecuted, and the numerous schemes now under way and projected for the early spring, it does not require a very deep mental effort to foretell the coming of very very lively times among the placer mining interests of this portion of Idaho in the near future; and it looks now as if the prophecies and reports which the writer has occasionally made, through the columns of the PRESS, regarding its wonderful mineral resources, were in a fair way to be thoroughly investigated and verified.

The principal company at the present time in active operation, and whose wonderful discoveries have created so much interest in the placer mining business, is known as

THE LEMHI PLACER GOLD-MINING CO.
(LIMITED).

This company was organized last fall, in Denver, under the State laws of Colorado, capitalized for one million shares at a par value of five dollars each. The company is largely composed of prominent mining men of Denver, Colorado Springs, Leadville and Aspen.

The property is ably superintended by Mr. W. S. Patterson, formerly of Denver, who introduced it to the present owners, and it is situated about six miles northeast of Salmon City, on Kirtley creek, a small tributary of the Lemhi river. The company commenced by purchasing what was known as the Compton and Dougherty old channel diggings, comprising a claim of 120 acres, for \$20,000, which was paid over last October. To this they have since added, by purchase and location, sufficient territory to make a block of claims comprising about 4650 acres, which stretches back over the higher gravel hills and benches to the north of Kirtley creek, covering the possible line of any other ancient channel, which present developments strongly indicate may exist.

The company has had a force of men sinking prospect holes on each claim, and it is estimated that the whole block will average about 30 cents per cubic yard, with hardly any waste ground. The solid foundation bedrock has never been reached yet. They come down on to strata of cement-gravel and hardened silt, each of which is gold bearing; and judging from the lay of the land, they will probably have a bank of material two or three hundred feet deep in places, that will pay to wash. Their best pay is found in a bed of greyish colored gravel, about 20 feet thick, situated at the head of the narrow cut, in a shallow draw that puts into the main creek where Messrs. Compton and Dougherty first made their discovery. The course of this bed of gravel runs across the course of the draw, and about parallel with the main creek, and dips at a slight inclination back into the hill. It is quite extensive; has been traced a long distance; and, on numerous tests so far made, gives an average yield of over five dollars per cubic yard, in coarse gold, mostly on the flat order, from the size of flax seed up to that of a watermelon seed, and there have been heavier pieces found.

This same kind of gravel shows up at different points on the company's ground for nearly a mile back from the outcrop of this bed, and over 700 feet higher in altitude, where it is equally rich. And it is amusing to hear some of the old timers, at present in the employ of the company, describe the great ignorance they displayed in delving along the course of the main creek, only making \$2 or \$3 per day, when there was dirt on the adjacent hills that they could have hauled to water and rocked out an ounce per day to the man.

The writer gave a description of these diggings in a letter to the PRESS in January, 1891, when they were finding coarse gold right in the black loam. I suggested then that there must be an ancient channel near by that produced it, as it certainly could not have come very far and remained so near the surface, and there were various theories advanced regarding its origin; for at that time they had only found it in one of the shallow draws, on the side of the main creek. It was thought by a good many to have been derived from an ancient river channel, which is well defined in places, running parallel with, and close up to, the main range; and it may have been one source of the gold. But recent developments indicate that a good deal of it came from the numerous gold-bearing veins and reefs that cross the spurs and deep gulches putting down

from the main range, near at hand. There is a claim called the "Shylock," located on one of these veins, about one mile above these placers, the cropping of which has produced ore specimens, with heavy pieces of native gold attached to them, one piece of which weighed as much as 40 cents, and I have examined some flat nuggets taken from the placers below, that showed a dim outline of the same dendritic markings as on the quartz gold.

This vein can be traced across the canyons, with formation and ore to match on both sides, and has been eroded out 1000 feet deep in places, while the gravel foothills below are strewn with the same kind of iron and copper-stained quartz, wash and float that the veins carry. The pay in these placers will probably be found in a succession of benches or terraces, representing the ancient and more direct courses of these streams, for it is a notable fact that of five creeks putting into the Lemhi river from the main range, each carries a big hydraulic prospect. The bars occur on their northwesterly side in each case, and the present creek channels turn at a sharp angle to the southeast, up stream on the Lemhi, after leaving the rocky canyons and entering the foothill formation, indicating that their courses were at one time more direct from the canyons, which point generally in a southwesterly direction.

This company has left a contract to Messrs. Parsons and Winters, the noted railroad builders of Butte, Montana, for the construction of a ditch to be ten feet wide on the bottom and three feet deep, to convey the waters of Carman Creek over to their diggings, the several branches of which, collectively, can supply from three to ten thousand inches during three months of the year.

This ditch line is twelve miles long altogether, one-third of which distance will have to be flumed. The first section of five miles, covering the two first forks, is to be completed by the last of May. It comes around over a low divide that separates the two creeks, and covers most of the company's high ground; the end of the ditch line being fully 1000 feet in altitude above their low bar. The company has also secured a water right of 20,000 inches out of the Lemhi river, the taking out of which is at the present time under consideration. This, together with ample dumping facilities, secures all the requisites for an extensive hydraulic mining operation. The contractors have been busy all winter. They have 40 men and 16 teams at work, and are rushing the business right through, while the company have got in a sawmill of their own which has a capacity of 25,000 feet per day, and it is kept busy at the present time making lumber from logs obtained in the adjacent gulches. They estimate it will require over 2,000,000 feet for their flume construction and other work.

Their operations give employment to about 100 men at the present time, and as their camps are situated within a few miles of Salmon City, with goods roads to get around on, these operations give a healthy impetus to the general business interests here, and reflect much credit on the judgment and foresight of their genial superintendent, Mr. W. S. Patterson, who set the enterprise in motion. We are also fortunate in getting Colorado capitalists interested in our mines, for their nifty and successful ventures in mining matters in their own precious soil, and elsewhere, continue to challenge the admiration of the delving world; and I believe it is the earnest wish of this community that their dividends may roll in from this venture when they get it in full working order, proportionate to the magnitude of the enterprise.

THE BOHANNON BAR,

The principle portion of which was recently bonded to Mr. Wm. G. Shedd, of Denver, is probably one of the safest gold mining investments, if intelligently handled, that ever was offered to the investing public, if gold is in the ground and the natural facilities for getting it out can make it such. This property was fully described in my last letter to the PRESS of June 13th, 1891. It is situated on Bohannon Creek, about five miles across the hills from Kirtley Creek, on the same side of the Lemhi, and constitutes an even stretch of low bar ground, with good grade, about six miles long by nearly half a mile wide to the base of the adjacent hills, which are largely gravel banks, corresponding to the high bars on Kirtley Creek. Bohannon Bar has been worked for over 20 years in a small way, with the creek water in the spring season, and by drifting and rocking; and is quite extensively opened at different points by shafts, drifts and pits worked out. One of these pits, comprising something over 35 acres all in one block, and situated at the lower end of the bar farthest away

from the mountains, paid on an average over \$5000 per acre. The whole bar is said to have produced over \$600,000, all told, and it is estimated that there is still 1500 acres in the low bar alone that will pay at least at the same rate. The gravel is from 12 to 20 feet deep, with very few large boulders; and the gold is on the thick plate order all through it, with small nuggets on bed rock, which is a soft sedimentary formation and easily cleaned. It of course requires water from the Lemhi river to make this a large paying proposition for a big company; and it will cost considerable money to bring it in. But such cost will be a mere *bagatelle* compared to the amount of gold contained in the ground, with an unlimited supply of water and two pairs of heavy monitors working both ways to bed rock flumes against a double breast along the course of the bar. They could sweep off an acre of this gravel in short order. Mr. Shedd took the hint from the Lemhi Co. and secured a large tract of the high bench land on the northwesterly side this bar, which track covers all old channel possibilities here, and secures excellent dumping ground in two or three directions. He has a crew of men at work at the present time prospecting the high ground, and they are meeting with very flattering results. They have discovered a bed of fine-looking gravel, with a sediment rock capping, that bears the same relative position to the lower bar, as the rich channel does on Kirtley Creek; and carries a fair prospect to start with. They will run a drift across it, and feel very sanguine of striking an equally rich course. Mr. Shedd has also secured two other valuable groups of claims, on Sandy and Carman creeks, and is in Colorado at the present time interesting strong parties in all of the territory located and controlled by him.

Across the range, 15 miles west of Salmon City in the

LEESBURGH BASIN.

There is a very bright prospect of that old camp taking on a new lease of life and renewing its golden fame.

At this place Mr. John L. Armit, of Colorado Springs, has tied up for an English company, some large tracts of valuable placer ground, with water privileges, including a long stretch of virgin territory on the main Napiers creek, owned by Messrs. Tingley and Barracks of Salmon City. Also the "Bull of the Woods" property at the lower end of the basin, a detailed description of which was given in my last letter to the PRESS. Mr. Armit has had surveyors and experts on the ground getting matters in shape, and making practical tests of cubic yard samples. It is reported that they have a long stretch of ground on the main creek, above the old town, that runs \$12 per cubic yard for several feet above bedrock, which, by concentrating the water interests at this point, can readily be made to yield handsome returns.

It has been the opinion for years of old timers who have worked in these diggings, that if the "Bull of the Woods" should ever fall into the hands of a company able to drain the ground, it would make one of the best-paying institutions in the country. This property covers about three miles of the main Napiers creek, from the falls up. The ground lies very flat, and will require a bedrock tunnel probably 300 or 400 feet long to drain it. This is the reason it has never been worked before. Where bedrock was first struck up this stream above the head of the falls, it paid half an ounce a day to the hand, in ground sluicing, and from that point up, this creek and its short tributaries and bars, embraced within an area about seven miles long by three miles wide, has produced since 1866, \$10,000,000 worth of gold dust. The rock to be driven to drain this property, is soft granite and conglomerate that ought to work easily. When this drain tunnel is put in, they will have the advantage of a dump that falls away about 2000 feet in two miles, and an abundant water supply that lasts all through the season, already on the ground.

THE PANTHER CREEK

And Prairie Basin placers, situated about 25 miles southwest of Leesburgh, are attracting considerable attention at the present time with some New York and Chicago parties. A company which has been organized, has a large tract of ground carrying a big hydraulic prospect through the gravel, and coarse gold on bedrock, with a large stream of water and other natural facilities on the lower creek. Farther up in their Prairie Basin and Silver creek ground, the gold is on the scaley order, and low in grade, being nearly half silver, and according to old timers who have tried to work it, hard to save. This assertion is borne out by some of their old tailings, piles which pan nearly as well as the bank, and give a prospect that would pay at the rate

of an ounce a day to the man if the gold was as easily saved as that from most any other part of the county, hardly any of which runs less than \$18 per ounce. But Mr. N. L. Turner, the leading spirit of this enterprise, who is a Snake river miner and an expert on fine gold saving devices, claims he can save every color of it without difficulty. The bedrock in this basin is mostly porphyry, and there have been threads of ore found in it that showed beautiful specimens of native gold and wire silver.

YELLOW JACKET CREEK

Is a tributary of the middle fork of the Salmon river, which heads up against Prairie Basin. There was a report came over from there last fall that some prospectors had found a pay channel in a flat below the Yellow Jacket quartz mine, that yields on an average four cents to the pan near bedrock. This creek was the scene of a stampede in early days from Loon Creek, when 600 men rushed over in one day on the report of rich diggings having been struck, but they did not pan out to suit the ideas of miners of that period, when wages were six dollars per day. But four cents to the pan will probably prove a profitable prospect under present methods of placer mining. The Yellow Jacket quartz mine is probably one of the biggest free gold quartz propositions in the West. The vein is from 40 to 60 feet thick in a contact between granite and quartzite, and can be traced through the entire length of seven full claims; and the mountain is thickly strewn with quartz, in places for 600 feet in width. The company owns 14 claims, four of which are patented. The connected developments amount to 2000 feet in length on the vein, and 300 feet in depth; and the vein can be tapped at 1000 feet in depth by an adit tunnel. It is equipped with a perfect ten-stamp, free-gold mill, which has been running steadily now for nearly four years, crushing quartz just as it comes out of the mine, without sorting, that pays on an average ten dollars per ton; and carries five per cent of concentrates that assay \$250 per ton. The mill is run by water power. The company has saved its tailings, and will put in a concentrating plant next season to work them. It also has immense reserves of ore in sight, and is contemplating the erection of another mill with 50 stamps. This property was one of the early ventures of Mr. J. B. Haggin that did not pay (owing purely to mismanagement) and laid idle a long time, until it was purchased by Messrs. Morrison, Stein & Co. of Bonanza. Mr. Stein, who personally superintends the operation of the property, is a thoroughly practical miner and millman, and under his *regime* it has been transformed from a dismal failure to one of the most profitable and promising gold mining operations in the State. This mine is situated at a distance of 120 miles from a railroad, the nearest point being Red Rock, Montana. There is a report of some recent discoveries near the Yellow Jacket, in silver lead and free gold ores, that are too big to tell about without a personal investigation.

There was a packtrain load of ore shipped from the Perkins mine in that district last fall that ran 200 ounces in silver and 40 per cent lead.

THE RAILROAD PROJECT,

Which seems most likely to relieve the pressing needs of this section of country for cheaper transportation, is known as the Butte and Boise Short Line, and there is a very bright prospect that it will be built. The preliminary surveys for this line were made last summer by Mr. O. L. Miller of Boise, and a corps of engineers. The route was found to be quite feasible, in fact much more so than was at first anticipated. From the time it leaves Boise till it reaches Butte, it passes through and near by one continuous string of mining camps that would be capable of furnishing an immense traffic. The lumber, grazing and agricultural resources of the route are also very extensive; and if it is built, the trunk line it transfers to at Butte, will acquire one of the richest feeders in the northwest.

THE GIANT GROUP

Of placer claims, situated on the gravel foothills on the west side of Salmon river, six miles below the mouth of the Lemhi, was discovered last fall, and is one of those strikes that call forth the stereotyped expression, "Who would have thought it possible that anybody would ever find pay in such a place as that?" because it is situated near regularly traveled roads and trails, like miles of other territory fringing the Salmon and Lemhi rivers, which, to all outside appearances, ought to carry pay just the same. The foothills where this property is located, are comparatively steep. The ground is not fabulously rich, so far as tested, but gives great promise of big development. The gravel is quite shallow down at the lower end of the

claims near the river, but the water has cut down in places farther up on the hills, and exposed much deeper channels. The gold is coarse and almost as round as shot, and seems to be scattered all over the ground, both ridges and gullies alike. They made some test runs last fall, having not to exceed 40 miners' inches of water to work with, and it paid at the rate of \$3 per day to the man for the work done; and among the gold thus produced were two smoothly-worn nuggets that weighed \$5 and \$3.50, respectively. The owners were so well satisfied with these results that they at once commenced the construction of a ditch from a creek near by which is now nearly completed, and will give them a thousand inches of water. They have got all the necessary appliances for hydraulic operations on the ground, and will work the gravel very rapidly when the season opens. This property comprises about 500 acres, and is owned by Messrs. White-well and Cummings of Salmon City. Mr. Cummings also owns a group of patented free-gold quartz mines in these same foothills, a little above the placers in altitude. The veins are from two to five feet thick in a soft talc slate, above granite, and are developed to a depth of about 150 feet; and by a working test, yielded at the rate of \$20 per ton. Besides the enterprises already mentioned there are

NUMEROUS OTHERS

That give great promise of future values, prominent among which are the mines of the North Fork, the Carman and Freeman creek bar claims, the Salmon River group, situated between Carman and Kirtley creeks, the Three-Mile group, the Geertson creek property, between Kirtley and Bohannon creeks, the Sandy creek and Pratt creek bars, and others, comprising tracts of from 160 to 3000 acres, each of which has been proven, either by prospect holes or actual working tests, to contain rich ground for hydraulic operations. Nearly all of these claims come under the altitude of the upper reaches of the Lemhi river and its larger tributaries. There has been about 40,000 inches located on these streams by thoroughly responsible parties, and it is probable that there will be a "water company" formed in the near future, to bring out a big ditch to cover a good deal of this ground. It is a good country to construct a ditch in; excepting a few deep gulches to cross. There is also some ground where the altitude does not exceed three or four hundred feet above the river, which might be supplied with a thousand or fifteen hundred inches, through an inverted syphon pipe. The river has an average grade of 50 feet to the mile.

It will be seen from the foregoing that we have a "sure enough" mining boom; and if half the schemes that are at present germinating should assume the shape of working organizations, it will be a "hummer" by next fall; and should the principal companies now in the field confine themselves to a legitimate and conservative policy, their operations will result in the development of a mining region that will make "all the world wonder" how it could have remained so long undeveloped. The gold fields of this portion of Idaho are very extensive; there are thousands of acres of placer ground that will pay from 10 to 50 cents per cubic yard, and which, under the lubricating influence of capital and enterprise, can be made to add a million or two dollars worth of gold to the annual output for a long series of years to come, and after the railroad gets here—for it cannot much longer resist the metallic attraction of this country—that amount will be doubled up several times over in baser bullion. As it is interesting and indicative to many mining men to know what a given section of country has done for itself, it might not be out of place here to state that there is already recorded to the credit of this section of Idaho, embraced within the original limits of Lemhi county, a placer gold production of fourteen million dollars; a single quartz property that has produced five millions of dollars, half of which was clear profit, and the mine—the General Custer—is still producing; a single silver mine that has produced about three millions, and is still producing at a depth of over 1000 feet—the Ramshorn; two of the richest specimen mines in the world—the Montana and the Charles Dickens; a lead mine—the Viola—that produced three million dollars worth of bullion, at a profit of 30 per cent; and one of the deepest free gold mines in the State—the Kentucky,—800 feet down on the vein. These are a few samples of the successful mining operations of this section, which ought to create a favorable impression, considering that they are all situated in a rough, mountainous country, at distances ranging from 60 to 150 miles from a railroad. Of course, we have the usual leavening of failures, many of which might have been averted

if they had fallen into the hands of capable and honest operators. There is a large extent of territory in the central portion of Idaho, accessible by this route, that is worthy the attention of mining men in every branch of the fascinating business, from that of the prospector to that of the capitalist; and we hope to see the stage road from Red Rock, Montana, kept warm the coming summer with the wheels of their conveyances.

R. B.

El Dorado County Slate Quarries.

ALAMEDA, Feb. 27, 1892.

TO THE EDITOR:—The frequent mention of the El Dorado county slate quarries, in the columns of the MINING AND SCIENTIFIC PRESS, has done much to attract attention to this industry, and it is now probable that a thorough development will shortly ensue.

"Mineral Resources of the United States" (Government printing office, 1890) contains a suggestive paragraph, page 548, which I think deserves notice:

"The exports of roofing slate from New York show a very large gain, as indicated by the following tables: The increase in the amount exported to British Australia is particularly noticeable, the figure for 1887 being 2,203,551 pieces, while for 1888 it is 4,125,858. This favorable competition with England in one of her own provinces must be very gratifying to American producers, as it probably means an advantage in quality as well as in price."

Since these statistics were published, the amount of slate shipped from New York to Australia has rapidly increased, England and New York now being about equal competitors; and were the Californian quarries properly developed, I am satisfied that they could compete successfully in that market.

In quality, this slate is inferior to none, its elasticity, toughness, cleavage and permanency of color leaving nothing to be desired. This statement can be readily verified. The present workings are less than three miles from the Placerville railroad station, on the county road from Placerville to Georgetown, and upon one of the finest water powers in the State. The strata are here almost vertical, rising from the river at an angle of about 60° to a height of 600 feet. Very little waste material has to be handled, the debris forming a broad platform on the river bank.

By utilizing a portion of the water power at hand, the slate might readily be placed on board cars at Placerville (by wire rope-way or otherwise) at a trifling cost, if handled in large quantity. The natural facilities for quarrying and the inexhaustible supply must be seen to be appreciated.

I have visited several of the larger quarries in Pennsylvania and Vermont, but in none have I seen slate of such width so readily accessible, Eastern quarrymen being often compelled to work considerably below the surface, necessitating the use of expensive hoists and pumps.

The freightage from Placerville to San Francisco is at present about \$3 per ton (carload lots). This rate cannot be raised, but on the other hand, the railroad company has frequently expressed a willingness to lower it, should shipments increase. The freightage on this class of freight from San Francisco to Australia is always much less than from England or New York to Australia, there being usually a difference of more than the entire cost of transportation from Placerville to San Francisco; therefore I am of the opinion that these slate beds will ultimately supply a portion of the Australian demand, as well as a largely increased amount on the Pacific Coast.

The present condition of the industry in this State is encouraging. Although not advertised or pushed in the least, the demand, at a high price, is much larger than the supply. I am informed that orders aggregating \$18,000 have lately been refused.

Slate has now many uses. As a roofing material, it has great advantages over shingles, tin, iron or tiling, but until recently was seldom recommended by Californian architects on account of cost, transportation rates from Eastern quarries and a high percentage of breakage in transit making the price almost prohibitory. In a mild climate, such as that of California or Australia, it loses its one disadvantage—that of liability to become loosened by repeated heavy frosts—and when once properly laid, practically lasts forever.

These slate beds are so situated as to permit of control by a single company, and had the industry been better understood and appreciated on this coast, they would not have so long lacked capital for development.

By avoiding the various mistakes caused by bad management and inadequate means, there is here an opportunity to build one of the largest and most profitable industries on the Pacific Coast.

M. INNES.

The Two Conventions.

EN ROUTE FROM DENVER, COLO., }
Feb. 19, 1892. }

TO THE EDITOR:—Your criticisms on my article, "The Two Conventions," were duly noted, and but for want of time would have been earlier answered. I will now say this: The land resolution was a very weak affair, and anything else than that was contemplated. and was placed before the Committee of Resolutions, and hence I say ruled out. The quartz-mining interest, as regards mineral claims on railroad grants, had not the least consideration, and, all things considered, it looked as if the railroad interest fared well.

Now, as to the silver question, when I say it was ruled out I know also what I am saying, as I sent in a resolution on the subject. You say there was none properly presented. To be sure, I might have presented one to the convention independent of the Committee on Resolutions, but expecting it to come from other quarters, I did not desire to be too officious. As a convention in the interest of hydraulic mining, it was a well laid out success, and I am glad of it, as hydraulic mining has no better friend than I am; but when it comes to a "Miners" Convention, its scope was altogether too limited, all things considered.

These criticisms are not to be considered as against what was done by the convention, only on what was not and should have been. Speaking of the silver question, it is the liveliest one to-day in every other State but California, and why it is not there is simply because California mining interests seem dead in comparison to what you find elsewhere. In Utah and Colorado, notwithstanding the great discount on silver, and, we may say, their labors, all is life and progress in comparison to California. In my conversations with travelers as I meet them, they seldom talk of California as a mining section good for capital or labor; it is all the time Colorado, Utah or Montana. And why? These sections have their mining interests cared for by the daily press. Take the Salt Lake or Denver papers, to say nothing of the press in the special mining sections, and you will find from one to three columns daily in reference to their mining interests. Not so in California. If the leading city press give a column, or part of one, once a week, they think this does well for the interest.

ANOTHER PROCESS.

But California's mining interest will soon be awakened by the incoming of the new process for the extraction of gold—the MacArthur-Forrest (cyanide) Process. This process is one of the wonders of the age. It reverses the order of gold extraction, making that which has been the most difficult to get by our usual process the easiest. This process is not only efficient in extracting a high percentage of gold and silver, but it is capable of being carried to an unlimited extent. In South Africa they are building mills for treating 8000 tons of ore a month, and several are being erected in California for working 100 tons a day. I have studied this process now for nearly a year and have made any number of tests on a large as well as smaller scale, and were I to give the results, it would wake California mining interests up. I visited one mill in Utah working 30 tons a day, also several in Colorado. Mills are going up in Montana and Idaho. The fact is, the process is going to override every other mode—lixivation, chlorination, concentration, dry amalgamation. Silver plate stamp mills and pan mills for silver ores will all in time yield to the merits of this new Scotch process.

All California miners know I have asserted over and over again that our Californian mills were not extracting on the average 50 cents on the dollar of their ore's value. The cyanide process will prove it so, and, furthermore, it will get 40 cents of the lost 50 for them on practical working. I say this much about the process in the interest of Californian miners.

I neglected to say that I had as traveling companions over, Judge Searls, Mr. Hobson and others, the committee en route for Washington for persuading an appropriation for dams, etc., in the interest of hydraulic mining. No better committee could have been selected. Their entertaining and personal qualities are great. In Denver I met Wm. M. Lent, so well and favorably known by all old Comstockers. Mr. Lent retains his enterprising and vigorous spirit, and his friends will be pleased to know that he is well, looks well, and full of "snap."

At present there is great excitement in Colorado over the very extensive gold and silver finds in Creed and Cripple creeks. People and capital are flocking in heavily from the east, west and Colorado. A very

large amount of capital is going in. The fact is, Colorado and Denver are all alive.
ALMARIN B. PAUL.

The Granite Mountain Report.

According to the report of the Directors of the Granite Mountain Mining Company for the year ending July 31, 1891, the balance in the hands of the treasurer at the beginning of the year was \$1,208.44. There were shipped during the year 2299 bars of bullion, containing 3,200,608 ounces of silver and 6468 ounces of gold, which sold for \$3,463,815.65, and yielding, after paying express charges, refining charges and commissions, \$3,380,226.54. There were also shipped 17.7 tons of furnace slag, containing 9425 ounces of silver and 19.64 ounces of gold, which sold for \$9,309.12. In addition, \$57,998.76 was received from the Montana department, making the total receipts \$3,448,742.86. The disbursements were as follows: Montana department for pay-rolls, supply bills, \$182,870.11; insurance, \$9870; salaries, office rent and sundry expenses, \$22,049.55; dividends, Nos. 68 to 79 inclusive, \$1,900,000; cash balance July 31, 1891, \$15,836.24.

COST OF MINING.

During the year 85,471 tons of ore were mined and delivered to the mills, at an average cost of \$5.734 per ton, divided as follows: Labor and superintendence, \$4.196; hoisting and pumping, \$0.786; timbers, \$0.323; powder, fuse, caps and candles, \$0.222; tools, \$0.111; miscellaneous, \$0.123.

In driving levels and drifts, the average cost (including timbering) per lineal foot was \$12.67; crosscuts, \$17.17; winzes and raises, \$16.61; sinking Ruby shaft, \$73.99; sinking Cleveland shaft, \$53.95; driving Rumsey tunnel, \$28.14. The cost of prospecting has increased slightly owing to increased depth of working.

COST OF MILLING.

The three mills crushed 72,622 tons (wet) of ore, or 68,850 tons (dry), and 10,807 tons (wet) of salt, or 10,645 tons (dry). The average moisture in the ore was 51.2 per cent. The salt and ore was mixed before crushing. The ore averaged 50.59 ounces of silver per ton, and the actual per cent saved was 90.7. The cost of milling was \$10 per ton (dry), divided as follows: Labor and superintendence, \$3.460; salt, \$1.988; fuel, \$1.644; quicksilver, \$1.123; castings, \$0.632; chemicals, \$0.289; water, \$0.136; miscellaneous, \$0.726.

A COMPROMISE.—An event transpired this week that goes a long way toward proving just how thoroughly disgusted some of the Park's claim holders are with mining litigation, and also sounds the keynote to a wise and judicious course in the future where conflicts exist between claim owners. First, the Park City Mining Co. and the Silver King people got together, talked over their differences and claims to ground in dispute, and finally came to an amicable understanding and settled the matter in a manner satisfactory to all concerned. Second, the owners of the Lief Erickson and Volunteer claims, which were also in conflict, held a consultation and decided to compromise their trouble and did so on the spot, all parties interested being perfectly satisfied. These two compromises take four suits at law out of the Third District Court, and will be the means of saving all parties many dollars for developments that would otherwise have gone to the lawyers. It was a wise move and a cheap one.—Park City (Utah) Record.

CAUSE OF THE CLOSING DOWN.—Rocky Bar (Idaho) Bulletin: We are informed by some of the Custer county boys who reside in the Cœur d'Alene mining region that the mines up there are liable to remain closed down for four months, and that 3000 miners are thrown out of employment by this operation, and they are leaving for Butte and Colorado as fast as possible. The main cause of the shutting down was the railroads. They would not grant the mine-owners a \$2 reduction per ton on shipments of ore and concentrates. The mines of that district, as a rule, produce low-grade ores, and in consequence cannot stand high shipping tariffs.

STANFORD UNIVERSITY PROFESSORS.—Advices from Madison, Wis., are as follows: C. B. Wing, Professor of Railway Engineering in Wisconsin University, has accepted a call to the Leland Stanford University. A. W. Smith, Professor of Machine Design, and L. M. Haskins, Professor of Pure and Applied Mechanics, have calls from the same institution under consideration. It is feared that they, also, will go. All are rarely good men. Both Smith and Wing came to Wisconsin from Cornell only last fall. Haskins is a local graduate.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WILDMAN.—About 18 men were laid off at the Wildman mine last week. The reason for this action, as far as we can find out, is that the ore on the lower level does not come up to the paying standard. Sinking is to be resumed, in the hope that better prospects may be met with.

THE CLINTON CONSOLIDATED is said to continue to look well. The high grade rock is reported to be eight or nine feet wide. A very large stock of all kinds of goods has been received at the store, also liquors for the saloon.

THE PLYMOUTH CON. started to work last week to pump the water out of the mine. There is 500 feet of water in the shaft, with the drifts below that, all full of water. To get out this immense body will take at least from one to two months steady pumping. This action of the company looks more like old-time scale of working than anything that has taken place since the fire over four years ago. At the Bellwether or Bright claim, they are making an upraise from the tunnel to the surface, a distance of 50 feet. This is preparatory to sinking a shaft alongside the ledge. The ore continues to look remarkably well. J. B. Francis, superintendent of the Clinton Consolidated, visited the property this week, and was surprised at the excellent showing. Samples of ore taken by him were assayed at Wieland, and yielded \$28 per ton. It is said to be the finest prospect, considering the depth, that has been found in the county for years.

Calaveras.

RICH STRIKE.—Calaveras Chronicle, Feb. 27: We have been informed that a rich strike has been made in the mine owned by the Shepherd Bros. and Byron Swank. The mine is situated east of Wiggins' sawmill, and about eight miles from San Andreas, and has only been in operation but a short time. A shaft has been sunk to the depth of 50 feet, and the bedrock has now been reached. Blue cement-gravel was encountered in the shaft at a depth of five feet, which good judges say will average \$5 to the carload, and the gravel is now 45 feet in thickness. The owners intend erecting water power hoisting works, and also put up a first-class stamp mill so as to work the mine on an extensive scale. It is without a doubt the richest strike that has been made in the county for years, and all the conditions are favorable for a large and permanent piece of mining property.

Inyo.

A GOOD SEASON ASSURED.—Inyo Independent, Feb. 26: Frank Fitzgerald came in from Modock on Tuesday's train, the object of his visit being to procure a big team to haul ore from Modock to Keeler. He confirms the report published last week of the good prospects for lively times in mining circles for the coming season. J. J. Gunn has a lot of ore ready for shipment at the Minnetta mine, and no team to haul it. Niel McLean has taken a contract, which will keep him busy for some time, to haul wood for Fitzgerald's mill. The Snow's Canyon mill is to be removed, and, with the addition of new pans and settlers, fitted up in first-class shape. The new road completed to Wild Rose, will open up a fine mining property there. As before stated, the prospects at Darwin are better than for many years past.

A MINING ENTERPRISE.—Inyo Index, Feb. 27: Frank Fitzgerald, the boss mining man of Inyo, came to town on Tuesday. He informs us that he has purchased the tailings of the old Minnetta proposition—aggregating about 4000 tons—and intends to work them. He has removed the old five-stamp mill from Snow canyon to Modock and added two pans. The tailings assay \$14 per ton, and Mr. Fitzgerald feels confident that he can save at least half that amount. He has contracted for the delivery of 300 cords of wood at Modock at \$12.50 per cord. This seems a big price, but as it has to be hauled 26 miles, it is certainly worth that amount. Mr. Fitzgerald expects to start the mill about the first of September, and will run it for all there is in it.

Placer.

DUTCH FLAT RICHNESS.—Cor. Placer Republican, Feb. 26: Through the center of our town runs a ravine that was at one time in the early days an outlet for some mines at the upper part of town. When the heavy rains cause high water, the boys get in and do some mining on a small scale, and always manage to pick up spending money. Some of the best mining ground in this section is right under the town, and many have a small fortune near their doorstep. If we ever get permission to mine, no doubt some will move to non-mineral land and turn their town lots into mining claims.

Mono.

THE BODIE CON.—Bodie Miner, Feb. 26: We will make a run on Bodie ore after the first of next month. There were employed eight miners, one carman, and jointly with Mono one engineer, one blacksmith, one laborer, one watchman, one foreman.

THE MONO.—North drift from top of No. 1 upraise, 100 feet above the 700-foot level, was extended 18 feet. We have a small seam of rich ore in this drift, which we are saving.

THE BULWER CON.—In this mine, stoping was discontinued several days ago, on account of the chutes being full of ore, and also because the Bodie Co. require the use of the mill for the purpose of making a crushing of their own ore. The mill is still pounding away on Bulwer ore, and it will take at least the first of next month to finish this crushing and make a thorough clean-up of the mill. While being deprived of the use of the mill, prospecting for other ore

deposits is being energetically carried on in virgin ground, where valuable discoveries are liable to be made any day.

SUMMIT.—The work of repairing the incline shaft is completed, and it is now in good working condition. The pipe to convey the water from the Lent shaft to the Summit hoisting works is already laid, ready for use as soon as needed. The boiler is in place and the machinery work is nearly finished. Steam will soon be applied, and under the new conditions work will be greatly facilitated. The extraction of ore goes on steadily.

Plumas.

TUNNEL.—Bulletin, Feb. 23: During the past two months, C. H. Clark has been driving a tunnel on the Light Pocket ledge, owned by A. C. Light of Taylorville. Mr. Clark leased the property for six months, beginning work the first of the present year. He has driven the tunnel 115 feet, and a few days ago struck the ore vein, which is small but looks well. Mr. Clark will continue the work. Some very rich deposits have been found in this mine, and Mr. Clark is liable to find more of them at any time. This week J. E. Smith, Supt. of the Sun mine, will go to Cromberg to resume work on that property. Ten or 12 men will be employed. The debris is dumped on ground owned by the company, none of it reaching the stream. Mr. Smith thinks they will be able to work all summer. The company, Oakland men, own about 300 acres of ground. From J. A. Edman, who was in town to-day, we learn that he has about 300 tons of ore broken in the Diadem mine. The mill was started Saturday, and will probably run all the season. The prospects of the mine are good. A large body of medium grade ore has been developed close by the old stopes. For several months past John Taylor has been driving a tunnel in the Round Valley Consolidated, near Greenville, to tap a vein of ore at greater depth. It is expected that he will reach the ledge in a few days. McIntyre & Warren continue work on the Blind lead at Wolf Creek. We are informed that it is the intention to erect a mill on this property during the coming season. It is rumored that much good ore has accumulated from the development work which has been going on in the Indian Valley mine. While in Crescent Monday, we learned that the large ore body in the Reward mine, Genesee Valley, had been cut at a depth of 500 feet. It carries copper, silver and gold, and assays very high. It is considered an important development, and may lead to extensive operations in that section next season. It is reported that Joseph Gruss, owner of the Genesee mine, has again started his mill. The ore is supposed to be very good. No doubt this is a fine property. It is known that much gold has been extracted and no fuss made about it.

NOTES.—Plumas National, Feb. 27: C. H. Olark, who leased the pocket ledge belonging to A. C. Light, near Taylorville, has a tunnel in some 120 feet. A few days since he struck a small vein of ore which looks first rate. We expect to hear of a rich pocket being struck before long, as in former years some rich places were found in this mine. J. A. Edman informs us that he has been working in the upper level most all winter, and commenced crushing ore the first of the week. The mine looks well, and he expects to take out some money this season. J. E. Smith will go up next week to take charge of the Sun mine, near Cromberg. This property is owned by Oakland capitalists. Some 10 or 15 men will be employed during the season. The Genesee mine, owned by Jas. Gruss, started up last week. This is a fine mine, and has paid the owner good dividends in the past. He is down a considerable depth, and some rich ore will be taken out this season. We learn that quite a body of ore has been cut at a depth of about 500 feet, in the Reward mine, situated near Genesee valley. It prospects well and is said to carry copper, silver and gold. If this is so, large operations may be looked for in that section before long. W. S. Dean came down from his mine, near Genesee Valley, the first of the week. He says the mining interests in that section are looking up both in copper and gold, and that the time is not far off when the copper mines near Genesee will form one of the industries of Plumas. At the Argonaut mine, situated on the North Fork, Foss and Mechling owners, a new tunnel has been run this winter, which has made some new and favorable developments that promise well. This mine is in a section that has paid rich in former years, and there is every reason to believe that the owners will develop a good paying property when once they get in. At the Bonanza drift mine, Schmidt & Gamble owners, a tunnel has been run some 480 feet, when gravel was struck, but the tunnel is too high, and water coming in so fast, no shaft could be sunk to bottom of the channel. There is no doubt but a rich channel will be developed in the future, but a new tunnel will have to be run in order to bottom it. There are about 45 men at work in the Thistle shaft. The Claybank mine, near La Porte, is being pushed ahead.

San Diego.

PICK AND SHOVEL.—Julian Sentinel, Feb. 25: The new boiler for the Helvetia will soon be put in place and the stamps set running again. The Kuester people have their new stamp mill nearly completed. They are also developing the Dora. The Ella mine is being put in shape by C. E. Smith and Geo. Plant; a new track and repaired car are among the improvements. The Ruby Co. continue to develop their valuable property. This mine bids fair to become a bonanza some of these days. The Cincinnati Bell and Gold King are at work as usual. A hoisting engine is expected to arrive soon for use at the first-named property. Al Frary and Robert Johnson have been busily at work clearing out the mouth of their tunnel on the Eagle that was caved in by the big snow.

Several properties that have lain idle during the winter months, it is expected, will now be started up, and a revival in mining matters is predicted for the coming season. Freight wagons loaded with pipe for the Bailey Bros.' Ready Relief mine and mill water system at Banner, passed through Julian Sunday. This is the first delivery of the immense amount of heavy freight that is to transform the Bailey Bros.' valuable properties into a wonderland of enterprise.

Siskiyou.

ALONG THE KLAMATH.—Cor. Arcata Union: The mining interests as a whole have been fairly good so far this season. The scenes along the river present one of activity, and the muddy color of the stream tells better than words of the various sluices dumping their tailings into its seething waters. Beginning ten miles below Martin's ferry, and on the summit of Morrock Hills, is the new mine of the Morrock Hill M. Co. The company has put on the water of Capbell creek and are prospecting a gravel deposit, some 2000 feet above the Klamath river. As this is a new departure to miners on the river, and freely criticised by many men having operations of their own, it is looked upon as a test case, and I hope will yield largely to parties interested, though all indications point the other way. Some Del Norte capitalists have invested in the enterprise, and though amateurs at the business, are willing to put up the necessary coin to give it a fair trial. This in itself is to be commended. This mine is located on the old sheep ranch of Lamb and Hadley. About one mile above Capbell creek, and on the north side of the river, is situated the Young mine, owned by the heirs of Captain William Young, a Mexican veteran. The property is leased to parties who pay a monthly rental of \$60, and, considering their mode of work, is doing fairly well. Directly across the river from the mouth of Capbell creek, and on the south side, is the location of Capbell Bar, a claim which promises to do well, from present prospects. About one-half mile above Capbell Bar, and along the river, is the mining claim of O. O. Quick, who has lately put on a 7-inch pipe and canvas hose, and is struggling through a streak of blue mud. The boys say when he desires to shut off the water, he throws his hat over the nozzle. One mile above the Young mine, and on the same side of the river, is the location of Moreop, a small mine, run on the plan of pick and shovel, and ground sluices. Located below the mouth of Tulley creek is Kanick, a promising bar, on which a water privilege has lately been filed and some work done, though no mining at this writing. At Witchpeak, we have the claim of William Lord, operated by Chinamen. The location is low and the harvest fair. One and a half miles above Witchpeak is the justly celebrated Saints Rest mine. The bar is pretty well worked off and the water low. Big Bar, the claim of mountains of tailings, is a total wreck. The ditch is gone, the sluice boxes covered up, and desolation marks every point of the once greatest claim on the river. A short distance above the Big Bar claim is the Bristol mine, owned by Lord and Allen, which is doing well. Some distance above the Bristol mine is the Red Cap mine, owned by Lord and Allen, and operated by A. H. Allen, a man of 20 years' experience, who, by his systematic method and thorough mastery of business, succeeds where others failed.

QUARTZ.—Yreka Journal, March 2: Clarence Davis and Arthur Scheld have started up their little prospecting quartz mill, made by themselves, and crush about 100 pounds of quartz per hour. It is located at Mrs. Steele's place on Yreka creek, just south of town, where they get the use of Scheld's water works' boiler for securing steam. The quartz crushed is hauled from Long gulch, about two miles north of Yreka, where W. W. Davis and James Mann have sunk down some 40 feet, the quartz showing gold to the naked eye in great abundance.

NEVADA.

Washoe District

CON. CAL. & VA. MINE.—Virginia Chronicle, Feb. 27: 1100 level—The upraise which was started at the mouth of the west crosscut No. 3, started from the main south drift, 310 feet south from the shaft station, has been carried up 37 feet; total height, 102 feet. From this upraise 73 feet above the sill floor, an east crosscut has been advanced 20 feet, the face showing some quartz of low assay value. The north lateral drift started at the shaft station has been advanced 45 feet; total length, 175 feet; in porphyry. 1500 level—The south drift which was started from the upraise 43 feet from the sill floor, which was carried up from the end of the crosscut run west 36 feet in from the south drift at a point 155 feet south from the shaft station, has been advanced 10 feet in quartz of low assay value. 1600 level—Have been retimbering and repairing the main south drift on this level, and are continuing the work of prospecting upward from the old sill floor. 1650 level—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the south-west drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise, carried up from the crosscut run west from the southwest drift, made connection with the stopes on the eighth floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift 70 feet north from the south line of the California ground connected with the eighth-floor stopes. 1800 level—Along the south end of the drift

running south from the crosscut run east from the winze No. 1, sunk from the 1750 level, we have continued to stoop out ore from the sill floor upward of milling value. There has been extracted from all parts of the mine during the week 1013 1530-2000 tons of ore, which was shipped to the Morgan mill. The average value of all of the ore worked at that mill during the week, 980 tons, was \$19.45 per ton. Bullion now on hand in our assay office, assay value about \$12,300. Bullion shipped to Carson Mint, assay value, \$13,319.40.

OPHIR.—1465 level—The north drift started from the drift run west from the winze 122 feet below the sill floor of the 1300 level, 80 feet west from the winze, has been advanced 30 feet; total length, 93 feet, in a porphyry and quartz formation, which yields a low assay value. Have continued the work of repairing and retimbering the main south drift on this level.

MEXICAN.—On the 1465 level the crosscut running east from the bottom of the winze, sunk 101 feet down from the end of the crosscut run west 132 feet in from the main north lateral drift near the south boundary line of the mine, has been advanced 21 feet; total length, 100 feet, the face being in a porphyry formation carrying slips of clay.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 18 feet; total distance west from the shaft, 1700 feet, the face being in hard porphyry. The Union Con. south lateral drift from the joint west drift, at a point 1570 feet west from the shaft, has been extended during the week 20 feet; total length, 186 feet. The face is in porphyry and clay.

ANDES.—North drift from east crosscut No. 4, on 420 level, was advanced 16 feet, and connected with west crosscut. West crosscut from north drift from east crosscut No. 4 was extended 16 feet; formation, quartz. Work has been resumed in the face of east crosscut No. 4 and advanced 12 feet; face in quartz giving low assays.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 520 feet; face in quartz and gypsum giving low assays.

EXCELSIOR.—East crosscut, 150 feet south of north line, 600 level, is out 295 feet; face in porphyry.

ALPHA.—North drift from the winze, 20 feet north of shaft, is out 179 feet; face in quartz yielding low assays. The southwest drift from the Ward shaft, 1800 level, is out 1157 feet; face in clay and porphyry.

NEW YORK.—The west drift from the shaft, 650 level, is out 435 feet; face in porphyry. The raise from No. 4 west crosscut, 650 level, is up 33 feet; top in quartz showing bunches of good ore.

POTOSI.—The Potosi and Bullion joint crosscut, 1500 level, was advanced 24 feet; total length, 112 feet; face in hard porphyry. The Potosi and Bullion joint crosscut, 1400 level, was advanced 24 feet; total length, 205 feet; face in soft porphyry.

CHOLLAR.—Are retimbering north drift from shaft, 650 level. East crosscut, 74 feet south of north line, 1500 level, is out 193 feet; face in porphyry. East crosscut 50 feet south of joint west crosscut, 1640 level, is out 44 feet; face in soft porphyry.

BULLION.—The east crosscut on the north, 1400 level, is out 205 feet; face in soft porphyry. The east crosscut, 100 feet south of north line, 1400 level, is out 80 feet; face in porphyry. The joint east crosscut, 1500 level, is out 112 feet; face in porphyry. The east crosscut, 120 feet south of the north line, 1500 level, is out 103 feet; face in porphyry. The south drift, 1500 level, is out 240 feet, south of the north line face in porphyry. The southwest drift from the Ward shaft, 1800 level, is out 1157 feet; face in clay and porphyry.

WARD COMBINATION SHAFT.—The southwest drift, 1800 level, is out from the shaft 1157 feet; face in porphyry.

SIERRA NEVADA.—The north drift from the Kenosha tunnel was advanced 35 feet through a porphyry formation; total distance of 647 feet. The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft 1700 feet; face in hard porphyry.

UTAH.—The west drift from the shaft station has been extended 62 feet; total length, 77 feet; face in porphyry showing some clay.

BEST & BELCHER.—900 level—West crosscut No. 1, 100 feet north from top of upraise from 1000 level, has been advanced 16 feet through soft porphyry; total length, 102 feet.

GOULD & CURRY.—200 level—Northwest drift, started 435 feet west of shaft, has been extended 25 feet; total length, 45 feet; face in porphyry. From upraise No. 2, 65 feet above this level, have started a south drift and extended same 20 feet; face in quartz. 400 level—At a point in west crosscut No. 1, 140 feet from south drift, started a northwest drift on a body of quartz, west of the old stopes, the same giving low assays, and advanced it 12 feet. Have discontinued all work on the 350 foot level. On the Suro tunnel level the joint north drift with the Savage Co. was advanced 17 feet; total length, 190 feet; face in porphyry.

OCCIDENTAL.—From the west crosscut in the south drift, 350 level, have started a winze in fair grade ore. The winze from north drift, 350 level, is down 55 feet below the 450 level; bottom in quartz and porphyry. No. 2 winze, 650 level, is down to the level of the 750, and work at that point has been stopped until connection can be made with the main north drift on 750 level. The north drift, 750 level, has been extended 15 feet; total, 283 feet; face in quartz and porphyry. The south drift, 750 level, is in 366 feet; face in low grade quartz. The drift from the Suro tunnel has been extended 30 feet; total length, 382 feet.

Ferguson District.

A DISTRICT FORMED.—Cor. Pioche Record, Feb. 27: In the summer of 1889 two young men, John E. Ferguson and Joseph Sharp, started from Hiko on a prospecting tour, and

soon after leaving home they discovered that they had neglected to take with them anything to break rocks with, consequently they kept an eye open for something to supply the place of a hammer. The first and only thing that was discovered was the main part of a monkey wrench, with all attachments long since departed, and with this they proceeded on their trip, and going into the mountains in the Bennett Springs range, on the east side of the Dry Lake valley, about 15 miles south of where the road from Pioche to Hiko enters the valley, they discovered some very rich float, with nothing but the old monkey wrench to prospect with. Hence the name given to their discovery was the Monkey Wrench mine. In the summer of '91 the Fergusons bought out Sharp and proceeded to develop their new discovery, and were crowned with the unexpected success of assays running as high as 1716 ounces. They then formed a copartnership with a Mr. H. A. Cohn, of Morey, who is a gentleman of means and enthusiastic on the question of mines, who came to see for himself and was much elated with what he saw, and suggested a vigorous prospecting of the mine. About the first day of 1892, the Ferguson brothers and J. J. Manning, Mr. A. W. Geer and W. A. Wilson began the work of development. Others began to arrive soon after and some other strikes were made, among which stands high up one opened by Messrs. Cassidy, John Roeder and J. Conaway, which bids fair to be of vast wealth, being rich in horn silver. The eastern end of the Monkey Wrench has been sunk about 10 feet and is considered a wonder, being composed largely of chloride ore. Parties of prospectors have traced the same formation and lodes from six to ten miles and brought back ore that cannot be distinguished from the richest croppings of the first discovery. On the 20th inst. the miners met at the camp of the Ferguson brothers and J. J. Manning, and organized by calling Mr. Joseph Conaway to the chair and Samuel Reed as Secretary. The question of a name for the new and rich district was discussed, and on motion of Mr. W. R. McFadden the name was declared to be Ferguson, in honor of the discoverer. The boundary lines of the district were claimed to extend from Cliff Springs on the north to Riggs Springs on the south, and from Meadow valley on the east to Ely or Dry Lake valley on the west. On motion of J. J. Manning, assessments should be worked at the rate of four dollars per day. The meeting then adjourned, with three rousing cheers for Mr. John E. Ferguson, because he was the discoverer of the wonderfully rich mining district.

Jack Rabbit District.

LAIN OFF.—Pioche Record, Feb. 27: Twenty men were laid off here Tuesday by order of superintendent, which instructed Mr. Hazelgrove to reduce his force to 15. The boys all had money galore and most of them departed next day for Utah and Colorado. The few that remain are in doubt as whether to take the desert afoot or to try and "stick it out" and trust to a resumption of work at an early date.

Pioche District.

GIVEN THREE TIME.—Pioche Record, Feb. 27: Quite a number of hands at the works were given their time yesterday, and as soon as the furnace, now running, stops, the balance of the employees will follow suit. A number of the hands relieved at the works have resolved to remain here until work is fairly resumed again. They say Pioche is good enough for them, and though times are dull, the probability is they would not better themselves by going elsewhere.

Tuscarora District.

NAVAJO.—Times-Review, Feb. 27: South intermediate below the 350-foot level extended 5 feet. A drift has been started south on a small seam of ore showing in the old 350 working. West intermediate below the 300 extended six feet.

BELL ISLE.—The crosscut from No. 1 vein, 350-foot level, extended 7 feet, cutting some low grade ore. North intermediate below the 350-foot level extended 17 feet, showing some good ore. The crosscut from No. 1 raise extended 20 feet.

NORTH BELLE ISLE.—East crosscut, 400-foot level, No. 3 drift, extended two feet in very hard rock. North intermediate drift above the south 500-foot level extended 19 feet, showing a good vein of rich ore. North intermediate, No. 2 vein, extended 7 feet and connected with the north section of No. 1 vein. No. 4 north drift, south 500-foot level, extended 8 feet and a crosscut run east therefrom 14 feet.

NEVADA QUEEN.—Second Level—No. 1 south drift extended 23 feet, and started to put up No. 3 raise, which will be about 25 feet to foot-wall side of the vein. South intermediate drift advanced 32 feet. Fourth Level—West crosscut raise extended 22 feet in low-grade ore; average assays, \$982 per ton; will make connection with south intermediate drift this week.

NORTH COMMONWEALTH.—Second Level—East drift from winze advanced 19 feet, and produced 12 cars of ore; assay, \$15 per ton; will reach 90-foot drift this week, about 45 feet farther to run. No. 1 raise, from north intermediate, up 29 feet.

DEL MONTE.—Second Level—Joint raise stope produced 8 tons first-class ore, assay \$265 per ton, and 14 cars second-class, \$41 per ton. West drift from North Commonwealth line advanced 31 feet in vein formation. West intermediate drift from joint raise stope advanced 15 feet, exposing small seam of good ore. No. 3 raise from west end of stopes put up 31 feet. Third Level—No. 1 north drift extended 17 feet; cut several small seams giving low assays.

COLORADO.

THE SMELTERS.—Denver Times, February 26: Smelting men predict a larger production this year than last. Their statements are based upon a conservative estimate. This means a larger output from the mines of this State,

which can well be believed when the many new discoveries are recalled. The Denver smelters have been receiving Creede's product since the camp has been shipping, their share of it at least, for Pueblo and nearer points have their percentage. The class of the ore is a silver, running in grade from 60 to 80 ounces. The smelter production will be much larger than last year. The actual amount of the silver output would be much greater, but it was difficult to predict the product because of the political significance which the white metal now holds. Should it remain at a decent figure, the production would be heavy. If it dropped to 75 cents many of the good producers would be "knocked." The bulk of the ore received by Denver smelters is from Leadville. The quantity from Aspen is not so large as formerly received. The value of the ores from these two great camps does not differ materially, the general run being from 30 to 100 ounces of silver. The class of ore does not change. The Boston and Colorado receives the bulk of its Leadville ore from the Henriette and Maid of Erin. They are principally copper producers. The old camps seem to be steadily holding their own, while the new ones give promise of better things. All of the plants here have made great improvements in their works during the past year, particularly the Omaha & Grant and Boston & Colorado. The Boston & Colorado expended from \$60,000 to \$70,000 last year, and, according to Mr. Pierce, the manager, will expend as much again this summer. The smelting men are loth to talk on the smoke nuisance. The Boston & Colorado and Globe claim that their smoke does not enter the city but the adverse winds carry it the other way. This would leave the Omaha & Grant to shoulder the responsibility, but their 350-foot smokestack will remedy the difficulty.

DAKOTA.

THE MINING FEVER.—Deadwood Pioneer, Feb. 26: Interest in mining properties in this section promises to be greater this year than ever before. Travelers from the mining districts entertain their friends with many fascinating word pictures of mineral wealth, both present and prospective. In the hotels, the air is laden with discourses on gold and silver, coal and galena, tin, lead and copper. Occasionally a railroad projector may be seen devising, figuring upon and, sometimes, concluding his plans for running his rails into these attractive regions of mining industry. The eastern visitors have aroused a veritable boom in mining properties, and they talk on hematite or free-milling and refractory and other classes of ores with all the fluency of a Pennsylvania expert. The most active movements toward securing properties bearing precious metal seem to have now just fairly begun. So far as can be gleaned from the most reliable authorities, the Black Hills are likely to have the greatest and most satisfactory results from the development of valuable mining districts that have heretofore, practically, lain dormant, and also from the opening of new districts. Some of our districts have awaited the advent of railroad extensions, which now promise to soon provide desirable facilities for easily marketing their valuable ores. Among the mining camps of this class, the most absorbing interest is centered upon the famous Beld Mountain district, of which Deadwood is the distributing point.

A VERY BRIGHT OUTLOOK.—Deadwood Pioneer, Feb. 27: The expectations of those familiar with the ground at Bald Mountain, Ruby Basin, Carbonate and many other of the promising mining districts of the Hills, is that when the snows disappear and prospectors are enabled to work intelligently, some wonderful revelations will be made. None of the ground in these districts has ever undergone a systematic and thorough prospecting, owing doubtless to the large outlay of money necessary to such work, but now hundreds of men, backed by ample Eastern capital, who see that the Black Hills is the place for the safe investment of their money and a guarantee of quick and manifold returns, are awaiting the time when they can begin systematic explorations of these sections. If we are favored with an early spring, which now seems probable, work will be pushed with unprecedented force, and upon the results achieved will be measured the prosperity and progress of this section of the Hills for the next ten years. The Pioneer predicts a very large increase of population, and with it a renewal of growth of all the principal towns of this section.

IDAHO.

WOON RIVER OUTLOOK.—Times, Feb. 26: Never for several years past has there been as much ore exposed in the mines of this region, nor have they generally been so full of promise as at the present time. This satisfactory condition of affairs is not confined to any one vicinity, as all the camps or districts report notable improvement. The Minnie Moore and Relief sale, which is as good as consummated, will revive Broadford wonderfully, as the change of ownership must result in the ultimate employment of 200 to 400 men at these mines alone. The Queen of the Hills Co., whose property adjoins, and which would have to bear unassisted the expense of pumping for many claims if it worked alone, will, as soon as operations are resumed at the Minnie Moore-Relief group, doubtless resume also. With work resumed in the two groups just mentioned, it will not be long before the Lee's gulch and Colorado gulch claims will be worked again. In Star gulch, the two principal groups there will undoubtedly employ a few men each right along. The Captain Jack, which is owned by the Laclede Co., will be worked from early spring, and the Star has been worked all winter by leasers on a long lease. Going up Crox gulch, the School-boy and Cressus groups are the first encountered

which are likely to be operated this summer. At Bullion, the Jey Gould leasers are doing well, and expect to do better. Other leasers on other groups are also doing well. At the Red Elephant group, a splendid record is being made, the mines showing more and richer ore than ever in the history of these claims. It will, therefore, undoubtedly resume the payment of dividends this summer. The Gold Belt claim owners are evidently all awaiting a change at the Camas No. 2. The owners of this property have recently paid off all judgments (but one) against this property, which aggregated many thousands of dollars, and are understood to be in daily expectancy of selling. Further on, the Buttercup Co. is developing a fine property. In Smoky, Sherry's group will pay this year, as it was sufficiently developed and tested last year to demonstrate this; Newt. Revis's and the Minneapolis Co.'s placers will be exploited to a profit; the Galore-Stormy leasers have good remuneration for their work "in sight;" the King of the West Co. is ready to make regular shipments as soon as the roads admit of this; the leasers on the Carrie Leonard group have an abundance of ore; and the Sunday and other claims show much rich ore. Deer Creek will be the banner camp for the next two years at least, even should no new developments be made there. The Abbey owners have a tempting offer to sell. The War Dance is a big property. The Standard Co.'s property (the May Aug) is leased until the 1st of May. Across the creek, the Nettie shows a gr at deal of ore. The Argent and other subdivisions of the French Boys' claims show genuine bonanzas. As to the Red Cloud, it promises to prove the mine of this region, and, even at present prices for silver and lead, is said to show enough ore to pay monthly dividends for six years. On the east fork of Wood river, the North Star group maintains its excellent record of the past four or five years, and still gives employment to a large number of men. The Arctic and Antarctic and several other groups each give employment to a few men; and the Triumph, which has shown considerable ore for years, will surely be put in the dividend-paying list this summer. In Elkhorn gulch, the Quaker City and other claims show pay ore, which will be extracted as soon as hauling can be resumed. The Baltimore & Victoria group is about to be sold to an Eastern company, which will work it for all it is worth. On Boulder creek, there are at least two strong companies that will ship ore regularly during the season. On Warm Springs creek, on Lake creek and in and around Galena are many claims that show much ore. Over the range, Red Wing or Vienna will doubtless have a genuine boom. The Vienna Co.'s mill will be started, and quite a force of miners, millmen, teamsters and others will be employed. In Beaver gulch, the Silver King will employ quite a force of men, and several other claims will give employment to a few each. The upper country—Bayhorse, Clayton, Challis, etc.—promises to boom this summer. Many of the properties mentioned will be operated, no matter what fate is meted to the silver bill now before Congress. But there is no doubt that, if that bill becomes a law, all will be operated, and that work will be resumed on many more which are now idle. In fact, should the bill pass, Wood River and vicinity would enjoy a genuine mining boom.

DE LAMAR.—Nugget, Feb. 27: The Delamar Mining Co. has, with its usual regularity, paid its third dividend. Work at the mine is progressing in the usual manner, and the mill never stops. Everything in and about this company's property goes on so smoothly and regularly that there is comparatively little to report. The Nugget will endeavor to give all the reports and items obtainable, and desires any reliable information in regard to the numerous properties and prospects of the county. Items of interest will be gladly received and published. Let me know what you are doing and the paper will help you. We are in a mining country and let us pull together.

MONTANA.

THE WEEK IN BUTTE.—Inter-Mountain, Feb. 27: Silver still hovers about the 90-cent mark, and the mining situation has not changed for the better since a week ago. The mining camps of the west, where silver is the staple production, are all in the same boat, and the outlook, at the best, is not very flattering. Fortunately for her business interests, Butte is not entirely dependent upon her silver mines, and if every one of the silver producers should shut down, Butte would still be the greatest and busiest mining camp on earth. Her great copper mines give employment to thousands of men, and their capacity for furnishing employment to labor is increasing every day. About the copper mines and smelters all is a scene of bustling activity, and several of the larger companies are making preparations to greatly increase their output. The force of miners at the Mountain View was increased during the week, and pending the construction of the spur, the ore will be delivered to the Montana Central tracks in wagons.

SILVER BAR SHIPMENTS.—The silver bullion shipments from Butte for the week ending last night were as follows:

	No. Bars.	Estimated Value.
Butte & Boston	10	\$15,936
Blue Bird	9	14,892
Lexington	11	24,160

NEW MEXICO.

CENTRAL.—Silver City Enterprise, Feb. 26: Geo. T. Reed, who is a party in interest in the new gold strike at Central, brought in 14 sacks of rich ore Saturday. Wherever broken the rock showed gold plentifully, and as the ore

promises to be continuous, all hands are highly elated. The strike has been the means of starting up claims which otherwise would have remained idle.

SILVER CHORD.—Recent exposures in the Silver Chord mine, the property of Allen & Spaulding, of Pinos Altos, show an average value, as per assay, of \$325 per ton in silver, at 90 cents per ounce. As depth is gained, the vein is becoming better defined, and it is by no means improbable that the next ten feet will develop ore rich in silver, the occurrence of which may possibly indicate a new era in the development of Grant county. A. S. McDonald has in his possession a nugget recently picked up in San Domingo gulch, near Pinos Altos. The specimen weighs four ounces, and with the exception of a few pennyweights of quartz adhering, is a solid mass of gold. Mc estimates the nugget to be worth \$70, and has no desire to dispose of it at that figure. San Domingo gulch has a record as a producer, but as water is scarce, but little placer mining has been done. With abundance of water, there is no question that the gulch could be made to yield bountifully. Whoever is fortunate enough to discover the ledge from which the gold comes, will have a bonanza bigger than any Creede or Cripple Creek can furnish.

OREGON.

WILL SOON START UP.—Bedrock Democrat, Feb. 27: The Washington Gulch Placer Mining Co., of which Mr. Fred Pfau of this city is manager, is preparing to start operations at an early day. Mr. Wm. Deemer, one of the heaviest stockholders of the company, arrived from Portland yesterday to look over the situation. The property owned by this company is the old Chas. St. Louis gravel mines on Washington gulch, west of the city about five miles. Last fall, ditches were dug and reservoirs constructed, and there will be nothing to prevent the starting up of operations just as soon as the spring flow of water commences.

UTAH.

A STEIKE.—Park City Record, Feb. 27: It was told on the streets yesterday morning that the Mears heft had cut the Daly vein at a depth of something over 500 feet and that about 18 inches of first-class ore was the result. The news did not partake of the nature of a rumor, but was told for an actual fact. However, an inquiry at the mine was met with a flat denial of the news, Mr. Morgan saying that there was absolutely nothing in the assertion—that if there was he would certainly know something about it. There was no more ore in the Mears shaft than had been there for several weeks. The shaft, he said, was in favorable looking ground, but the Daly vein had not been cut up to date.

A NEW MINING COMPANY.—The Record was informed this week by a Salt Lake man that it was rumored on the streets of that city that a new and big corporation had recently been formed for the purpose of carrying on mining in Park City, and that it would be known as the Hearst Mining Company and would absorb both the Daly West and Mears groups. The rumor is, of course, denied by those who should know, but from the location of the two groups and their well known value, such a move would be a strong one on the part of a strong company, for the ground is going to develop into one of the richest producing sections of this wonderfully rich district.

CRESCENT.—The work of overhauling the Crescent concentrator and putting it in shape for the coming season will commence about the first of March, so the Record has been informed by Mr. Ed. Stringer, who has had charge of the mill for several years. The indications are that the present will be about the liveliest season the Crescent has seen for a number of years. Manager Burton was down from the Lucky Bill yesterday and reports matters as moving quite briskly, notwithstanding a scarcity of timbers. The vein encountered is being drifted on, and he expects to cut the chimney of ore exposed in the old shaft in about 60 days.

WASHINGTON.

PREPARING FOR INCREASED PRODUCTION.—Okanogan Outlook, Feb. 27: S. H. Black representing the Everett gold mining and milling company at Loomiston, stopped in Conconully Wednesday on his return from Coulee City, where he was sent to make arrangements for shipping the machinery with which it is intended to increase the capacity of the War Eagle and Black Bear mill. He says the company expect to have the additional five stamps in place and ready for operation by the 15th of March, and that about the first of May ten stamps more will be added, giving the mill a capacity of 40 tons per day. The company is now working 50 men and the number will be greatly increased as the work progresses.

THE REN JACKET.—Redmond & Hendrick finished their contract of sinking 26 feet on the Red Jacket and came to town the first of the week. They immediately took another contract of 25 feet and returned to the mine Thursday. This is one of the gold claims recently bonded to H. D. Andrews and Jas. F. Wardner, of Fairhaven, for \$20,000. Mr. Andrews has been here for some time looking after the property, and is well satisfied with the work so far accomplished. He proposes to sink 100 feet on the vein, and then prospect the ore chute by drifting from that level. As soon as the 50-foot point is reached, if the showing is considered sufficient to justify it, a five-stamp mill will be erected near the claims, to treat the ore as fast as it is taken from the mines. The ledge was two feet wide at the surface and gradually increases with depth.

MECHANICAL PROGRESS.

Iron and Steel in Building.

The propriety and even necessity of a large use of iron in buildings, so as to attain the nearest possible approach to fireproof structures, is a matter now almost universally conceded. Yet the disastrous fires, which occur too frequently, even in the better class of our city buildings, in which iron is more or less used, point out clearly that there is something still lacking in this direction. Either iron is not so largely used in any given structure as it should be, or it is not judiciously constructed and placed.

The *American Manufacturer*, speaking in this connection, says: "The use of iron and steel must not stop with the putting in of a few girders and columns where strength with a minimum of weight and bulk is a desideratum. The futility of this as a safeguard against destruction of a building by fire has been exemplified again and again in every city in the country. It does not even provide 'slow burning' construction. A building may be as strong as iron will make it, but if that iron is only disposed in the form of columns and girders, fire will go through it as quickly as though there was not a piece of iron in it larger than a nail.

As yet the uses of iron and steel have not become general in construction, have been mainly confined even in the better buildings to girders, columns and floor beams, leaving to be built of wood all interior details. About the only lighter form of building material in which iron in any marked degree has supplanted the use of wood is in the various forms of metallic lathing, and these have shown their superiority from both technical and economical standpoints so well as not to need any further comment here.

The state of things noted above has not been entirely the fault of oversight of architects, either. Manufacturers have provided in abundance beams and all the heavier structural shapes, but what may be termed the artistic treatment of iron has been practically neglected, and architects have been forced to use wood for interior work from the very lack of other suitable material. Taking these facts into consideration, we would urge upon manufacturers that more attention be turned to the production of material suitable for architectural details.

The solution of the problem calls for the exercise of both artistic and mechanical ability of no mean order, but we believe it is within the reach of American artisans, if effort is intelligently turned in that direction; and that such efforts would receive the co-operation of our best architects, and be reciprocated by them, we are confident. The difficulties to be encountered from a mechanical, commercial, and we may add from an æsthetic standpoint, are no greater than have been met and overcome again and again by engineers, and the benefit to be derived both by the promoters of such improvements and the users, are far more certain than those which many other things, once innovations but now virtual necessities, have had to contend with."

In the exceptionally large buildings now in process of construction or lately built in this city, the conditions alluded to by our contemporary appear to be quite fully considered, and there can be but little doubt that such buildings are as thoroughly fire-proof as money and skill can make them. That class of buildings is not generally used as warehouses where thousands of tons of combustible merchandise are constantly stored. With such storage no human ingenuity can render a building safe from destruction by fire. Neither can any possible human structure be rendered safe in such mammoth conflagrations as in years past have visited Boston and Chicago. In such cases the heat is so great that nothing of either brick, stone or iron can stand before it. In such a heat the very walls of our most refractory furnaces would crumble into sand, or become volatilized and pass off as the vapors of combustion. The rubbish left upon the ground after the great fires in the two cities above named, represented but a mere fraction of the "fire-proof" material which entered into the construction of the buildings destroyed. The intense heat from those fires had literally "eaten up" brick, stone and iron as though they had been but shavings.

INCREASED DEMAND FOR COPPER.—The rapidly increasing demand for copper wire for long-distance telephones and for transmission of power is calling for large amounts of copper. Long-distance telephones require, in all cases, return wires. The Bell Telephone Company has now in course of construction some fifty different lines of long-distance telephones, each of which requires two lines of wires—equivalent to 100 lines of

single wires. The distance from New York to Chicago, which is the longest distance now in course of construction, is 980 miles. The wires connecting these two points will consequently be 1960 miles. The size of such wire calls for 174 pounds to the mile, or a total for that line alone of 170 tons.

Competition in Mechanical Work.

Competition in mechanical work has done much to improve and develop new and progressive features in machinery of every description. The shop, the factory, the mill, the farm, etc., have all been greatly benefited by the efforts of any given shop to turn out a better class of work than its neighbor. Of course improvements in machinery are chiefly due to inventors, but the men who put the inventor's ideas into practical shape are also entitled to a good share of credit for the skill and judgment employed in executing the mechanical work, no matter how complete the drawings may be from which such work is done. Probably there is no manufacturing center where these facts have been more fully shown than in this city of San Francisco. We have numerous wide-awake, energetic machine and mill builders in this city between whom there has ever been a generous, healthy competition.

Quartz-milling was exceedingly crude at the time that business was first entered upon in California, and more progress has been made in the science and methods of reducing ores during the 35 years of its progress in this State than in all the preceding years of its history from the very beginning of mining. Inventors, of course, have been the chief factors in our success, but the rivalry between our shops has also been an important factor. Milling engineers, inventors and mill builders have been constantly on the alert to detect any little error in construction that may have been made by another. Frequent visits are made by them to all parts of the mining regions to see how the different mills work and stand the wear of the heavy duty that is put upon them. These results of observation are never without profit to all the parties interested, and especially are they of importance to the general progress of the mining industry, which has been the foundation and has contributed so largely to the building up of the great industrial and political empire which has so suddenly made its appearance on the Pacific Coast.

It is thus that competition has worked wonders for all our great industrial interests. The competition to which we allude is altogether a healthy and useful one. It is not a competition which cuts down prices, or in any way creates business antagonism, but it is one which makes people thoughtful, fills them with useful energy—one which leads directly and only to improvement and progress. In no way is progress more readily brought about than by the thoughtfulness and energy born of a generous competition. The art of machine construction, and indeed all industrial art, like scientific knowledge, grows and makes progress only as new thoughts and new facts are brought to light and the latter demonstrated to be facts.

A NEW PROCESS OF COPPER SMELTING. Patents have been issued to T. D. Nicholls and C. James, both of Swansea, and the Cape Copper Company, Limited, London, for an improved process of treating copper ores. The extraction of copper from ore and other compounds containing the same is accomplished, according to these inventors, by this improved process, whereby a good quality of copper is obtained at a reduced cost and in less time than by the ordinary processes. According to this method the inventors proceed in the ordinary way until a regulus or like product is obtained, containing from 65 to 80 per cent of copper, and such a quantity of iron as it may be deemed expedient to retain for the proper "slagging off" of the nonvolatile impurities. This regulus, having been crushed, is calcined until as much sulphur as is desirable has been driven off. The calcined regulus is then mixed with a suitable proportion of crushed but uncalcined regulus, such as previously referred to, or with other regulus of like description, the quantities of calcined and uncalcined regulus being in such ratio that the oxygen contained in the calcined portion will combine with all the sulphur in the uncalcined portion. A charge of this mixture, with the addition of any suitable flux, is then placed in a refining furnace and melted. The volatile impurities, whether left in the calcined portion of the charge or present in the uncalcined portion, are volatilized by the intense heat generated, and are carried away with the discharge of sulphurous gas which ensues. The copper is finally skimmed, brought to pitch and "ladled" or run into ingots or cakes as desired.

SCIENTIFIC PROGRESS.

The Phonograph and Musical Sounds.

Many years ago there was exhibited in Europe an apparatus known as Faber's Talking Machine, which was a most complex piece of mechanism, imitating as nearly as possible the organs of the human voice. It had a complicated key-board, capable of various adjustments, and a bellows representing the lungs. As might be expected, the speech produced by this machine was very imperfect, and but faintly resembled the human voice. It is now of interest only as a mechanical curiosity.

When the phonograph was invented it was naturally compared with the existing talking machine, and the wonderful simplicity of the former was strongly brought out by the contrast. The comparison was unfair, however, for Faber's machine was an attempt to originate speech, while the phonograph only reproduces speech, which is quite a different matter.

The phonograph, and by that is meant the machine under its various forms and names, has, up to the present, served as a valuable apparatus for the analysis of sound, but it doesn't seem to have occurred to any one that in the synthesis or putting together of sounds it is capable of producing supremely wonderful results.

The vibratory nature of sound is well known to students of physics, and it is a matter of common knowledge that the pitch of a musical note depends upon the number of vibrations per second which produce it; but it is not so well known what constitutes the difference between the tone of a violin and of a flute, both sounding a note of the same pitch, that is, having the same number of fundamental vibrations per second.

This difference is explained by the fact that the violin string not only vibrates as a whole, producing its fundamental note, but also in its different parts, producing a number of very rapid vibrations which blend with the fundamental and impart to its peculiar quality of timbre. These extra vibrations are called overtones or harmonics, and it is their presence in a different degree which distinguishes the sound of the flute from that of the violin, or which makes a voice loving, persuasive and sympathetic, or hard, rasping and disagreeable. Were it not for the harmonics, music would be insipid and unpleasant. A tuning fork produces such a tone. It is quite free from harmonics and has pitch only, being noticeably devoid of quality. By means of a number of tuning forks, however, so vibrated as to produce the overtones in proper relation to the fundamental, almost any musical instrument may be imitated. This is the synthesis of sound. A phonographic record of a pure tone would be a sinusoidal curve, but a tone having quality would show the overtones indented upon the sinusoidal curve, producing the ragged lines seen in the pictures so commonly used to illustrate this point in works on acoustics.

In the ordinary usage of the phonograph, or the gramophone, which is better for this illustration, as its record is in the form of curves on a flat disc, the record is made by the voice, but if by any other means the sound curves could be enlarged upon the disc, the machine would reproduce the sounds just as faithfully.

Thus, if all of the tuning forks in the world were destroyed, never to be used again, Emile Berliner, by etching a sinusoidal curve upon his gramophone disc, could, in less than a week, restore to the world its concert pitch.

It would be quite within his powers to cause to be engraved upon the disc a series of curves which would reproduce any simple tune as though it were played upon tuning forks, that is, giving differences of pitch only. Having thus produced the skeleton tune, it would only require an extended series of observations of the timbre curves of the cornet, for example, to impart to the record the quality of that instrument.

If this can be done with the cornet, it would, of course, be possible with any other instrument or combination of instruments. It would even be possible to produce the tones of the human voice itself in this way. The character curves of any given voice being determined, it would be possible to cause the machine to utter the lines of any speech or the melody of any song in the tones of that voice.

If all of the musical instruments in existence should be eternally wiped out, and all men should suddenly be struck dumb, modern science, with the phonograph, could supply the world with music, and mankind with speech and song.

Although the theoretical possibility of such a result is beyond dispute, yet the practical difficulties in the way of such a prodigious

accomplishment are almost appalling. While the existence of all but insuperable obstacles must be admitted, it should be borne in mind that they are mainly mechanical, and that the resources of science are infinite. The first step toward any scientific attainment is to show its theoretical possibility. In this case this has now been done, and hundreds of plans of practical procedure are looming up to mind.

More manual dexterity will not form a necessary part of the musical science of the future. A symphony will some day be expressed in mathematical formulae, but science can never furnish the soul for music or invade the domain of creative intellect.—*Electrical Review.*

EDISON'S SOLAR TELEPHONE.—Our readers will recollect that we some time since described a process or device by which Mr. Edison hoped to be able to receive, through a peculiarly constructed telephone, sounds from the sun, when that luminary should be in one of its periodical spasms of commotion, as it now is, as revealed to the eye by the unusual size and number of spots on its disk. Mr. Edison, it will be recollected, had placed a large number of poles around a small mountain of iron ore, and arranged upon them a circuit of the most perfect and sensitive copper wire. The mountain was to be his magnet, while the wires were to conduct the sound through a proper receiver to the ear. Unfortunately for the experiment, a violent hurricane swept over that part of the country, simultaneously with the present indications of disturbances on the sun, and threw down the poles and wires. The ground was covered with snow and frozen so hard that it is impossible to erect the poles at the present time, consequently Mr. Edison has been deprived of the means of putting his plans into execution during the present most favorable opportunity; but Mr. E. is not discouraged. He will erect his poles as soon as practicable, and secure them so firmly that no ordinary blizzard can overthrow them. He continues to express the most perfect confidence in the idea. He believes that the disturbances will reach the earth on waves of electricity a little more than eight minutes after they have occurred, having traveled with the speed of light at the rate of about 190,000 miles a second. They will be changed into sound when they reach the copper wire, and may then be received by the ear or transferred to wax for subsequent use.

THE EMOTIONS.—Dr. A. Barkan recently gave the third of the series of winter lectures at the Cooper Medical College of this city, taking for his subject "Emotions, Their Physiology and Expression." Concerning the emotions of hate, fear, disdain, scorn, anger and horror, usually represented by facial expression, and in regard to their origin, influence, source and expression, Dr. Barkan said: "It has been noted in all ages that emotion possesses a natural language in expression. The medium conveying our inward feelings to our fellow-creatures—the frown of anger, the quiver of fear, the anguish of suffering, the glances of tenderness—are in complete accord with the state of feelings possessing the individual. The manner of expression, both facial and physical, is of great importance in our welfare, for not only does it give force to spoken words, but the free expression of outward signs intensifies language and lends an additional charm. The force of inanimate nature is oftentimes rendered attractive by an imaginative process. The sun, moon, wind and rivers are less engaging when viewed merely as physical agencies than when they are supposed to operate by human motives, purposes, loves and hates." In regard to the central seat of the emotions, the speaker said that interesting experiments had recently been made by Dr. Courmont of Lyons, France, in which he had ascertained beyond a reasonable doubt that the cerebrum, or brain, is a center for the registration of certain impressions, and is also the organ of various psychological manifestations. The cerebrum is also the seat of the higher mental faculties and the organ of sense, while the cerebellum, or lesser brain, is the seat of unreasoning faculties, as love, hate, joy and sorrow, or the organ of sentiment."

INSTANTANEOUS PHOTOGRAPHY.—The remarkable degree of perfection to which instantaneous photography has been brought is fully exemplified by the following paragraph: In order to photograph a flying insect, the exposure must last only 1-2500th part of a second. This the French photographer, M. Marey, claims to have accomplished by the aid of a new instrument invented by himself. He has also photographed the blood globules circulating in a vein.

ELECTRICITY.

Electrical Induction.

About one year ago, Mr. Nikola Tesla created quite a sensation in the electrical world by a lecture before the American Institute of Electrical Engineers, in New York, in which he gave a brief account of some wonderful experiments which he had recently made in relation to electrical induction. Those experiments and the explanatory lecture opened up quite a new field in electrical research, and one which promises important results, both theoretical and practical. The interest in these experiments appears to be increasing from day to day, and from the present standpoint, it is difficult to estimate the important results which may be ultimately reached in that direction.

Mr. Tesla is still persistently at work in the direction of practical results, but in a very quiet and unostentatious manner. In the issue of January 30th, mention was made of some experiments by Mr. Edison, in which the principle of telegraphing by induction was applied to the establishment of communication between ships at sea or from a ship to near-by land—say from five to fifteen miles—and, of course, without connecting wires. On board a ship, a metallic condensing surface would be placed near the head of a mast, from which a wire would extend to another condensing plate secured to some part of the hull. A similar apparatus would be placed on the adjoining land or upon a near-by ship. Communication between the two is established by induction, and messages sent and received by proper receiving and transmitting devices connected with either of the condensing apparatus upon the two ships or upon the land. This device has been patented by Edison, and is quite similar in principle to that upon which Tesla is experimenting.

WHAT TELSA'S EXPERIMENTS MAY LEAD TO.

It has been suggested by a prominent electrician, in view of Tesla's experiments, that by the use of a dynamo of sufficient capacity, an inductive current might be sent from the shore to a war vessel within attacking range, which would paralyze her crew, the induction being taken up by the armor plates of the attacking ship. Waves of induction are quite different in character from a direct current. They will pass through air, water and even solid matter, as a brick or stone wall, as readily as light through glass. Such a principle, if made thoroughly practical, would have a high value in the arts of peace as well as war. Such a current would penetrate a fog, for instance—which the most intense arc light will not to any great extent—and might be taken by the receiving apparatus of either a wooden or iron ship as it approached a dangerous coast. By the same means, as above alluded to, devices might be invented by which messages might be conveyed back and forth. Some of the bottom principles of this suggestion have already been patented by Mr. Edison and probably by Mr. Tesla also. These induction waves may also be sent through earth as well as water without connecting wires.

These experiments and the great possibilities which they portend have attracted the attention of scientists and electrical engineers on both sides of the Atlantic. Mr. Tesla, upon invitation, has crossed the Atlantic and has repeated his lecture and illustrative experiments before the English Electric Engineers at the rooms of the Royal Institution, and in the presence of many of England's most distinguished scientists and electricians, among whom were Mr. Crookes, Lord Rayleigh, Prof. J. J. Thompson, Dr. Gladstone and many others. The London Times devoted its first leading editorial column to an approving discussion of Mr. Tesla's work. So great was the interest attached to the subject that the lecture—two hours in length—was repeated the following evening for the benefit of the Royal Institution.

Mr. J. J. McCarty, one of the leading electricians of London, in an interview with a London reporter, said: "I sometimes give myself up to the imagination of what the monitor of the future may possibly be in the event of a great naval war." This remark was called forth by the suggestions which came to him after listening to Mr. Tesla's lecture.

COST OF OPERATING ELECTRIC CRANES. The following facts and figures relative to economy of working the electric cranes on wharf in London are of interest. Formerly there were on the wharf a 10-ton steel crane, a 2-ton steam crane, and two 30-cwt. hand cranes. The cost of coal for driving the two steam cranes only was \$1250 per year, steam having to be kept up night and day.

All four of these cranes were fitted with electric gear, and a dynamo with all necessary wiring, switches and safety fittings was put in, the total cost being \$1500. A gas engine used for chaff-cutting, drives the dynamo, and the cost of the gas for the whole of the work—cranes, chaff cutter and corn crusher, besides an ordinary friction hoist—is given as \$280 for the year, while the amount of the work done has been considerably in excess of any previous year. The cost of repairs and renewals for the year has been a little more than \$25.

THE NEW ELECTRIC POWER SYSTEM, called "the multiple distributing station system," has been devised and put into practical demonstration on Coney Island according to the New York Herald of Feb. 14th. Under this system there is to be no overhead wires, no storage batteries, nothing but quiet, easy motion and good speed. The Herald says: "For a good many months the American Engineering Company has been experimenting in a quiet way, and it is now believed that the new plan has reached the stage of perfection. These are some of the advantages they claim for it: No overhead wires, no conduit, no mechanism in the street, no slotted openings in the streets, no storage batteries, no inaccessible mechanism, no disturbance of the rails, stringers or ties; no danger to horses or pedestrians, and no sectional rails or contact sections. A special track, full of sharp curves, was laid near Brighton Beach, and the visitors were whisked over for an hour or more. When the experiments were over, Superintendent Martin of the Brooklyn bridge remarked: 'This is unquestionably the coming system of locomotion.' About all that there was to be seen, aside from an ordinary car, was an unobtrusive little metal plate, six by eight inches, sunk in the middle of the track, almost flush with the roadbed. These little plates are 12 feet apart. They are no obstruction to ordinary traffic and there is no slot connecting them, and no rumbling noise, as in the cable system. These plates are termed 'heads' in the electrical vernacular. The distributing system is so arranged that all of them are 'dead,' or free from electricity, except the two plates covered by the car as it runs along. A longitudinal metal brush underneath the car takes up the electricity from the 'heads' and communicates it to the motor."

THE LONG DISTANCE TELEPHONE AND INDUCTION.—The *Electrical World* records the fact that a gentleman, in Buffalo, who was recently conversing, through the long distance telephone, with a friend in Cambridge, Mass., distinctly heard the starting and stopping of the electric cars on the street in Cambridge, in front of the office of the friend with whom he was conversing. The same person who communicates the above refers to a still more remarkable circumstance, in that instance however, illustrative of electric induction. The incident occurred in Paris, when certain noises produced at the electric light station in London were heard through the telephone in Paris. The wonders of electricity appear to be so rapidly accumulating that thinking and observing men are at a loss as to where their credulity should cease. The possibility suggested by Tesla and his friends in regard to the newly discovered powers of induction, seem almost beyond human belief; but the facts coming to light from day to day lead us on from one point to another, until we are completely lost in astonishment, and don't know where to stop. The events of the last year appear to point most conclusively to the fact that we are as yet just upon the threshold of still greater triumphs than any which have yet been met with in the study of the wonderful possibilities of electricity.

ELECTRICAL TRANSMISSION OF POWER. Mr. Coleman Sellers recently read a very elaborate paper before the Franklin Institute on electrical transmission of power, in which he said: "I myself think that electricity is the most perfect and economical method of transmitting power, but people are not ready to set aside their steam engines and substitute electric motors for them at once. They will take air that will be given them in place of steam, when they find that a handful of coal will very much increase the power of that air at their works and enable air motors to be used close to the machines to be driven. Electric motors are now used to work 100-ton traveling cranes, and in comparison with square shaft-driving are considered more economical. Electricity, too, is used to drive swinging cranes and drilling machines. It lends itself to division in a manner that is wonderful in the extreme, and permits better results than anything that can be conceived of; the only doubt is that the progress of in-

vention is going on so rapidly that we are almost at a loss to know what particular line should be pursued in preference to others, and therefore, the Cataract Construction Company (at Niagara Falls) proposes to proceed tentatively.

WHAT THE WORLD IS WAITING FOR, and what Edison has promised, is an electric motor that can be operated directly by heat, without the intervention of steam. When that is accomplished, steam will be relegated to the past. That such a result will be reached, by Mr. Edison or some other inventor, can scarcely be a matter of doubt. Until then, we must be content with electricity as a secondary power, a simple carrier of energy. Even in such a capacity, it is working wonders in a hundred different directions. We have already in sight an electric motor which will prove an important advance—one which will do away with the noise and dirt of the steam locomotive on the rail; which will enable us to double the present rate of railroad speed and which will put aside the horse, the trolley, the cable and storage battery. All this Mr. Edison promises to exhibit at the Columbian Exposition. He has thus far proven a man of his word. Let us hope he will not disappoint us in this his latest promise.

A NEW ELECTRO-AMALGAMATING PROCESS has recently been given what is stated to be a successful working test at the Southern Cross Co.'s works, near the Anaconda mine. The Butte *Inter-Mountain* says the process is the invention of four Butte mining men—the Hand brothers and Messrs. Edwards and Merrill—and it was under Mr. Edwards' direct supervision that the tests were made. The process may be briefly described thus: First, dissolving the gold contained in the ore and thus getting it into solution; second, precipitating it by means of electricity into a body of quicksilver at the bottom of the pan—for it is a pan process. Quite extensive experiments have already been made upon Southern Cross ore with the process, though not upon what might be properly termed a working scale, and very satisfactory results have been shown. A roasting mill has been equipped to give the process a thoroughly practical demonstration.

ELECTRICAL HEATING IN SWITZERLAND. The Maloja Kursaal on the Engadine is being heated electrically this winter by power derived from the Mera river in Aseima. There is no doubt that considerable use will be made of electric heaters in those cases where natural power is abundant, and it is probable that this department of electrical engineering will become exceedingly important in such cases.

STOCKTON ELECTRIC ROAD.—The directors of the Stockton electric street railroad have let the contract for constructing the proposed road to the Thompson-Houston Electric Company. The contract includes all the work upon the road from the laying of the rails to the building of the cars. The road is to be in running order by the 15th of July next.

MANGANINE, A NEW ALLOY.—Manganine is the name of a new alloy, consisting of copper, nickel and manganese, which has been brought on the market, says *Iron*, by a German firm, as a material of great resisting power. The resistance of manganine is higher than that of nickeline, which has heretofore passed as the best resisting metal. Another advantage of manganine is its behavior under variations of heat, the resistance, it is claimed, being affected only in a minute degree by high temperatures. It is therefore adapted for the manufacture of measuring instruments and electrical apparatus in general, which are required to vary their resistance as little as possible under different degrees of heat. A further interesting fact is that while other metals increase their resistance by the raising of the temperature, that of manganine is diminished.

OIL FIELDS.—A dispatch from Paso Robles, dated the 18th, says: Work has been commenced on the development of the oil fields discovered on Santa Rosa creek. The indications point to most favorable results. Petroleum exists in large deposits along the creek. The discovery promises to equal any of the oil fields of Southern California.

THE USE OF OIL AS FUEL seems to be slowly but surely gaining favor everywhere, both in Europe and this country. Trials have recently been made in some of the largest power plants in New England, which have shown both economy and efficiency in the new fuel.

STEAM BOILER NOTES

DRY STEAM.—There is no diversity of opinion among engineers in regard to the comparative value of wet and dry steam. Moist steam is sluggish and its elastic force is diminished in proportion to the moisture it contains. Moisture in steam is produced from the priming of the boiler, from condensation in long conveying pipes, from bad water and from forcing boilers. There is danger in moist steam from the water which it carries over into the cylinder, especially in these days of high speed and small clearances. To remedy this defect and danger, devices have been constructed to automatically effect a mechanical separation of the water from the steam, and it has been quite fully determined that such separation can be made. This matter has become a subject of so much importance that it was taken up, in June last, at Sibley College, Cornell University, and a competitive test made with the view of determining the best method of construction, operation, etc., to accomplish the desired result. The tests were made with steam carrying from 10 to 33 per cent of moisture. What is known as the Hine eliminator headed the test list by producing an average of 98.7 per cent of dry steam.

CUSHIONING.—A few years ago it was thought to be a nice little trick to cushion the bearings with soft wood, leather, or some such substance, to prevent an engine pounding, as with the bearings cushioned it would run much slacker without pounding, and consequently with no danger of heating, but the engineers who made use of this little scheme did not really give it away, as it was not considered to be "good engineering." Lately, we understand, the practice is becoming quite common on marine engines. Of course, a slight modification of the old practice is employed, but taken altogether, it amounts to the same thing, and really enables an engine to be run much looser in all the bearings and connections. In marine engineering there is some excuse for the practice, as with cushioned bearings and looser connections there is less friction to the engine, but more particularly, the engine can be driven harder with less danger of heating; but from a high engineering standpoint the practice is not commendable. —Stationary Engineer.

DON'T TURN EXHAUST STEAM INTO SEWERS, for such practice is both destructive to the sewer and dangerous to health. Hot steam causes slow disintegration and final collapse in a brick or cement sewer or chimney. In many places, and in this city as well, it is quite a common practice of engineers to turn the exhaust from pump or small engine into the sewers. It is bad practice, and, we believe, an illegal act in some cities, for it will not only destroy the sewers, but the heat of the steam makes the malarial gases more active, while at the same time it produces a certain amount of pressure that will force the gas back into the buildings through the water traps commonly in use. In these traps there is seldom more than three inches of water, and very little pressure is necessary to force the gas through them. Wherever gas is forced back through buildings in this or a similar manner, the death rate in that locality will certainly be greatly increased.

RAPID STEAMING BOILERS.—Recent improvements in boilers, especially those of the water-tube type such as are put into high-speed gunboats, torpedo boats, etc., show considerable increase in the power developed from a given weight of boiler and water over those formerly in use. A gunboat was recently equipped and furnished with a water-tube boiler in which all of the tubes were straight, and it supplies steam for the development of from 90 to 100-horse power per ton weight of boiler, including water, as reported after the test. A clear description of the boiler was not given, but if such power can be developed from such a weight of material, it shows an extremely high evaporative efficiency.

DON'T FORCE YOUR BOILER.—One very important cause of deterioration in boilers is due to the fact of their becoming too small, as work increases, to do the work without forcing, so that the pulsations of the engine cause a well-marked succession of shocks on the boiler, which result in the weakening of the material. By placing one's hand on the head or shell of the boiler, the vibrations of the metal can be felt similar to the rising and falling of a man's chest while breathing.

VOLATILITY OF GOLD.—Four pounds of gold were recently collected from the soot of the chimney of the Royal Mint in Berlin.

Passing Events.

Caminetti's bill for permitting hydraulic mining under certain conditions has been introduced in Congress, and advices from Washington indicate very good prospects of its passage this session. If that is the case, the mines can be started up without very much delay, as it will not take very long to put in the restraining dams.

The Employers' Association of this city is making strong efforts to put a stop to labor agitations, boycotts, etc., which have done so much to the detriment of the local manufacturing interests.

The organization of a large forge and gun company, in this city this week, is a very important industrial move. They propose to make guns, plates, armor, bars, shot and forgings, and conduct all business incident to such manufacture. It is intended to make all the steel needed, here, so that steel works will be put up. Arrangements have already been made for fuel and mine.

COLORADO's exhibit at the World's Fair will be largely mineral in character, and this feature, which will be made as complete as possible, will be shown in the mining building.

A Permanent Debris Commission.

On page 174 of this number of the PRESS is given the text of Caminetti's Hydraulic Mining bill, which provides for a permanent commission of three Government engineers, to be known as the California Debris Commission. Since the bill was drawn, a clause has been inserted providing for a tax of three per cent on gross output of all hydraulic mines benefited by the improvements created by the Government. The bill has been referred to a committee.

It seems that the Miners' Committee, now in Washington, found that if the miners did not object to a tax to pay for the necessary restraining works or dams, there would be much more likelihood of getting the proper legislation this session. They accordingly telegraphed the Executive Committee of the California Miners' Association, asking if it were probable the miners would agree to the following tax: One-fifth of one per cent on quartz mines, one-half of one per cent on drift mines, and three per cent gross product on hydraulic mines.

At the meeting of the Executive Committee, after considerable discussion, they resolved to answer that they did not favor a tax of any kind on quartz or drift mines, but would favor, if necessary, a tax of three per cent on hydraulic mines. Several very large owners in gravel property gave their opinion in favor of the proposition.

Messrs. Luttrell, Hobson, Searles and Caminetti called upon Secretary of War Elkins, Monday, and talked over matters pertaining to the improvement of California rivers and the resumption of hydraulic mining. Mr. Luttrell and the Secretary are old-time friends, and the latter was very willing and anxious to hear all that the Californians had to say on the subject, although he professed to have fair knowledge of these matters himself, having given them some attention. Mr. Luttrell says that the Secretary expressed himself heart and soul in favor of Congress doing something to revive California's once flourishing industry of hydraulic mining, if it can be done without injury to the navigation of rivers and of the farm lands situated along them. They also visited Chief of Engineers Casey, and laid before him a copy of Caminetti's bill. He has made some slight changes, and is in favor of its passage.

Before leaving for home, Robert T. Devlin wrote a letter to Judge Niles Searles of the Miners' Committee with reference to the mining bill. Among other things he said: "With some slight amendments which I have prepared and which I inclose, I think the bill represents the sentiments expressed in the miners' convention, and will be acceptable to the people affected by hydraulic mining in the past. These amendments provide—First, that it shall be the duty of the United States District Attorney to enforce the law and prevent persons mining by hydraulic process, except as provided for by said commission. Second—That provision shall be made for preserving the works erected by Government that they may not fall into ruin when no longer useful for mining purpose. Third—A declaration that nothing contained in the bill shall be so construed as to change law as determined by the courts.

Miners will do well to read the full text of the bill, which is very important to California.

THE HALE AND NORCROSS trial has been concluded. The defense thought to introduce evidence in rebuttal, but concluding not to do so, submitted its case on the testimony. Mr. Baggett, for the plaintiff, desired to amend his complaint to conform with the testimony, and to allege that Hobart and Hayward are principal stockholders and not owners of the Nevada mill; that the defense may not take advantage of that point in its argument; also, to amend so as

to state the probable damage that has resulted to the stockholders from the alleged conspiracy to defraud them between 1887 and 1889, through the milling of the Hale and Norcross ore. The motion on these amendments will be argued on the 10th and the arguments on the main case on the 14th before Judge Hebbard.

Comply with the Request.

It is greatly to be hoped that the request of the California Miners' Association will be complied with by individual hydraulic miners everywhere, and that no illicit mining will be carried on. By this is meant mining where injury is done to farming lands, or rivers, or where it is not carried on with the consent of the valley people. In some places, the conditions are such that the valley people do not object, and in such cases, of course, no harm is done.

The Miners' Association is working very hard to rehabilitate the hydraulic mining industry on a legal basis. If individuals, to get a few dollars, persist in disobeying court decrees, and continue to mine, they will embarrass the Association and do great harm to the whole cause. It is much better to wait patiently until the necessary steps are taken to restrain the debris properly. There has been factional strife enough over this question, and now that there is a chance of ending it, and letting the mining go on under agreed restrictions, it seems the height of foolishness to commit any act which will endanger the whole project.

Such miners as insist on having their own way in this matter, and selfishly pursue their own course, in defiance of public opinion and the wishes of their fellow workers, deserve no sympathy whatever if brought up with a round turn. They endanger the whole business. The Miners' Association has published broadcast an official request that illegal mining be stopped. The valley people realize the earnestness of the Association in this request. It ought to be respected everywhere. The hydraulic miners must stand or fall together this time, and the one who defies opinion and request, as well as what is really proper and right, is a traitor to the cause. He ought to be put under the ban by all decent men.

The California Miners' Association.

On Monday afternoon a meeting was held of the Executive Committee of the California Miners' Association.

A long letter from delegate J. B. Hobson, from headquarters at Washington, was read and gave much satisfaction. It stated that our Senators at Washington are both in favor of legislation and appropriations to allow the resumption of hydraulic mining, and will aid in every way. Our representatives are also working very hard for the general interests of the cause. R. T. Devlin and George Ohleyer are doing good work. John Hays Hammond, M. E., has been using his best efforts with acquaintances to further the purposes of the Association with great success.

A similar letter reporting good progress from Hon. J. K. Luttrell was read.

There was considerable discussion over the proposition to tax hydraulic mines three per cent of gross product for impounding works, but it was finally decided to approve the suggestion, as the committee in Congress was strongly of the opinion that it would aid matters at Washington.

The resignation of Henry Pichoir, as treasurer, was received, and the Crocker-Woolworth bank was selected as depository of the funds of the Association.

Robert McMurray, one of the delegates, left for Washington this week to join his colleagues.

THE outlook for the free coinage bill is much better in Congress than was reported last week.

Shasta County Miners.

A very enthusiastic miners' meeting was held at Redding, Shasta county, on Tuesday, and a County Association was organized. The officers are Judge Aaron Bell, Pres.; R. G. Hart, Vice-Pres.; Wm. G. Hobson, Sec'y, and Fred Grotefend, Treas. The Executive Committee is as follows: A. B. Paul, Col. C. J. Clark, J. Scranton, James Sallee, J. H. Morton, Wm. James and W. T. St. Auburn.

The proprietors of the newspapers of the county were made honorary members of the Association.

Upon motion, the Chair appointed the following Committees on Subscription and Membership: Redding—B. Conroy, John Bamber, L. S. Barnes. Igo—R. G. Harvey. Shasta—L. Garrecht. Old Diggins—Frank Young. Whiskeytown—Horace Green. French Gulch—Walter Van Matre. Anderson—A. W. Baker. Millville—Al Dunham. Squaw Creek—W. James. Copley—A. C. Ellis. Newtown and Buckeye—S. Stickley. Western Shasta—Tim Quinn.

The dues of the Association are 50 cents a month, the initiation fee being \$1. The body is to be known as the Miners' Association of Shasta County. The objects of the Association are as follows:

1. To bring into close and friendly relations the mining men of Shasta county.
2. To promote the mining interests of the county by directing the attention of capitalists to the immense and varied resources to be found in it.
3. To accumulate and preserve all records which may be of service to those seeking information in regard to our mining resources.
4. To provide a place of meeting where members may discuss questions of practical importance.
5. To keep on file various magazines and such periodical literature and newspapers as may be of interest to the members.
6. To endeavor to obtain just legislation in regard to titles to mining claims on railroad land and on other vexed questions which may arise.
7. That a library be formed and donations of books be solicited, works of reference being sought for or purchased, and that all the United States mining reports possible be obtained, and also those of different nations.
8. Also that a cabinet be formed which shall contain a standing exhibit of Shasta county ores.

CARNERO is an old camp in Colorado which is just now attracting attention again. It is about twenty miles from Del Norte, and will soon have a railroad. The camp was located in 1882 and a large number of prospectors were attracted to that locality by an extensive outcrop of porphyry all over the country, which was quite level. It was found by the summer's work that the locality was not favorable for the poor man, and the district was abandoned, except by one man, who located a hog ranch in the vicinity and has continued since 1883 sinking a shaft. Last summer he got down 250 feet and struck a lime contact, at which point he found a blanket vein of mineral eight feet in thickness. Tests were made, and it was found to contain gold and silver to the amount of \$300 and \$400 per ton. The ranchman kept his find secret until recently, while he secured several locations, and a few days ago allowed the conditions to be known. He took a party of prospectors to his barn, where he had about 100 sacks of ore from this mine. Flakes of gold were seen in the stuff and the party went wild, and the news brought from Del Norte is that the rush has commenced for the new camp.

THE San Francisco and San Mateo railway, the pioneer electric street railroad in this city, will make the first test of running its cars next week. The power house at Sunnyside has been completed. Wet weather has interfered with the construction of the switch from the main track into the car house. Otherwise, the entire road from Stuart and Market streets clear out to Sunnyside is finished.

Dumping Mine Cars.

In the PRESS of last week were given sketches of the "gunboats" of incline cars used at the Cross Creek Collieries for taking the coal from the bottom of the mine slope to the top of the breaker. The method of dumping these when they reach the top is as follows: The "gunboat" or car is so constructed that the back wheel has a much wider tread than the front. The rails from the bottom (2) (see engraving) continue to the dump at the top of the breaker, but at a point a little to the left of C. D. a second track commences, which is formed by an angle-iron (3 and 4) arranged in such a manner that, while the front

track is built; 13, eight-foot rope sheave; 29, floor of upper part of plane.

On gunboat: 9, front wheel; 10, back wheel; 11, front axle; 12, back axle; 17, clamp over spreader-bar; 18, head of swivel-pin to connect with rope; 19, spreader-bar (I-beam); 20, front pulling-bar; 21, pin in front of pulling-bar; 22, guide-strip to prevent pin (21) from striking; 23, back pulling-bar; 24, pin connection between stirrup and back pulling-bar 23; 25, stirrup for pulling-bars; 26, guide for pulling-bars; 27, wings on mouth of gunboat; 28, back pedestal.

On dump chute: 2, sides on chute bottom; 3, cast-iron chute plates; 4, web on chute platss; 5, I-beam supporting chute

The Mechanical Engineers.

The members of the American Society of Mechanical Engineers who will visit this city in a body in May next are not merely people who can run a locomotive or stationary engine, but skilled professional men equipped to design or construct great engineering works. To be eligible as a member of this society, the candidate must have been so connected with certain professions as to be considered in the opinion of the council competent to take charge of work in his department, either as a designer or constructor, or else he must have been connected with the same as a teacher. Mechanical, civil, military, mining, metal-

to entertain the visitors at a banquet in the Guildhall. This in itself was an exceptional honor. In gracious response to an application to the Queen, Her Majesty directed that special facilities should be afforded for visits to Windsor Castle, including the private apartments, and to St. James and Buckingham Palace.

The Archbishop of Canterbury personally showed and explained the objects of interest in Lambeth Palace; while the Dean of Westminster delivered in the Abbey an address on the historical association of that building.

Among the purely social entertainments offered, were a garden party by the Baroness Burdett-Coutts, a reception by Lord Bras-

METHOD OF DUMPING MINE CARS AUTOMATICALLY.

whssl (9) can go through, the back wheel (10), with a much broader flange, is obliged to follow up this angle-iron. The result of this is, that the hind wheel (10) gradually rises, so that when the front wheel reaches the end of the track (2) the hind wheel is in the position shown in the figure, and the coal slides out itself without shock, the "gunboat" merely forming the prolongation of the dump. This is a very simple and convenient method of arranging the automatic dumping of loaded cars at mines.

By reference to the engraving, the details of the "gunboat dump" may be seen. The numbered parts are as follows: 2, rail for front wheel; 3, flat strap of iron upon which rear wheels of gunboat run; 4, flat iron strap to protect timber and act as guide; 5, second abrupt change in back wheel track; 6, abrupt change in front wheel track; 7, third abrupt change in back wheel track; 8, timber upon which the back wheel

plates; 6, angle-iron stiffener on I-beam; 7, brace for I-beam; 8, top flange of dump girders.

A DISPATCH from London says that it is now estimated that 460,000 miners will cease work in a fortnight in their efforts to prevent a reduction in wages. Should the present intentions of the miners be carried out and a strike inaugurated, this branch of the industries will be seriously affected, and it is estimated 1,000,000 men will feel the effects of the struggle. The price of coal is rapidly rising in London.

THE RIGHT SORT.—The Tidings says that every employe of the Idaho mine has joined the Nevada County Miners' Association. The employes of other mines should present a like record. To miners particularly, the present movement is fraught with interest.

Jurgical and naval engineers and architects may be candidates for membership. There are also associate members, who must have such a knowledge of or connection with applied science as qualify them to co-operate with engineers in the advancement of professional knowledge.

This society made a trip to England, France and Germany in 1889 and were very handsomely received and entertained by their professional brethren, especially in England. In London the party was formally received at the house of the Institution of Civil Engineers, by the President, Council and members when an address of welcome was presented, which was eloquently responded to by Professor Thurston—a name well-known to all engineers. On the evening of the same day the reception committee was, by the express sanction of the Lord Mayor, Alderman and Court of Common Council of the City of London, enabled

sey, K. C. B, associate member of the Institute of Civil Engineers, and a dramatic performance in the grounds of Copp'd Hall by invitation of Mr. S. B. Boulton associate member; while those members of the Civil Engineers Society who had facilities for doing so, vied with one another in their efforts to afford the visitors amusement and recreation during their six days stay in London as an organized party.

There were also visits to various engineering works and places of interest in and around London. Special trains were granted by the principal railway companies, and the entire party was escorted to Dover by a deputation of the Council of the Institution of Civil Engineers, when leaving for Paris.

It will be seen from this that wherever this society meets for its annual session it is received with distinguished honor. In San Francisco there will be no exception to this, and preparations are already being made for their entertainment. The party will leave New York on May 6th in a special Pullman train.

A Debris Bill.

The Hydraulic Mining Measure Before Congress.

A dispatch to the *Chronicle* from Washington, dated Feb. 27th, gives the following information:

The gentlemen who represent the miners and farmers of California have finally agreed upon a bill that is satisfactory to both sides, and will be introduced in the House at the first opportunity. It contains the principal features of both the Geary and Caminetti bills, but the proposition to assess the gross output of the mines, thus converting the appropriation into a mere loan from the Government, is omitted, and will not be inserted until the Miners' Association, the Executive Committee of which will meet in San Francisco on Monday, gives its assent.

The first section of the bill provides for a permanent commission, to be known as the California Debris Commission, consisting of three members. The second section describes the purposes of the Act as "First—To construct restraining and impounding dams, settling basins, relief canals and other works calculated to protect the navigable waterways and channels of the Sacramento and San Joaquin river systems from the encroachment of and damage from debris resulting from mining operations, natural erosion or other causes, and to permanently improve them. Second—To permit, on behalf of the United States, hydraulic mining on the tributaries of these rivers and the respective branches of such tributaries under the provisions of this Act; provided, that no injury or damage results to the navigable waterways and channels of the river systems."

The jurisdiction of the commission extends to mining on the tributaries of those rivers. The Secretary of War will designate three officers of the engineer corps of the army to constitute the commission within ten days after passage of the Act. The office of the commission is to be in San Francisco, and it will organize within 30 days after its appointment, when it will adopt rules of procedure for mine owners. The United States District Attorney of the northern district of California will advise the commission and institute all legal proceedings.

The duty of the commission will be to adopt plans to restore, as near as practicable and as the necessities of commerce demand, the navigability of the rivers to the condition existing in 1860. The bill also makes it the duty of the commission to determine the utility of storage sites in canyons and tributaries of the rivers or in plains, basins, sloughs, tule and swamp lands adjacent to them, for the storage of debris or water, or as settling reservoirs, with the object of using them to aid in the improvement and protection of navigable rivers by preventing the deposit therein of debris resulting from mining operations, or for affording relief thereto in flood time and providing sufficient water to maintain a scouring force in the summer season.

The commission will restrain, when appropriations therefor are made, by dams or other methods, all material lodged in the waterways and channels of the rivers and their tributaries, in order to better protect them, and will note from time to time, at the high and low stages of water, the amount of material carried in suspension, and will examine and estimate, from time to time, the amount of hydraulic mining carried on on each of the rivers, and will ascertain where the material so mined goes. In general, the commission will make a study of the hydraulic mining industry and devise methods whereby such mining may be carried on without injury to the navigable rivers. The commission will make annual reports, with plans of construction and estimates, which will, in turn, be transmitted to Congress.

The act gives a definition of hydraulic mining, and says that the owners of mining ground desiring to operate hydraulic mines shall file petitions, verified under oath, giving descriptions of the ground intended to be worked, the depth of the bank and the character of the material; the amount of earth to be moved, the quantity of water to be used, the number of monitors proposed to be employed, the character and extent of the dump, the distance from a navigable river, what facilities at the mine or elsewhere exist for impounding and restraining the debris, or settling the material carried in suspension after leaving the impounding dams or the point of discharge of the mine; what, if any, restraining impound works and settling reservoirs such owner proposes to build at his or its expense, of what material and at what place, also stating the capacity thereof. This petition shall be accompanied by plans and specifications of re-

straining and other works proposed to be built.

The owners of such mines shall surrender to the United States the right and privilege to regulate by law the manner in which the debris resulting from the working of the mines shall be disposed of. The surrender will in no way affect the right of the owners to operate the mines by any other process now in use. The use of common dumping sites is provided for.

After the petition is filed the commission will fix the date for a hearing, advertising it for ten days in San Francisco and Sacramento, and the law fixes the order of purchase in the hearings as to the introduction of testimony, contests, etc. In 30 days the commission will give a decision, which will be final, unless good cause for a rehearing is shown by the defeated party, and will then specify what works are to be constructed and how the operations shall proceed, having the protection of the owners always in view. When the works have been completed and approved by the engineers, permission to mine will be given, but first everything must be complete. In case of a joint petition for a common dumping site, the commission will decide the amount to be paid by each petitioner toward building the necessary restraining or impounding works.

In all cases where it is practicable, restraining and impounding works are to be provided by mine owners, near the mines before reaching the main tributaries of the navigable river. At no time will more debris be permitted to be washed away from any hydraulic mines than can be properly cared for at the mines or by the restraining works, or which, in the aggregate, will produce material to be carried in suspension in the rivers in excess of the carrying capacity of the current.

When necessary or advisable, the commission can modify any order granting privilege to mine by hydraulic process, and any violation of the order will be punished by forfeiture of the privilege. For the malicious destruction of any dams or other works, a penalty is provided of a fine not exceeding \$5000 or imprisonment for not less than five years, or both.

The commission can acquire by condemnation or purchase any land necessary for construction or storage, or for right of way, or to secure material, such as stone or timber. Public lands can be used by notifying the Commissioner of the Land Office, who will withdraw it from entry, and the use of ravines, water courses, storage sites, etc., is declared a public use. The commission can call on the Secretary of War or the Secretary of the Treasury, with his geodetic survey, for assistance at any time. When work is to be done, the commission will advertise for bids. If it is not done by contract, hired labor will be used. Under no circumstances will Chinese labor be tolerated.

The bill concludes by empowering the commission to proceed at once to build at available points above the head of navigation such impounding dams, settling reservoirs, canals, locks or other works as may be necessary to protect the rivers from debris already lodged in their tributaries, or which may lodge there hereafter. To do that the following appropriations are proposed: Stone dam, Rattlesnake Bar, American river, \$200,000; stone dam at Van Geisen's, Bear river, \$150,000; stone dam at Deugerec Point, Yuba river, \$300,000; dams and restraining banks on the Feather river, \$150,000; for the construction and completion at such place as the commission may deem fit of any restraining works, \$150,000; dams in the tributaries of the Sacramento, in the vicinity of Redding, \$30,000; other dams, \$40,000; stone dam on Sutter creek, above Lone City, \$20,000; dams on the Calaveras river, above Jenny Lind, \$30,000; for the use of the commission, immediately available, \$50,000.

This bill, which has just been finished by Mr. Caminetti, is thought to be the best that could be prepared, and it will probably be introduced on Monday.

Mr. Ohleyer reserves unqualified approval of the bill because he first wants to hear from his co-workers in the antidebris society.

From letters and telegrams received from the coast both Mr. Devlin and Mr. Ohleyer believe that some people there have mistaken the idea of their mission here. "We were sent here," said Mr. Devlin to-day, "by the Sacramento River Convention. This convention has had meetings in previous years, and has sent delegates to Washington to work for an appropriation for the improvement of the rivers. This is our sole errand here now. Our convention was held in December, and in January the miners held a convention in San Francisco, which we attended. At that convention a scheme was adopted by which hydra-

ulic mining could be resumed without damage to the farmers or impediment to navigation. Like good citizens, we favored this plan, as we would favor any plan that would add to our wealth and greatness without interfering with the rights of others.

"Shortly after our arrival here we appeared before the proper committee and made our arrangements and now have only to interview the individual members and try to get as much as possible in the bill to be introduced by the Rivers and Harbors Committee, which bill, I believe, is now being drawn up. A committee from the Miner's Convention followed us and we agreed to work together in harmony, that is, we will help them and they will help us. That does not mean that we have forgotten our original mission. We are here, first and last, to get an appropriation for our rivers. We are doing all we can to assist the miners' committee, but we will not tie ourselves up in any arrangement that would defeat our original object; that is, if the miners do not succeed in attaining their object we will not be so placed that we must fail, too.

"We want an appropriation and we will fight for it, no matter what Congress does with regard to hydraulic mining. Heretofore, when we have asked for money for river improvements, Congress has said: 'Why should we give you money to clear out your rivers when you immediately proceed to clog them up again?' and the appropriations have been refused. This year it is different. We can prove to them that hydraulic mining has been stopped, and, unless party policy interferes, we ought to get something; not as much as we ask for, but still something."

Assessment Notices.

KEYSTONE CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Saturday, the 30th day of January, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 310 Pine St., room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made, the same will be sold on Monday, the 28th day of March, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors.
J. E. ISHAM, Secretary.
Office, No. 310 Pine St., Room 43, San Francisco, Cal.

CALIFORNIA VERDE ANTIQUE MARBLE COMPANY.
Location of principal place of business, San Francisco, California. Location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 24 day of February, 1892, an assessment (No. 1) of One (1) cent per share, was levied upon the Capital Stock of the Corporation, payable immediately in United States Gold Coin, to the Secretary, at the office of the Company, 308 Pine Street, San Francisco, California. Any Stock upon which this assessment shall remain unpaid on the seventh (7th) day of March, 1892, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the twenty-eighth (28) day of March, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.
W. J. CURNETT, Secretary.
Office, 308 Pine Street, San Francisco, California.

DELINQUENT SALE NOTICE.

SAN FRANCISCO MILLING AND MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of works, West Point, Calaveras County, California.

Notice—There are delinquent upon the following described stock, on account of Assessment (No. 1) levied on the 12th day of January, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintances with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

MINING AND SCIENTIFIC PRESS PREMIUM.

WHO WILL BE NEXT PRESIDENT?

NEELY'S GREAT HISTORICAL CHART POLITICAL AND UNITED STATES MAP.

A Double Wall Map, 5 feet 6 inches by 3 feet 10 inches, mounted on rollers top and bottom, ready to hang.

Better than an Encyclopedia.

A Panorama of American History.

Printed in Eleven Beautiful Colors

LARGEST, LATEST AND BEST, WORTH \$10.00, GIVEN FREE.

IT TELLS

How many Presidents we have had and Politics of each. What party George Washington represented. What Presidents died while in office. How many Presidents served two terms. Which candidate received the largest number of votes and was defeated. When each political party was organized. How many Congresses have convened and the Political Complexions of each. The number of States in the United States and the one having the most miles of railroads. How many Political Parties have existed in the United States.

A Complete History of our Government by Administrations, Political Parties, and Congresses from Washington to Harrison.

On one side the latest U. S. Map, showing all States, Counties, Railroads and Towns (price alone, \$5.00) and on the other side:

A diagram showing all the Political Parties, 11x66. A diagram showing all the Presidents and Cabinets, 5x66. A diagram showing Political Complexions of each Congress. A diagram showing Creeds of the World, 13x10. A diagram showing Standing Armies of each Nation, 13x10. A diagram showing Naval Tonnage of each Nation, 13x10. A Complete Map of the World, 13x20. A Map of Central America, 10x13. A Map of Alaska, 10x13. A Map of South Africa, 10x13. A Map of Upper Nubia and Habesh or Abyssinia, 10x13. A Map of Persia, Afghanistan and Beloochistan, 10x13. A Complete Map of Solar System, best ever made, 10x13. The Names of all Cabinet Officers, with length of term. Pictures of all the Presidents, from Washington to Harrison.

ILLUSTRATION OF MAP PACKED READY FOR SHIPMENT

INDORSEMENTS.

BENSON J. LOSSING, LL. D., Historian: "Like a concave mirror, it reflects to a single focus an epitome of the essential elements of our national history, showing clearly at a glance the progress of the nation from its infancy to its present period of maturity."
PROF. G. F. WITTER, JR.: "It is concise, complete, and in the study of political history indispensable."
HON. J. C. BRANNER: "It can not fail to be of great utility to the people without regard to party or occupation."
SUPT. G. R. SHAWHAN: "I think it very fine indeed."
SUPT. A. F. CLARK: "Grandest success ever issued."

AGENTS' REPORTS.

"Received sample; sold 8 maps the first hour."
"Magnificent map; my boy sold 12 the first day."
"I sell 9 each day."
"Have 7 agents at work selling 60 a day."
"Called on 30 houses, sold 29 maps."
"Made 16 calls, sold 21 maps."
"I sell at every office, without exception."
"Received the 10 maps, sold 7 before supper."
"Sold 17 yesterday, will send order Saturday."

The **LARGEST AND LATEST U. S. MAP**, printed in colors, covers the entire back and is the best published. It alone sells for \$5.00. The complete Reversible Map (printed on both sides) is 3 feet 10 inches, by 5 feet 6 inches, mounted on rollers top and bottom, with tape on sides. These two maps sell separately for \$10.00.

This Magnificent Map will be sent (mounted on rollers, postage prepaid) to subscribers to the MINING AND SCIENTIFIC PRESS for \$1.00 in addition to the regular subscription price of the paper. The Map will not be sold to any person not a subscriber nor to any subscriber who does not stand credited upon our books with an advance payment. The premium is the best ever offered in California. Address DEWEY PUBLISHING CO., 220 Market Street, San Francisco.

35 NEW MONTGOMERY ST., SAN FRANCISCO.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

IMPROVED FORM OF HYDRAULIC GIANTS.

THE ABOVE CUT ILLUSTRATES THE IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS which we manufacture, and which are pronounced far superior to the SINGLE-JOINTED style. The latter, however, we furnish when requested. Prices, discounts and Catalogues of our specialties of Hydraulic Machinery sent upon application.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING FEB. 23, 1892.

- 469,223.—CAR COUPLING—E. Bowch, Los Angeles, Cal.
- 469,512.—PULLEY—W. F. Buswell, S. F.
- 469,543.—GANG EDGER—F. W. Cook, S. F.
- 469,549.—LEIBER AND SALES BOOK—J. E. Depue, Oakland, Cal.
- 469,550.—STONING KNIFE—F. H. Disbrow, Glendora, Cal.
- 469,551.—STREET SWEEPER—P. B. Donahoo, Fresno, Cal.
- 469,559.—AUTOMATIC FUNNEL CUT-OFF—J. H. Driller, Los Angeles, Cal.
- 469,346.—SAFETY DEVICE FOR ELEVATORS—Thos. Fuller, Angels, Cal.
- 469,566.—AMALGAMATOR—J. H. Hawthorn-thwaite, S. F.
- 469,247.—BED-COVERING—W. Holder, Mokelumne Hill, Cal.
- 469,252.—SEED CLEANER—R. W. Jessup, Alameda, Cal.
- 469,580.—WHEEL WRENCH—M. Marshall, Walla Walla, Wash.
- 469,585.—HYDRAULIC ELEVATOR—A. J. McAdam, S. F.
- 469,589.—HYDRAULIC MOTOR—J. W. Pack, S. F.
- 469,594.—INITIALER—J. A. Perou, Paris, Cal.
- 469,306.—MOTOR—John Sands, Seattle, Wash.
- 469,280.—ELECTRIC RAILWAY—W. S. Smith, Berkeley, Cal.
- 469,613.—NUT LOCK—C. O. Viuyard, Navajo Springs, A. T.
- 469,618.—PROPELLER BLADE—D. H. Welch, Astoria, Or.

The following brief list by telegraph, for March 1, will appear more complete on receipt of mail advices:

California.—Matthew Ulmeyer, Oakland, feed mechanism for nail machines and nail-rolling machinery; Matthew Arnold, San Francisco, riveting machine; William N. Best, Los Angeles, portable lawn fountain; E. Chauquette, San Francisco, machine for upsetting tires; Robert Dows, Modesto, combined wash bench and wringer; Henry A. Dehl, San Francisco, production and manufacture of pure asphaltum, etc., from natural asphalt; David Darwood, San Francisco, tubular metallic pail; Julius Fluck, San Francisco, cash and package carrier; James W. Graves, Lathrop, punch, Henry & Lase, San Francisco, filtering faucet; Charles E. Newell, San Francisco, can-labeling machine; same, automatic fountain for pasting machines; same, can-labeling device; Willis H. Ostrander, Merced, magazine shotgun; William S. Phelps, San Francisco, rail-fastening device; Charles A. Sparks, Sacramento, hoop or band fastener and tightener; Alfred Taylor, San Francisco, hydraulic pump extensor; Julius Wiesendler, San Francisco, purifying illuminating gas; Oregon—Charles J. Dante, Hillsborough, wood-splitting machine; M. E. Heacock and T. H. Lovejoy, Portland, car; Evan W. Jones, Portland, boiler or other furnace (2); Bradford Lane, Carlton, earth auger. Arizona—De Witt B. Williams, Prescott, car.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail, for telegraphic orders. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

STREET SWEEPER.—Peter B. Donahoo, Fresno. No. 469,551. Dated Feb. 23, 1892. This is an improved apparatus for sweeping streets and collecting dust and dirt therefrom. The invention is designed to sweep the dust from the streets, to elevate it by continuously acting buckets, and to deliver it into a receptacle carried upon the machine, by a single continuous operation.

HYDRAULIC ELEVATOR.—Alexander J. McAdam, S. F. No. 469,585. Dated Feb. 23, 1892. This is one of that class of hydraulic elevators in which the pressure of the water is directed upon oppositely moving parts which are connected together, whereby they move in unison, and are also connected with the cage or car to effect its travel. The invention consists in telescopic cylinders moving in opposite directions, said cylinders having beavies over which the hoisting ropes pass. It also consists in connection with said cylinders of the telescopic or extensible water pipes, by which water under pressure is supplied to the cylinders and exhausted therefrom; and it finally consists in the combination of said cylinders and the connecting chains by which they are enabled to move in unison.

HYDRAULIC MOTOR.—John W. Pack, S. F. No. 469,589. Dated Feb. 23, 1892. This is a water wheel designed for the propulsion of small machinery. It consists of a case of peculiar shape having a supply pipe extending centrally and axially through one end, an enlarged head having a step in the center of the end within the case, tubes or passages upon the sides of said head through which water is delivered, and in combination with this of a peculiarly shaped wheel consisting of a disk with curved buckets projecting from one face of it and surrounding the perforated head of the supply pipe, the shaft of said wheel extending through the opposite end of the case without packing and having its opposite end turning on an adjustable bearing. This simple little wheel is intended for driving sewing machines, etc., with the pressure from the city mains. It is very small and compact and is neat in appearance.

GANG-EDGER.—Frederick W. Cook, S. F., assignor to Frank P. H. Loftis, No. 469,543. Dated Feb. 23, 1892. This is one of that class of ma-

chines for cutting lumber into strips and usually known as "gang-edgers." The invention consists in the novel shifting mechanism for properly adjusting the saws and in the novel means for adjusting the feed-rolls. The general object of the invention is to provide a gang-edger, the shifting mechanism of which is simple, effective and accurate, and is not liable to bind or cramp in operation.

Mining Share Market.

SAN FRANCISCO, March 3, 1892.

The monotony of a continued inactive mining share market is semioccasionally relieved by inside cross orders. While this condition obtains, yet there is a well-grounded belief that stocks are being slowly but surely absorbed. For whom are the purchases made? In an open question, as to what for what purpose are the shares being taken in? Although everything points to stocks being concentrated, yet the writer has seen prices go quite low before a bona fide upmove sets in, as often as he has seen them go up on purchases.

Old and experienced mining men assert that the Comstock mines were never before in so good condition for successful mining, under the present system of working the mines and milling ore, or for paying dividends, with a change of management, so as to have the laws conformed to, under which the companies incorporated. Until honesty obtains in the working of the mines and in the milling of ore, outsiders had best fight, but outside shareholders pull in their horns to insiders and assessments to outsiders.

Mine managers have heretofore acted as if they were above the law, and that all judges are purchasable, but the suit against the directors of the Hale & Norcross Mining Co. must be convincing evidence that one Judge, at least, is not to be corrupted, and that juggling with laws is an unsafe game. Managers of the mill, through the aid of writers, cappers, camp followers and tools, are doing all in their power to create an unfavorable opinion against the Brokers' Combine, so as to thwart any move looking to outsiders acting more in concert, by which a better protection of their rights can be secured. The stock pools and mill rings are well organized and act in concert, but outside shareholders pull in every direction, and by not acting more in concert, they are incessantly slaughtered. In union there is strength, and it is the Brokers' Combine that offers the opportunity of joining force to successfully fight inside rings.

The Mining Stock Association fighting the mill rings on the mines, and the Brokers' Combine fighting the stock pools on the stocks, look very much like business. It is the first time within the history of the Comstock mines that insiders have been fought in such a way.

It is the generally accepted opinion that R. F. Morrow has been, and still is, manipulating the stock market in the interest of D. O. Mills, Francis G. Newland and the Sharon heirs. If this is the case, then it relieves others of the odium, in which they are held by many.

John W. Mackey, under oath, stated that car sample assays were a check against the rapacity of mill owners. This being his opinion, derived from actual experience, why does not the superintendent of Con. Virginia give the car sample assays? Not giving them confirms the many in the belief that there is an annex to the mill which reduces the ore.

The mining share market opened strong this morning, with an advance in quotations for Ophir and Mexican. The Gold Hill shares were lower and weak, while the Middles were barely steady. The market ought to do better, yet outside operators who took the market have been far better than it for other persons that have beaten the game.

Ever since the change in one of the Directors of the Quibota mines, prices for these asses-ed-racked stocks have been steadily declining, until they range lower than ever before. The Bodie and Razor Blade shares have ruled dull, with the latter selling lower owing to an assessment scare. Our correspondent who wants to know what has become of the money received from the sale of ore extracted from the Tuscarora mines, is informed that no one appears to know.

News from the Comstock mines continues uniformly good. It is an undeniable fact that the managers of several of the mines are developing the rich gold-bearing west lead, but whether for looking or not it is hard to say. It now looks as if the developments in the Hale and Norcross suit have disconcerted them, and possibly they may conclude to throw a few crumbs to outside shareholders. In Mexican the strike reported last week is said to be looking better. In Ophir they are playing around the body ore reported by the assayers some months ago. In Consolidated Virginia they have the rich ore lying to the west so far developed that Mr. Mackey can, if he desires, run into it on his return to this coast. Of course it will be through and by his superior knowledge as a miner that it is done, if it be done at all. It is said that important secret work is being done in Gould and in the Bodie, but for that matter, for that there is hardly a mine in the Comstock but what this is being done in. It looks as if they will soon be ready to show up the ore in one or two of the Gold Hill mines, but perhaps it will be necessary to levy and collect more assessments first. The Alta group of mines, it is claimed, will soon be ready for looking. The Bodie mill has stopped running on Bulwer ore and will start up on Bodie ore. The Bulwer superintendent has remitted to the office in this city over \$16,000, with the final cleanup to hear from.

THE SALTON LAKE.—A dispatch from Salton, San Diego county, says: From present indications the desert lake here will be much larger than last year. At present the lake is about half a mile wide, and after running along the Southern Pacific track for about two miles, extends off out of sight to the south. At this time last year there was not a drop of water visible, although there was a quantity a few inches below the surface of the sink. It was not until several months later that the floods occurred in the Gila and Colorado rivers, caused by melting snows, and it was only in August that the water in the Salton sink began to attract attract attention. The snow in the mountains at present is heavier than for years, and coming, as the water will when it melts, on land already in a large part saturated, a lake of unexampled extent will probably be created. Old residents believe that about 100 miles of the track of the Southern Pacific, which lies in the desert below the sea level, will be overflowed.

A VESSEL brought 930 tons of Alabama iron to this port this week, the first large shipment to this coast from that source.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized. The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. B. EVERETT.....Ass't Secretary.
H. PICHOLE.....Treasurer.

VICE-PRESIDENTS.	
NAME.	COUNTY.
R. F. Origsby.....	Napa

Robert McMurray, of Nevada County.	
J. B. Hobson, of Placer County.	

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

SEC. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of seven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

SEC. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

SEC. 3. The President and Secretary of the Association shall be ex officio President and Secretary of the Executive Committee.

SEC. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

SEC. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein proscribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

SEC. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall ren annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

SEC. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

SEC. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

SEC. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

SEC. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittee as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

SEC. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

SEC. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

SEC. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

SEC. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

SEC. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of such intended meeting.

SEC. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

A New and Valuable American book for Prospectors and Miners.
JUST READY.

The Prospector's Field Book and Guide

In the Search for and the Easy Determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining." Illustrated by 44 engravings, 12mo, 176 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—Chapter I. Preparatory Instruction. II. Crystallography. III. Surveying. IV. Analysis of Ores, Wet Method, Dry Assay of Ores. V. Special Mineralogy. Gold. VI. Platinum, etc., Silver. VII. Copper, and How Measured by Ores. VIII. Lead and Tin. IX. Zinc, Iron. X. Mercury, Bismuth, Nickel, and Cobalt. XI. Aluminum, Antimony, Manganese, and other Minerals. XII. Precious Stones. Appendix, Correction of Weights and Measures, Prospector's Pointers, Index.

BY THE SAME AUTHOR.

Recently Published.

A PRACTICAL MANUAL OF MINERALS, MINES AND MINING.

Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. Illustrated by 171 engravings. 8vo. 387 pages. Price \$4.50, by mail, free of postage to any address in the world.

Descriptive circulars giving the full tables of contents of the above books sent free to any one who will send his address.

A New List of Leading Books on Metal Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, Geology, etc., sent free to any one, in any part of the world, who will send his address.

Our new and revised Catalogue of Practical and Scientific Books, 83 pages, 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 3, 1892.

General trade continues only moderately fair, but confidence is expressed in more active times within the near future, the only decided drawback being the extortionate rates of freight at points on this coast demanding the use of a railroad company. It is this persistent high freight charges which kills the goose that lays the golden egg. It is the generally accepted opinion, probably derived from actual experience, that freights from this city to many local points are as high as they are from the East. Under this condition, how is it to be expected that our merchants, manufacturers and iron workers can successfully compete against the East, with its cheaper labor and lower-priced raw material?

General rains the past week dispels, for the time being at least, all fears regarding the crops, while additional snow deposits on mountain ranges emphasize the favorable prospect for an abundant supply of water during the summer months for both irrigation and mining purposes. The outlook for a large wheat crop gives promise of cheap coals, pig iron, etc., which will add largely to the interest of our iron workers.

The local money market continues easy, with a generally accepted opinion that after next week the rates of interest will largely favor borrowers on gilt-edged security. At the East, a seemingly temporary demand for gold is casting a shadow over the financial horizon, but as the fears are probably exaggerated, a reaction for the better ought to soon set in. For the year ending February 29th, gold exports have been \$2,561,922, and imports \$2,018,755. The exports of silver in the week were \$732,637, and the imports \$79,659. For the year the silver exports have been \$3,810,639, and the imports \$248,412. For the week ending Feb. 29th, the gold exports aggregated \$2,600,000. The large exports of gold in the last half of February is accepted as due to the selling of American stocks and bonds by foreigners desirous to take advantage of the high premium ruling for gold. The New York *Mail and Express*, Feb. 26th, says that "in connection with the current outflow of the precious metal it can be stated that a prominent drawer of sterling bills on yesterday received a bid from London of 75 3/4 pence for American gold, but declined it for the reason that there was no inducement to make the transaction at the then ruling rate of exchange. To-day it was reported that the German banks were paying more for gold than the Bank of England, and the fact that all the shipments thus far have been to the continent, gives color to this report."

MEXICAN DOLLARS—The market is barely steady at around 7 1/2 cts. The steamer *Belgie* left the past week for China. She took out 224,524 dollars for Hong Kong and 40,000 dollars for Yokohama.

QUICKSILVER—Receipts the past week aggregated 618 flasks and exports by sea two flasks to Mexico. The market has a stronger tone with an early advance in prices not at all unlikely.

SILVER—The market has every appearance of grounding around bottom; if this proves to be the case then it is only reasonable to look for much higher prices before the Spring months pass. The news from Washington is more favorable to the passage of a free coinage bill. It is altogether probable that if such a bill should be passed, President Harrison will sign it. There are several reasons why he will probably sign the bill, not the least of which is that by so doing he takes the silver question as an issue out of the presidential election. The growing sentiment abroad in favor of bimetalism and a desire expressed by the gold countries to have an international convention looking to favorable action on the subject, removes one of the only stumbling blocks in the way of the passage of the free coinage bill in this country. The advancing premium paid for gold by European countries forces the conviction that the supply is inadequate to the world's requirement which will force silver to the front to supply the deficiency. At the time the present law compelling the mint to purchase 4,500,000 ounces of silver bullion a month went into effect the writer took occasion to say it would prove a failure, owing to there being no provision requiring its coinage and being stored it would prove a menace to the market and drive silver value to low prices. This position time has verified to be correct. Writing on this subject the last London *Economist* to hand says: "The fear that the United States is drifting into monetary difficulties has already disorganized the silver market, which is kept in a chronic state of apprehension lest the Treasury should be compelled to dispose of a portion of the enormous stock of the metal it has accumulated. That is the root cause of the extreme weakness of the silver market, and it is a menace also to the stability of the money market, since it is impossible to say to what devices the United States Treasury may be forced to have recourse in its efforts to maintain the parity between gold and silver."

The steamer *Belgie* for Hong Kong took out \$46,000 of silver bullion from this port.

LIME—Receipts the past week aggregated 3563 bbls. The market is barely steady. Continued low prices ruling for cement cuts off quite a demand from builders.

ANTIMONY—The market is weaker. New York mail advices quote as follows on wholesale quantities: 11 cts. for Hallett's, 12 1/2 cts. for 13 cts. for LX, and 15 cts. for 15 1/2 cts. for Cookson's.

PIG IRON—Imports the past week aggregated as follows: Liverpool 314 tons, Swansea 379, Baltimore 937, total 1630 tons. That received from Baltimore comes from Alabama, and is, as far as we can learn, the first consignment of pig iron received at this port from the South. This shipment is to be followed by others, for it is said that 4000 tons have been sold to the following foundries: Atlas, Fulton, National, Risdon and Union Iron Works and Steiger & Kerr. The iron is said to be both softer and stronger than the ordinary run of pig iron from Pennsylvania. A contemporary says: "It is claimed that pig iron is selling at the furnaces in Alabama as cheaply as at the furnaces in Scotland. It costs \$5.15 to freight the iron from the mines to New York and \$3.00 from that port. It can be sent to Mobile or Charleston for 95¢ per ton, and if vessels could be induced to load at either of those ports for San Francisco as cheaply as at New York, the cost of carriage would not exceed \$9, which is less than freight and duty from Scotland." The local market is weak and irregular. The prospects for a large wheat crop unsettle values for parcels in all positions.

TIN—Imports the past week aggregated 67,994 boxes of plate from Liverpool. The market is dull and heavy, owing to canners being well-supplied for their near-by wants.

LEAD—The market is more or less unsettled. The East reports that the firmness there is due to labor troubles at the mines in the Idaho dist. Outside of this, the influences on the market are against the selling interest.

COPPER—The market has shaded to a still lower range. Iron Age reports that the "Annet and Hecla Company have recently taken orders for about 100,000 lbs. of Lake Superior ingot at 10 1/2¢ for March and later delivery. The English market is still under speculative influence, with the bears in the ascendency.

COKE—The market is barely steady, notwithstanding a free consumption.

COAL—Imports the past week aggregated as follows:

Tacoma 5200 tons, Comox, 4150, Newcastle (N. S. W.) 1403, Liverpool 9224, Nanaimo 5550, Sydney 2520, Baltimore 1830, Swansea 5563; total 35,447. The market for spot is weak, we might say somewhat demoralized, with correct quotations very hard to obtain. The consumption shows a falling off in household coals and also in coals used by steam vessels in harbor. The railroad consumption is also higher. With the incoming crops, the steam and railroad demand will probably be larger than ever before. For shipments, buyers are offish, unless offered concessions. Improved crop prospects are the prime factor in creating a conservative spirit with buyers.

Eastern Metal Markets.

NEW YORK, March 3.—The following are the closing prices the past week:

	Silver in New York.	Copper.	Lead.	Tin.
Thursday.	91 1/2	10 7/8	4 20	19 50
Friday.	91 1/2	10 65	4 20	19 55
Saturday.	91 1/2	10 60	4 20	19 50
Sunday.	91 1/2	10 60	4 20	19 50
Monday.	91 1/2	10 60	4 20	19 50
Tuesday.	91 1/2	10 60	4 20	19 50
Wednesday.	91 1/2	10 60	4 20	19 50

NEW YORK, March 2.—Pig iron is in good demand, but prices still favor buyers. Borax is steady. Antimony is easy. Tin is slightly firm in sympathy with silver. Copper is barely steady. Lead is steady. Quicksilver is firmer with a disposition to advance prices.

G. & E. PENNINGTON & SONS,
STEEL WORKS.

MANUFACTURERS OF

Best Refined Cast Tool Steel, Machinery and Hammer Steel,
Steel Piston Rods, Shear Blades, Lathe Spindles, and all kinds of Steel
Forgings Made to Order.

REFINED BAR STEEL IN OCTAGON, ROUND, SQUARE OR FLAT, MADE IN SIZES
AND LENGTHS TO ORDER.

Miners' Drill Steel, Picks, Crowbars, Sledges, Hammers, Etc.

Chainsall Sizes and Lengths Manufactured to Order. N. B.—Drill Steel, any Length
from one to thirty feet.

OFFICE AND WORKS:

218 and 220 FOLSOM STREET, - - - SAN FRANCISCO, CAL.

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.

The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, BITUM and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

CORRUGATED IRON,
Black, Painted and Galvanized, for Roof and Sides of
HAY BARN, DRY HOUSES, STABLES, ETC.

W.W. MONTAGUE & CO.
SAN FRANCISCO—SAN JOSE—LOS ANGELES.

Educational.

JOHN T. EVANS,
Assay Office and Chemical Laboratory,
Rooms 46 and 47 MONTGOMERY BLOCK, 628
Montgomery Street, San Francisco. For nearly 15
years with Thomas Price, as Chief of the Ore-Assay and
Analytical Department. Lessons given in Assaying and
Chemistry.

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frue" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt . . . \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt . . . \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if used be. Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont Street, San Francisco, Cal.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Location of Works, Grass Valley, Nevada Co., Cal.
Grass Valley, Nevada Co., Cal., Nov. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrator is the equal, if not superior to any other style of Vanner or concentrating device.

DAVID McKAY, Jr.,
Supt. North Star and Original Empire Mining Co.
N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" (concentrators), extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here. I am, my Dear Sir, Yours faithfully,
S. HARRIS, Manager.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was Awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891.

More than Double the Capacity
With One-Half Less Power and Occupying Less than
One-Half the Space of any other Concentrator.

Built of Best Steel and Wrought Iron.
STRONG AND DURABLE.

Price..... \$575 f. o. b.
Send for Catalogue and Testimonials.

The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking; plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

PATENTED,
Aug. 19, 1890.

G. O. E. WOODBURY, Man'fr, 213 to 219 First St., San Francisco.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

Improved Rock-Breakers.

The Booth continuous-crushing combination rock-breaker is a machine devised to meet the demand of millmen for one of large capacity, giving a finer and more uniform product and increased capacity over the ordinary rock-breakers. The Booth machine consists essentially of two moving jaws, one pivoted above its crushing face and operated by the well-known Blake principle, the other moving jaw being placed immediately beneath it, pivoted below its crushing face and operated on the Dodge principle. Each crushing movement is thus called upon to do the work for which it is best suited, one for coarse and one for fine crushing.

The crushed rock falls from one jaw to the other, the lower edge of the upper jaw being in all positions in advance of the upper edge of the lower jaw. Both movements are reciprocal and driven from the same eccentric shaft by entirely independent connections, so designed that it is possible to disconnect one movement and still run the other. It will be readily seen that as the eccentric shaft revolves, first one and then the other jaw approaches the stationary die, each receding as the other makes a forward crushing movement, giving a practically continuous crushing effect. Among other advantages derived from this division of the work are the greatly reduced strains upon all parts. It will also be noticed that all the tensile strains through-

wrench being provided for them. Adjustment of the upper part of the lower jaw is also possible by means of the nuts on the ends of the connecting rod. As the size of

wear slightly below the steel, giving a continually corrugated surface, having a superior crushing effect, preventing all slippage of the material and largely increasing

in the engraving. The Blake machine itself is well known everywhere. Attention is called to the wedge adjustment in the center of the pitman, by means of which the size of product is quickly and easily adjusted. As this adjusting wedge tapers on each side, instead of on one side only, as is the case with the back wedge of the old style Blake machine, only about one-half as much movement of the adjusting nut is required to effect the same change in size of product. This style of adjustment also materially shortens the rock-breaker as compared with the old style machine, giving it a stronger and more compact frame.

The bolts which take the crushing strain pass through hollow columns cast on side frames and running the whole length of the machine, thus making the side frames very strong and rigid. A loose, babbitted gib is fitted in the pitman-head and held firmly against the eccentric shaft by means of a spring set up by an adjusting wedge. This prevents all pounding and heating in the eccentric journal and insures quiet and cool running in this important bearing. Two pull-back springs are provided instead of one, thus giving a better effect and reducing liability to breakage. A safety device is provided in a cast iron plate placed under the head of the nut supporting the wedge in the center of the pitman. This plate is made strong enough to stand all ordinary crushing strains, but will break and allow the toggles to fall back, should a pick-point, sledge or other foreign matter

BOOTH'S COMBINATION ROCK-BREAKER.

SECTION OF COMBINATION ROCK-BREAKER.

THE BOOTH IMPROVED BLAKE ROCK-BREAKER.

out the machine are taken by wrought iron or steel rods, while the compression strains fall upon cast iron, the design of the machine being about perfect in this respect. By an arrangement of springs all lost motion of bearings is at once taken up.

The adjustment of the size of output in the lower jaw is made by means of the nuts on the lower extension rods, which take the crushing strain from the pivot boxes, a

the product does not depend upon the upper jaw, adjustment here is seldom required, one in the life of a shoe and die being all that is wanted—just sufficient to keep its lower edge in advance of the lower jaw. An extra toggle is provided for effecting this. The shoes and die consist of alternate layers of wrought iron and hardened steel bars set upon edge and secured within forged steel bands. The wrought iron bars

the capacity of the rock breaker. The advantages claimed for this machine are large capacity; continuous crushing; large receiving capacity in proportion to fineness of output; improved crushing faces; reduced wear and tear and liability to breakage, due to dividing the work; and great strength.

Other improvements in rock-breakers, also designed by Mr. Booth, are those applied to the Blake rock-breaker, and shown

fall in the jaws, preventing injury to the machine. The shoe, die and toggle seals are made of cast steel and the eccentric shaft of forged steel. The design, metal and proportions throughout have been determined from actual practice, and with the other improvements make this an unusually strong and efficient machine. Both these rock-breakers are manufactured in this city by the Risdon Iron and Locomotive Works.

A Manual of the Steam Engine.

"The Manual of the Steam Engine," for engineers and technical schools (advanced courses), by Robert H. Thurston, published by John Wiley & Sons, is one of the most important scientific works which has recently been issued. The first part of the manual, already published, constitutes in some sense an independent work, and may be considered an epitome of the purely scientific side of the subject, an expose of the theory of the steam engine, considered as a thermodynamic machine, and its efficiencies as such. Its purpose is twofold; first, the development of the mathematical processes which enable the engineer to trace the flow of energy into and through the engine, and to exhibit the direction of its variously distributed streams and their useful or wasteful disposition; second, the application of the facts, principles, equations and formulas of thermodynamics and of mathematical physics, thus collected into a system and a theory, to the computation of the quantities of heat, steam and fuel to be required for the production of power in a specified engine; and, further, the determination of just what proportions of engine and what distribution of steam will probably give the highest commercial result.

This treatise, perhaps too extensive for any except the higher order of technical schools, will serve well for the purpose of instruction in the senior classes of undergraduate courses in engineering. For the specialist and practitioner, however, this first volume is but the first step in a much larger course of study and construction. For his purposes, the introductory must be followed by a somewhat extended study of principles and current practice in the design, the construction and operation of the machine. It is this division of the subject which is treated in the second part of the work, which has been placed on our desk by Osborn & Alexander of this city, who have the book for sale.

The second part of this "Manual of the Steam Engine" is intended to present, as concisely as possible, the later and more usually practiced methods of design, construction and operation of the engine, as based upon the technical knowledge and experience of contemporary specialists and as illustrated in the best current practice. The first part of the work is for the study; this second part for the office.

The author states that he has been led to attempt the preparation of this second portion of the work in the endeavor to provide suitable instruction for graduate students in mechanical engineering. The volume offered to the advanced student and practitioner will be found to contain a condensed description of the operations involved in the design, construction and management—including preservation and repairs—of the steam engine. The introductory chapter on design includes the general discussion of the proportions of the compound and other multiple-cylinder engines, as well as that of details. The great development of this class of machines is well shown. The study of the valves and their gears is made mainly by the processes of Zeuner and other graphical methods. The chapters on construction and erection, and on the operation and care, are concise; but they are based upon long practical experience, observation and application.

The account of material used is abridged from a larger work by Prof. Thurston. The chapter on specifications and contracts is intended to be an exceedingly condensed discussion of that important subject. The last chapter is the first attempt to introduce the financial element into the theory and practice of steam-engine construction.

The book is splendidly printed and the illustrations carefully and accurately made. There are but eight chapters, as follows: Design of the steam engine; valves and valve motions; regulation, governors, fly-wheels and inertia-effects; construction and erection; operation, care and management; engine and boiler trials; specification and contracts; finance and costs and estimates.

Prof. Thurston is a recognized authority on this subject all over the world and no one is better fitted for writing a manual of the steam engine than he is. He has written several important technical books before, but nothing equal to this one. It is a standard work of study and reference, and will be in the library of every mechanical engineer in the country.

The Omaha Mine Accident.

The worst mining accident that has occurred at Grass Valley for some years took place last Saturday morning, Feb. 27th, in the Omaha and Lone Jack Cons. mine. An explosion of giant powder instantly killed young Phillip Cadden, badly injured Thos. Penberthy, nearly destroyed the sight of Charles Nile, and inflicted lesser injuries upon Wm. Meiers, Matthew Laity, Wm. Coombs and Edward Palmouter. The day shift men were just going below. The first truck, conveying the seven men above named, had gone down to the No. 10 level in the Lone Jack ground, and were about to commence work. They had put their dinner buckets in a customary place, and several were stooping down burning the ends of their candles so they would light readily when they would be needed for use. A few feet away there was a recess in the side of the drift, which was about breast high to a man, which had been made as a receptacle for the cartridges that were used in blasting. The recess had a cover to prevent any sparks falling from candles upon the cartridges when the men went to obtain them. The men before going to work were in the habit of taking cartridges from this and like receptacles in the mine before going into the stopes or to the end of the drifts, where they were to be used. While the seven men were in the drift, near where the cartridges were kept, there was a sudden explosion, and in a short time it was ascertained that Cadden was killed and all the others hurt.

The coroner's inquest failed to make any discovery as to the cause of the explosion. The Grass Valley Union says it is now thought that young Cadden might have stuck his candle against the side of the drift above the place where the box of giant powder caps were kept, and that a spark from it fell into the box and communicated to the fulminate in the caps. As the chief force of the explosion struck him, he must have been nearest to it. How many caps were in the box is not known, but when full, each box contains 100. It is evident that not many cartridges exploded, otherwise the drift would have been torn up considerably; but it was slightly affected by the explosion, and the car track was not disturbed at all.

LOSSES BY FIRE OF COAL-LADEN SHIPS. A correspondent inquires why it is that the cargo of coal-laden ships so often takes fire, with the general destruction of hot ship and cargo, and sometimes to the great danger and even loss of life. The question is also asked if gas generated from the coal is liable to take fire from pressure or otherwise, and whether any device has ever been patented to remove the gas from the hold. In reply: Safety devices in the form of specially constructed ventilators have been employed to allow the gases generated to freely escape from the hold. In regard to the origin of fires: They are not generally, if ever, caused by the presence of gas, but from heat generated from the decomposition of iron pyrites in the coal. Certain coals, if allowed to come in contact with water, will very soon take fire from that cause. Much of the coal from Mount Diablo and other places will soon take fire if left exposed to rain in an open atmosphere. Fires on coal ships are almost always due to water in some way coming in contact with their cargoes. The only way to prevent fires on coal ships is to keep all water away from the cargo.

A NEW USE FOR OIL AT SEA.—The use of oil as a means of reducing the friction on the sides of a ship, caused by the passage of the ship through the water, and thereby increasing her speed, has been suggested. The idea embraces many features that would seem feasible, but whether or not it would practically make any difference remains to be seen. The oil is fed in minute streams against the sides of the vessel by means of a series of perforated pipes, adjusted to the bow and extending from the keel to the water line, or higher. The progression of the craft passes the oil back toward the stern, and at the same time the inward pressure of the water prevents the oil leaving the sides of the vessel without doing its duty. Perhaps the oil might be more thoroughly distributed were the ship built with grooves along the sides. Another suggestion is to submit the oil to a chemical treatment, whereby it would prevent weeds and barnacles adhering to the vessel's bottom, and thus increasing the scope of the oil's duties.

EXPERIMENT WITH STAY BOLTS.—The number of headings which an ordinary 7-8 inch stay bolt will stand when riveted into plates of unusual thickness, one end being fixed and the other end moving one-eighth of an inch, has been proved by experiment to be from 2000 to 5000.

Early Hydranlicking.

A Test of Small Nozzles in 1856.

J. E. Emerson in Scientific American.

In 1856 I was chosen as one of a committee of three to witness a test of hydraulic mining, for the purpose of deciding a dispute which had arisen between different manufacturers of hose nozzles. One of the parties had more than a half-dozen made, in order to satisfy himself which was the best. The nozzlemen generally stood from 20 to 30 feet from the gravel bank. On this occasion the water came down through wrought iron pipe about eight inches in diameter, which ran down a steep hillside; to this was attached a canvas hose of eight thickness, and this was wound solid with about a 3/4 inch manilla rope, the lower end being tapered for say 50 feet to about four inches at the lower end; to this the strong rubber-lined woven hose of eight or ten thickness, and to the end of this, the brass hose. The hoseman on this occasion was a short-set, very strongly-built man, with a strap of leather over his shoulders and attached to the hose. The perpendicular fall of the water on this occasion was 186 feet, this being the most powerful pressure ever used for the purpose to that date. The gravel was what we called cement-gravel, so hard that it could scarcely be picked up. The extreme end of each nozzle was from 1 1/4 to 1 1/2 inches in diameter, varying in order to determine which would do the best work, or rather the most of it. In addition to the gravel, the ground contained large boulders of various sizes. One of the contesting parties claimed that the best results would be obtained by having the brass hose tapering from the canvas to within about six inches of the end, and that six inches to be of exact size; but the other party contended that the best results would be produced by having the nozzle tapered from the butt to the point as a true radial from 20 to 30 feet from butt to point; and that, if the radius was shorter than this, that the water would scatter after it reached the radial point. The man bolder or operating the nozzle would quiver and tremble as the water poured from the nozzle, and he compelled to stand with his feet braced apart to keep from being thrown down. On the bank stood a knarly white oak, about 18 inches through. Some gravel had been washed from under the roots of it. I suggested to the nozzleman to try each nozzle at 25 feet distant on the bark of the oak. This he did. The first nozzle with the six-inch parallel point took off some of the coarse outside bark. We then took the nozzle tapered to a radius of 25 feet, and it peeled the tree wherever it struck it, even cutting into the wood and tearing out small splinters. This nozzle we decided to be the best for hard gravel washings. The victor published our decision all over the State, and sent out circulars. He offered us each \$100 in gold, which we, of course, declined, we only allowing him to pay our expenses and \$10.

I lost \$5 of that \$10 on a bet with a gentleman who knew more than I did. I bet him \$5 that I could split the stream at the end of the nozzle with my penknife blade. So I went into the blacksmith shop and on an oilstone, whet my knife as sharp as it could be. I scratched the end of the nozzle across the center so as to have a channel for my knife to run in, but after working for over half an hour and getting as wet as a drowned rat, and rather a laughing stock, I gave it up and handed him his \$5 gold piece. It was singular to put one's hand against the stream at the very end of the nozzle, for it seemed as smooth as oil, and the end of one's finger merely made an apparent dent in it.

Many miners were badly hurt, and some of them killed, by being knocked down, by stumbling over rock, and getting caught in front of the stream and driven against the banks or into the gravel. On this trial I saw immense boulders turned over by the water from the nozzle of the hose, that I do not think five men could roll over by hand.

COAL FROM UNGA ISLAND.—A company has recently been formed by local capitalists to work the extensive coal fields at Coal Harbor, Unga Island, Alaska. John C. Green, the manager of this new company, made a personal examination of these coal fields during the summer, and he reports the deposit on Unga Island to be practically inexhaustible. To use his language: "There is coal enough there to supply the United States." The new whale-hack steamer will be brought into use, and it is claimed the coal can be laid down here at a cost of \$3.50 per ton. Interested in the enterprise are Irwin C. Stump, Frank McLaughlin, R. C. Chambers, the superintendent of the big Ontario silver mine, Utah;

A. S. Baldwin and C. W. McAfee. A vessel may be sent up within 30 days. Statistics show that San Francisco is yearly paying out from \$12,000,000 to \$15,000,000 for imported foreign coals, and has actually paid out during the past six years not less than \$75,000,000 for its fuel supply.

British Coal Miners.

Cablegrams from London dated March 3rd are to the following effect: The Leicestershire coal mine owners to-day gave notice of a further advance in the price of coal. The latter advance makes a total rise of seven shillings per ton within one month. This increase falls heavily on the poor. The rise is attributed to the already determined intention of 460,000 miners to cease work in less than a fortnight in their efforts to prevent a reduction in wages.

The action of the miners in announcing that they would go on a strike on the 12th inst. and the rapid rise in the price of coal following that announcement, are leading to a panic. The cold weather, which led to the consumption of a larger quantity of coal than usual, continues to prevail, and this fact caused the alarm to become greater than would otherwise have been the case. No one knows where the advancing price will stop, and consequently everybody is anxious to lay in enough coal now to tide over a two weeks' strike. The merchants declare if the present demand is continued the stocks will last for only ten days. The newspapers all publish articles in reference to the situation and urge the public not to become panic-stricken, as prices cannot make much further advance, owing to foreign competition.

Nevertheless the retail dealers are flooded with orders and all the coal wharves and depots are besieged. Coal is selling in London to day at \$10 per ton.

One week from to-day 460,000 miners will stop work. Another half-million workmen in the iron mills and factories will be thrown out of work.

The well-known Belgian socialist and labor leader, M. Volders, announces from Brussels to-day that the Belgian working-men's party and Miners' Federation will order the Belgian miners to restrict the output so that no coal can be shipped to England. In their strikes, the Belgian miners have received substantial aid from the miners of Great Britain, and, now that the opportunity offers, their leaders think they ought to aid by every means, their British brethren.

The British miners are striking to prevent a threatened reduction of wages. By restricting the production they hope to force the consumers to pay more for coal so that the mine owners will not cut the miners' wages. The last two or three years have witnessed a very material revival of the coal industry. It appears to be generally admitted that the miners have since 1888 received advanced wages that have in most districts reached about 50 per cent over the wages paid in that year.

It is estimated that the average wages paid in and about the mines to all classes of employes is about \$5 per week all the year round. There are employed in the coal mines 602,517 persons. The experience of the coal trade shows that when the range of wages is pretty good, men are drafted in to it from every sort of outside industry and occupation, not even excluding sailors, shoemakers, butchers and bakers.

It was announced this afternoon that the coal owners of Durban have definitely determined to lock out 80,000 miners within a short time if they refuse to accept a reduction in wages. About 35,000 miners in Scotland, the midlands and in the north will have a holiday of two weeks from March 11th, with a view to reducing the stocks of coal on hand.

IT MADE NO MISTAKES.—Some of the journals of the State of Nevada are dissatisfied because the late State Convention of the miners of California had no speeches or resolutions in favor of the free coinage of silver. The convention was called for the single purpose of taking action that would result in the restoration of hydraulic mining, and not to discuss coinage, tariff, or any other question of political economy. The convention would have failed in the harmonious action that characterized its proceedings if it had gone outside of the business for which it was called. It was a thoroughly level-headed convention, and did its work well, and to the satisfaction of every interest in the State, and in that respect was the most remarkable assemblage that ever met together in the State, considering the long and bitter struggle that had existed between the miners and farmers.—Grass Valley Union.

The Bennett Amalgamator.

A Machine for Saving Flour Gold.

E. S. Bennett, inventor of the noted Bennett amalgamator, is about to have his 15 long years of struggle, study and litigation over his great placer machine rewarded.

An organization of immense significance has just been consummated, says the *Denver Times*, with a capital of \$10,000,000, for the exclusive right to utilize his invention within the State of Colorado, and \$23,000 has been paid to him already on account of this right. Parties from California are also negotiating with him for the exclusive right to that State, agreeing to pay for the same \$500,000. The direct cause of this sudden interest in Bennett's remarkable patent may be traced to the recent results of its few months' work at Arvada while being operated in a perfected form.

The company was originally formed for the purposes of experimenting and perfecting the machine in Summit county with \$1,000,000 capital, and not a share has ever been sold for less than \$100, the par value.

A meeting of the Board of Directors was held immediately after the recent election and the reorganization of the company effected. The recapitalization was placed at \$10,000,000, taking place within the next 60 days. It was also decided to erect a \$250,000 plant in Denver for the purpose of manufacturing the machine. The condition of the financial interests of the company is in a highly satisfactory state, the assets being \$235,383.65 and liabilities nothing.

The problem before the mining world ever since the discovery of gold, as every mining man well knows, has been the ability to handle sufficient dirt to make placer mining a success, together with the certainty of saving the microscopic atoms which are held in suspension in water. This is the gold that has always heretofore been irretrievably lost in the operation of the sluice box and milling system.

The company purchased a strip of barren land at Ralston and Clear creeks. It had been worked years ago and was considered fair placer ground, but it was supposed that it had been entirely worked out. The closest panning only showed two cents per cubic yard. In about one month's steady work, and in spite of the fact that the Bennett machine only handled old tailings, from 15 to 20 cents per cubic yard were saved, and a greater yield is expected as they get into virgin territory. The singular part of this work lies in the fact that a triple quantity of infinitesimal or microscopic gold was saved as compared to the coarser or, what is commonly termed by mining men, flour gold. This seems to demonstrate the fact that the machine saved all of the precious metal left by the original workers.

An idea of the infinitude of the fine gold saved may be gained from the statement that in a phial of water it may be shaken until the solution is black. A name may be written on paper and afterward burnished until the atoms being rubbed into the porous substance glitter brilliantly. Although gold is universally admitted to be 19 times heavier than water, yet these microscopic particles are so light that after the denser atoms have sunk in a phial after shaking, there is sufficient time left to pour off the floating atoms.

Fully 75 per cent of the product of the machine has been the finest gold. The machine scoops up the placer earth, carries it to a hopper, from whence it enters a drum, the boulders passing around a screw and being thrown out on the opposite side, while the fine dirt passes through a fine mesh on the plates. These are of copper, plated with silver and coated with amalgam. Each atom is forced into unavoidable contact with mercury 400 times, each time under the most favorable conditions for instant amalgamation. This is the principle of the machine in brief—a patent that promises to revolutionize placer mining. The power is wholly electric, and only three men are needed to operate.

ALLOYS OF SILVER.—That alloys of silver can be electro-deposited on a commercial scale is not a new discovery, for the alloy of silver coin has been deposited ever since the discovery of the art. The advantages gained by using the alloy, rather than the pure metal—are greater hardness, combined with cheapness of material and reduced liability to oxidation. On the other hand, the difficulty of burnishing the metal is increased, and the distinguishing white color of pure silver must be sacrificed to some extent. The color can, however, be improved by leaving the plated work in the bath for some little time after the current is switched off. This fact is due, no doubt, to copper being electro-positive, relatively to silver, in solutions of cyanide of potassium.

Plymouth Con. Gold Mining Company.

The ninth annual report of this corporation makes the following exhibit:

Gold product from mines.....	\$19,774 80
Miscellaneous receipts.....	2,350 16
New receipts.....	\$22,124 96
Surplus carried over from 1890.....	22,258 93
Year's income.....	\$44,383 89
Operating expenses and taxes.....	40,658 07
Surplus Jan. 1, 1892.....	\$ 3,725 82

We append what the directors report touching the year's explorations and present underground situation of the property:

"When our last annual report was submitted to the stockholders, work was being prosecuted on the east parallel vein, running both north and south. Considerable ore was found in both drifts. The tunnel south was run about 185 feet, when the vein matter gave out and work was suspended. The north tunnel was driven about 70 feet. The tunnel yielded good ore, but the vein was narrow. An upraise was decided on in the north tunnel and commenced the first week in February. The ore varied from one to two feet in width and was rich and poor alternately. In some places there were small quantities of exceedingly high grade.

"This upraise was carried to a height of nearly 200 feet, the vein widening at the top to nearly six feet, with a good grade of ore. With so favorable an outlook, the management felt justified in commencing a new tunnel in order to work this rock advantageously. This new tunnel was commenced early in July, and has now reached a length of 700 feet. We are expecting daily to strike the lode line. From the point of contact it is about 200 feet to the upraise. It is possible that some portion of this 200 feet will be in ore. We anticipate finding a considerable body of good rock in the vicinity of the upraise, possibly enough to run our mill for some time.

"The mill was started on the 8th of April, running ten stamps, producing fair results. With several interruptions, the mill was run through the summer, and also for a part of the month of October. Lack of ore compelled the superintendent to shut down the mill entirely for the present."

The present company was formed June 1, 1883, by the consolidation of the Empire, the Amador Pacific and the Plymouth companies. The mines were well developed, and a considerable amount in dividends had been paid. Prior to the consolidation, gold bullion to the amount of about \$2,500,000 had been produced.

The following is a statement of all the receipts and expenditures of this company from organization, June 1, 1883, to Jan. 1, 1892, a period of eight years and seven months:

June 1, 1883—Cash on hand at time of organization of company.....	\$ 153,319 80
Gold bullion produced by mine as follows:	
To Jan. 1, 1891.....	\$4,045,982 88
For year 1891.....	19 774 81
Total bullion produced.....	\$4,065,757 69
Miscellaneous.....	5,667 63
	\$4,071,425 32
Total receipts.....	\$4,224,715 11
DISBURSEMENTS.	
Operating expenses.....	\$1,723,337 12
Construction since June 1, 1883.....	217 682 17
Fifty-seven dividends, averaging \$40,000 each.....	\$2,280,000 00
	\$4,221,019 29
Cash on hand Jan. 1, 1892.....	\$3,995 82

A Safety Car Brake.

Next to a proper coupling device nothing is more needful to a train than an easy, prompt and sure-acting car brake. Many hundreds of lives are lost annually from imperfection in these two devices. The necessity of the former is considered so important that attention was called to it by President Harrison in his last annual message. The importance of the latter is scarcely, if any less. One of the latest inventions in connection with the brake is one wherein the combined principles of the screw and spring pressure are applied.

It is an established fact that the screw is one of the greatest mechanical powers. A car brake has been lately invented which bids fair to revolutionize the system of car-braking. It consists of a right and left screw, with traveling nuts thereon, hung in the center of a car, connected with yokes passing around elliptic springs, which are attached to the shoe beams, thereby producing an elastic pressure of the wheels; the screw to be operated by sprocket wheels and chain belts, or with gears, from the platform at either end of the car. This principle can be applied in different ways, to suit different kinds of railway vehicles. This combina-

tion of screw and spring pressure appears to be the true principle of car-braking, and has only to be tried to be appreciated by the public. No jarring a person off the seat need happen by this kind of pressure being applied to the wheels, as the screw graduates the power very nicely, and is effective in every particular. Many lives might, in all probability, be saved and innumerable accidents averted in the United States alone, by using such apparently reliable action. A steam train can be stopped quite as quick and with less jolt than with any other method owing to the elastic grip it gets upon the wheels, which cannot be got in any other way with safety. The invention seems to be one of much promise and will, no doubt, be thoroughly tested.

The Pegleg Mines.

The San Diego *Union* says: There arrived on the steamer Santa Rosa a party of four intrepid explorers, Thomas L. Doran, John K. Bell and George Curtis of San Francisco, and H. L. Forest of New York, who are starting on a search for the famous Pegleg mines. Years ago, the old trapper, Pegleg Smith, was found insane from thirst by a party of emigrants wandering about on the desert this side of Yuma, having in his possession several large nuggets of solid gold. The party carried him with them until he recovered, but he could give only a general idea of the location of his find, and that it consisted of three little hills of gold, one of which appeared quite black at a distance.

The party will fit out in this city and will leave on an expedition which may make them millionaires, or, on the other hand, cause them to leave their skeletons bleaching on the hot sands of the desert, as so many have already done in the same search. They will take two teams, four mules and eight or ten burros. The mules will haul the wagons from camp to camp, while the burros will be used to carry water and provisions on trips of a week or so from the headquarter camp. Leaving San Diego, the party will follow the old Yuma road to the desert, and will then strike out northward to Carrisa creek, where the headquarter camp will be located and provisions for six months stored. From Carrisa creek Doran and Bell will explore the country in a radius to about 40 miles to the northwest and northeast, in which section they are confident the Pegleg mine lies. It is their intention to make a clean scouring of this portion of the desert, and to settle for all time the existence or nonexistence of the famed lost mine. In his former exploration, Doran demonstrated that it was not to the south of Carrisa creek.

SANTA PAULA is a thriving town of about 1500 people, lying near the center of Ventura county and upon the S. P. R. R. It is 66 miles from Los Angeles and 15 from Ventura. Santa Paula is the center of the oil industry of this State. The Union Oil Co. handles the product of about 60 oil wells, the yearly output of which is stated by the Santa Paula *Chronicle* to be 500 barrels per day. From this product is manufactured naphtha, benzine, illuminating oil, lubricating oils and printers' ink. The manufacture of aniline dyes and many other articles will begin as soon as proper buildings can be completed. About 750 men find employment in the oil business, and the property of the Union Oil Co. alone is thought to be worth \$2,000,000.

AMERICANITE—A NEW EXPLOSIVE.—Americanite is the name of a new explosive of great power. The principal ingredient is nitro-glycerine; the other component parts are secret. It is said to be insensible to shock, and explosive at will. It withstands friction, and if ignited with a match, simply burns like a candle. An American expert reporting upon it states that the advantage of being able to use with safety an explosive of a force equal to nitro-glycerine fired from any gun in existence and with terrific effect at a long range, is evident. With so powerful an agent, the problem of coast defence is able almost to resolve itself into one of range, and our great cities may be made comparatively safe with very little expenditure.

TO REDDEN STEEL.—A method for reddening watch hands or other small pieces of steel work, is given on the authority of a practical horologist. Make a paste from two parts chloride of silver, two parts carmine, and one part of Japan varnish, heated together. Spread some of this over the surface of the steel work, and lay it face upward on a thin sheet of copper, applying heat then until the tint desired is obtained.

Cable Alarm Boxes.

In order to avoid such accidents as have occurred of late on the California street cable railroad, the managers of the line have made arrangements for the introduction of a system of alarm boxes to be placed along the road.

"Our telltales in the power house," said Superintendent J. W. Harris to a *Call* reporter, "indicate at once when there is anything wrong with the cable as it passes through the house, but they do not tell when there is a loose strand out on the line.

A strand down at Kearny street may get loose and roll up for 100 feet or so and nothing be known of it in the power house until it is reported by the conductors. Now, the object of the new alarm system is to give our engineer immediate warning of any break, loose strand or other defect in the rope.

"We will have five alarm boxes from the eastern terminus of the line to Hyde street, and four from there to Central Avenue. When a strand is cut and comes loose, the gripman will at once tell the conductor, and he will run to the nearest alarm box. He will take a crank key provided him and constantly carried, and will unlock the box, when he will signal to the engineer, who will at once stop the engine, and the repairers will go out and fix the rope so that it may safely run again.

"We think these alarm boxes will be a very valuable addition to our cable system. They will certainly save much vexatious delay in the repair of cables, and will give us a much better service all around, to say nothing of the safeguard against accident." Mr. Harris explained that the chief cause of the trouble on Tuesday morning last, when a car made a toboggan run down California street hill, was that the track was slippery. The track and wheel brakes acted all right, but the wheels were lifted from the track by the application of the wooden brakes resting on the rails. The brakes were so greasy and the tracks were so wet that the car slid rapidly down the hill. On reaching Kearny street, where the track was sanded, the brakes held fast and the car was stopped.

"We are going to put a stop to all that sort of thing," said the superintendent. "We are having sand boxes built on each dummy, and they will be placed under each seat, with a pipe extending from them to the track. Whenever the rails are slippery, the gripman can easily sand them and make the brakes hold firmly."

Mr. Harris said that while the sand boxes were being constructed, the signalmen along the line will sand the track regularly during wet weather.

"We are beginning to put up the alarm boxes already," said he, "and will have them all in place soon."

The Humboldt Oil Fields.

A dispatch from Eureka, Humboldt Co., Cal., says: Word has been received from the scene of the oil prospecting near Garberville which gives a most encouraging view of the indications. Work was begun the 6th of February sinking a well ten inches in diameter. The earth was excavated to the depth of 21½ feet, where a sandstone ledge was struck.

Boring was then commenced, but several interruptions occurred from the breaking of the apparatus, which had to be transported a long distance to Scotia for repairs. This necessitated the duplication of most of the machinery, and since this has been done greater progress has been made.

The Humboldt Oil Land Company is prosecuting the work. They worked with only one shift of laborers till the 22d of February, when the force was doubled, and the operations are now proceeding night and day without cessation.

Saturday night the well had been sunk 300 feet, and yet the nature of the rock had not changed. Through this whole distance the substance is soft, oil-yielding sandstone. Superintendent Giffelin says the evenness of strata and the extent to which it is impregnated with oil is remarkable, and something beyond what he had ever seen. The oil is pumped out with the water, and so favorable are all the indications that those interested are becoming more confident, and the whole community feels greatly encouraged.

The walls of the well remain intact. Before the well reaches a depth of 400 feet the size of the bore will be changed from ten to eight inches, and at the 50-foot level to six inches.

THE HIGHEST RAILROAD BRIDGE in the United States is the K'nzua viaduct on the Erie, N. Y., railway—305 feet high.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

BELMONT.—*Ledger*, March 5: The ten-stamp mill at this mine is running steadily on surface ore. Several noted improvements have been made, the most prominent being a building, 30x50 feet, and horse-power hoist erected over the Boss shaft. The company will soon substitute steam, as the water is too strong for their present power.

MISCELLANEOUS.—The ten-stamp mill of the McAtto mine, near Wieland, is to be taken down and added to the Clinton Consolidated, which will give the latter a capacity of 30 stamps. The ore body at the present increased depth is said to warrant this enlargement. It is reported that the drift in the lower level of the Wildman encountered the ledge last week, 70 feet nearer than was anticipated. This encourages the hope that the ore body has widened out considerably at this depth. The rock is said to be of good quality, equal to any heretofore encountered. We earnestly hope the good news is true. The cleanup at the Mahoney mine last month is said to have been \$1000 better than the month previous. Rumors are afloat that the litigation between the English and American stockholders of the Amador gold mine has been settled, or rather that a basis of settlement has been agreed upon. The American company, it is claimed, will probably secure control and manage the concern, as soon as everything is settled. This will be cheering news for the creditors, as there is something like \$14,000 due to parties in Amador county, not to mention the outside debts, which amount to even more than this.

El Dorado.

By ELECTRICITY.—*Placer Republican*, March 2: Arrangements are being perfected to light and run the Idlewild mine, two and one-half miles from Greenwood, El Dorado county, by electricity. Three dynamos and the necessary machinery have arrived at this city for the above-mentioned purpose. The drills and all machinery will be run by electricity. It is claimed that they can mill all ore at the low cost of 40 cents per ton. This mine is familiarly known as the old Taylor mine. Electricity is now used in the St. Lawrence and Dalmatia mines.

VAN.—*Georgetown Gazette*, March 4: Only the pump on the Van mine is now running.

PLACERS.—The unusual amount of gold dust sold in town during the past week shows that placer mining is picking up.

DARLINO.—*El Dorado Republican*, March 3: The mill at the Darling mine was shut down temporarily a few days ago for the purpose of putting in concentrators. Crushing will be resumed as soon as this work is completed. The miners formerly employed in the Landecker mine, having filed liens on that property to secure wages due them, have commenced an action against the proprietors. J. B. Polk came down Friday from the Philadelphia and Gold Note mine. Mr. Polk exhibited some very rich ore from that mine and reports about 200 tons on the dump.

Mono.

BODIE CON.—*Bodie Miner*, March 4: Upraise No. 1, above the 500-foot level, Jupiter shaft, was extended 7 feet. The ore in this upraise is about 6 inches wide. We will start the mill on Bodie ore next week, or as soon as we get through cleaning up from Bulwer run.

Mono.—During the past week, north drift from No. 1 upraise, 100 feet above the 700-foot level, was extended 7 feet, and connection made with No. 2 upraise for air. The seam of ore in this drift is very good. Started to upraise in No. 1 and extended the same four feet; total distance from the 700-foot level, 110 feet. The seam of ore in the face is good but small.

Nevada.

ST. JOHN MINE.—*Grass Valley Union*, March 4: The work in the St. John mine, which has been steadily prosecuted for the past year or more under Superintendent T. H. Moore, has been making an encouraging showing for some time past, and the company is so well satisfied with the prospects that it has purchased the new mill on the Murchie mining property in the vicinity of Nevada City, which was erected some years ago, but was not operated for any great length of time. This mill has ten stamps, four Frue concentrators, steam machinery, and all the necessary fixtures. The work of removal and rebuilding will be commenced next month, and the mill will be set up a short distance below the St. John hoisting works, where the ground is favorable, and where there will be sufficient fall for ore shoots, rock breakers and self-feeders, which will ensure the convenient handling and cheap reduction of the ore. The shaft of the St. John mine has been sunk to a depth of 233 feet, from which a drift has been run 150 feet west on the vein, which now shows on the face a width of from six to eight feet. In all there have been 300 feet of drifts and crosscuts run, but no stopping has been done, as the quartz has been left to be taken down when the mill is ready. There are now on the dump 250 tons of quartz, which amount will be considerably increased by the time the stamps are ready to drop. All the quartz shows largely in sulphurets and galena, and prospects fairly in free gold, but it is not high-grade milling ore. The ledge is so large, however, and can be mined and milled so cheaply, that \$6 ore will be a paying proposition. The sulphurets give large assays, and are in such quantity that they will add materially to the bullion output of the mine. All appearances go to show that as depth in the mine is attained the vein will be more regular and its size maintained or increased, as it does

not, at present depth, entirely fill the fissure between the walls. The wall rocks are highly mineralized, which is an encouraging sign, and the belief is that the vein is in the same fissure as the Idaho mine, as the hanging wall rock is precisely of the same character. The stock of the St. John mine is largely owned in San Francisco, and a portion of the stock is also owned in Chicago and St. Louis. It will yet prove a great mine, unless all appearances are deceptive.

BULLION SHIPMENTS.—*Nevada Transcript*, March 3: The Citizens' Bank made a bullion shipment amounting to \$15,000 about the first of the week, and to-day they sent off another bar of the yellow stuff worth \$3000. The gold is the result of partial cleanups from mines in this district. This is the sort of fruit that Nevada county produces, and she has the whole world for a market. When the hydraulic mines are again running in full blast, there will be a great increase in the bullion shipments.

MINE PURCHASES.—*Grass Valley Telegraph*, March 4: For some months past the Nevada County Improvement Association has been working the Peabody mine under a lease. Recent developments in the mine have so encouraged the company that they have purchased the mine outright. A steam plant, consisting of hoisting and pumping machinery, will be put on the mine immediately, and it will be sufficient for all workings and will be the very best that money can buy.

ORLEANS.—A crushing of 14 loads of rock from the Orleans mine has just been put through the Rodgers' mill. The result was a yield of \$44 per load, which is \$7 ahead of the last crushing made. The ledge is looking well and work will be pushed ahead as fast as possible. The Rodgers' mill will soon begin the work of crushing ore from the Merrimac mine.

HERMOSA.—*Grass Valley Union*, March 4: The shaft of the Hermosa mine has reached a depth of 500 feet, and the directors have let contracts to run 50 feet each way to open up a new level. Upon the completion of these contracts, others will be let. If a pay shoot is struck, there will be extensive backs to be opened. The vein, as shown in the shaft, looks fairly well, and the company feels encouraged that in drifting something better will be found. The work in the mine has been diligently prosecuted, while the company has been kept on a sound financial basis all the time.

FAST MINING WORK.—*Grass Valley Union*, March 6: The *Union* of Thursday, in giving an item of the rapid progress made in sinking the shaft of the North Star mine, intended to say that 44 feet, 8 by 18 feet, had been sunk in one month, but the types got mixed and said 24 feet, but even those figures were not high enough, as Superintendent Abadie informs us, as the distance actually sunk from January 6th to February 6th, 110 single shifts working was 55 feet. He says the merit of the work is due to James Seymour, Thos. Tippet, W. C. Carter and Mr. McIvor. This, Mr. Abadie claims, is the best record in shaft-sinking that has been made in Nevada county, when taken in connection with the fact that all other underground work went on as usual, the 40 stamps being kept supplied with quartz raised from the mine.

SIGNIFICANT SALE.—*Tidings*, March 2: The Oro Flat mining claim at Boston Ravine, embraced within the Massachusetts Hill quartz mine, and believed to be one of the most valuable properties in the district, was sold by the Sheriff to-day to satisfy a judgment of \$36,003.91 and costs and interest. Mr. Whittaker Wright, a Philadelphia mining man, originally obtained the judgment, which he transferred to Charles Peyser of San Francisco, who in turn transferred it to L. Gilson, one of the principal owners of the Omaha & Lone Jack and Gold Hill mines of this district. Mr. Gilson to-day bid in the property for the amount of the judgment. The purchase by him is regarded as very significant.

BRUNSWICK.—*Tidings*, March 2: Supt. Fitzgerald reports renewed improvement in the ledge in the Brunswick shaft. He says the ore is the best the present company has found. A new and likely-looking ledge has been cut in the 400 level of the North Banner mine, in the hanging wall. It will require a few days to ascertain its value.

WYOMING CON. M. Co.—The directors of this company organized Wednesday evening by electing B. F. Rannels as President and W. E. Parsons as Secretary. The Citizens' Bank was made Treasurer. It was resolved to let a contract to sink the incline 50 feet. Fifty feet is about the present perpendicular depth. The water will be out by Monday and the mine opened to inspection by persons contemplating bidding for the contract.

KING SOLOMON'S MINES.—Operations on the King Solomon's group of mines near the Delhi have been in progress throughout the winter and tunnels have been advanced. Some specimens of the ore cut lately have been brought here. They show well in free gold and other likely mineral. Development is alone necessary to open up one of the biggest mining properties in the State.

GOON CRUSHING.—*Grass Valley Telegraph*, March 8: A crushing of 13 loads of ore from the Lafayette mine was completed at Joe Southern's mill on Monday. The result was a yield of 39 ounces of retorted gold and \$6 over. This does not include the sulphurets, which are rich. The gold from the mine is worth \$161 per ounce. The last crushing came from the tunnel where it taps the ledge at a depth of about 200 feet from the surface. The Lafayette is easily worked, and all of the crushings taken out have yielded most satisfactorily.

GRANITEVILLE.—*Nevada Transcript*: Myer & McPherson own the Blue Cloud, adjoining the Rocky Glen. They have been running a tunnel all winter, and have good rock, worth \$14 per ton.—Philip Hipert has good prospects in the "Old Dillon," adjoining the rocky Glen on

the south, the rock taken out going \$7 50 per ton.—Mr. Shepp has a good vein adjoining the Dillon, his last crushing paying \$52 per ton.—Parsons & Maybanks have some good properties, but for want of capital they are now lying idle.—The Ozali Brothers have been running a tunnel all winter, and have just cut a three-foot vein which shows free gold.—John Hipert and son will resume work on the old Liberty mine, but will have some hazardous work in tapping a very large body of water under sixty-five feet head.—Thomas staples and his boys are ground-slucing on Poorman's creek.

Placer.

ABOUT WASTE DUMPS.—*Herald*, March 5: Hawkins and Monahan have made another crushing of rock which they sorted out from the Eclipse waste dump and this time they realized about \$30 a ton. Their previous crushing from the same source yielded \$63 a ton. B. F. Hartley, who has a Hunter mill running on rock assorted from the waste dump at the old Crater mine is doing so well, we understand, that he proposes as soon as he can get at it, to duplicate his plant. The fact that these waste dumps are yielding so well is proof that the mines have been operated carelessly or that there is something radically wrong with our system of mining.

Plumas.

GREEN MOUNTAIN.—*Plumas Co. Bulletin*, March 3: W. N. Goodwin and S. W. Cheyney visited the Green Mountain mine Monday, returning here Tuesday. In the face of No. 6 tunnel a fine body of quartz is reported. Twenty stamps of the mill are now running. The mine is getting into good condition as fast as possible. An enormous amount of work has been done, and at small cost. A new tunnel has been driven around the Blake chute, in tunnel No. 5. The work of opening up this level will be pushed with all possible speed. The visitors were much elated over the prospects of the mine, whose possibilities as a mining proposition are rarely equaled.

EAST BRANCH.—*Plumas National*, March 6: Mr. R. Beldon, who was up from the East Branch Friday, gives us the following news: Mitchell & Beatty, on Willow Bar, will start their elevator in a few days. They have a good mine and have taken out considerable money. Odneal and Beldon, who have a quartz location on Mill creek, will resume work in a short time in their lower tunnel. By running about 100 feet farther, they think the ledge can be tapped at considerable depth.

THISTLE SHAFT.—Eighty men are now employed by the company. Four shifts of men are being worked.

LA PORTE.—The plentiful supply of water will enable those engaged in ground slucing at La Porte to secure quite healthy cleanups.

Sacramento.

PROSPECTING AT FOLSOM.—*Grass Valley Telegraph*, March 8: John T. Cardwell is prospecting for gold in gravel on the flat opposite the town of Folsom, Sacramento county. He is boring holes so as to ascertain the lay of the body of gravel, and when he finds out about that he will run in a tunnel, through which the gravel will be taken. It will require very many borings to give the knowledge sought for. It is a good idea, that of drilling into such ground before sinking expensive shafts or driving costly tunnels.

San Diego.

JULIAN AND BANNER.—*Sentinel*, March 3: Two more consignments of pipe passed through Julian the past week en-route for the Ready Relief mine at Banner. The water system for which this pipe is intended is developed at an altitude of 800 feet above the mill where it is to be used, and falls through a six inch pipe for a distance, then is contracted to a five inch pipe and at the exit comes out of a three-quarter inch hole against the buckets of the wheel with the force of a cannon ball.

The new boiler at the Helvetia has been put in place and fires were started under it Monday in order to dry out the masonry. A few days will suffice to complete the work, when the stamp mill will again be put in operation. A large amount of ore is on top awaiting the stamps, while great bodies of good ore are in sight below.

The Ruby Co. has been uncovering some very fine ore within the past few days in the old Wilcox mine. The vein averages eight inches in width and is holding up well. This company now works 14 men.

The engine and new hoister for the Cincinnati Bell was hauled up Saturday and will be placed in position at once. This valuable property will then be in better shape than ever to show up its vast resources.

James Courtney and Mike Flatley are still at work on the Padlock.

Shasta.

LADY MINING EXPERTS.—*Shasta Co. Democrat*, March 2: The miners of Old Diggings were treated to quite a novelty the latter part of last week. It was the visit of three ladies to that locality, who were there to expert some mining property which they contemplated purchasing. One of these ladies, Mrs. Newlands, is the sole owner and operator of three mines, in one of which she is now working 200 men. She is considered as being one of the safest mining experts in the business.

THE NEW RENOVATION PLANT.—*Shasta Co. Democrat*, March 2: Mr. Patrick Marley of Idaho, in company with Geo. Yount, and his two brothers of Napa county, and Thos. B. Dozier Esq. of this city, have formed a co-partnership for the erection and running of a roasting and chlorinating plant in the South Fork mining district. The company is styled the South Fork Milling Company, and it proposes to do custom work for the miners in South Fork district. Mr. Marley is an experienced man in his business. He has a patent on a new roasting furnace, which he

claims will produce better results on all classes of refractory ores than any other furnace now in use. Mr. Geo. Yount is an experienced assayer and millman, and the two working for the success of this enterprise will undoubtedly make it a success. The plant will have a capacity of reducing 12 tons every 24 hours, and the company expects to have it running inside of 90 days. A large force of men was put to work last Friday excavating for the plant. We have implicit faith that Mr. Marley will work the silver ores of South Fork district up to a high per cent, and we believe he is the man the miners of this country have been looking for years. We were over in South Fork two days last week, and to say that we were surprised at the prospective mineral output in that camp hardly expresses it. If this plant handles the ore successfully it will develop a silver camp second to none on the coast. We saw richer prospects, more of them and more high grade ore than we ever saw before in any district we have visited, and we predict that in a very few months South Fork will boom as never any camp in this part of the State boomed before.

Yuba.

SMARTSVILLE.—*Grass Valley Tidings*: The old Wheaton mine at Smartsville has been closed down for the present, and about 45 men are out of employment. A slide of earth falling on the machinery was the cause of stopping the work.

PERSISTENT PROSPECTORS.—*Grass Valley Tidings*, March 2: Messrs. German, Trood, Crall, Radford and others of North San Juan and Bloomfield, owners of the Orient drift gravel mine above Camptonville, expect to cut the channel in a few weeks. They have been prospecting for 12 years, and steadily for the last four years. One tunnel was run in 1100 feet and was found to be too high; then a shaft was put down, and now a tunnel lower down is in 1050 feet. Prospects of gravel obtained are full of promise of a rich reward when the channel is cut. It is believed by many that the channel is identical with that of the rich Bald Mountain Extension.

NEVADA.

Washoe District.

ON THE LONE.—*Virginia Enterprise*, March 3: There are no marked developments to report at any point on the lone at present. The usual drifting and crosscutting is going on at both ends, but there are no indications of anything important in the way of an ore body on the boards just now. The joint Sierra Nevada and Union west drift is out something over 1700 feet west of the shaft and is being pushed farther in that direction all the time. The north drift from the Kenosha tunnel in Sierra Nevada ground is being advanced steadily northward. Both drifts are in porphyry. In the South End group of mines fair grade ore is still being taken from the upraise from the 1300 level of the Belcher, and the recently started north drift from the bottom of the raise is encountering bunches and streaks of good ore. Bunches of rich ore are being developed in the raise from the 650 of the New York also. The joint Savage and Gould & Curry north drift is heading for ground where there is a likelihood of an ore body being developed. The point is some distance ahead yet, but there is an opportunity for a development of ore in the middle ground. There are stringers of quartz in the face at present. Following is the official report of the pumping operations in the Crown Point incline for the week ending Feb. 27, 1892: The 1700 station pumps have been working continuously during the week, the flow of water being about the same as at last report. The work of cleaning out the 1700 south drift is making good progress and is now opened out 650 feet from the station. The pumps are running now simply to keep the water below the station until 1700 south drift is cleaned out. The compressed air power is not sufficient to run the station and sinking pumps at the same time. It is necessary, therefore, to replace the compressed air by steam in the operation of the station pumps in order to reduce the water below this point.

OVERMAN.—Extracted from 1000 and 1100 levels 365 tons of ore. Car samples average \$20.17 per ton. Shipped to Brunswick mill 369 tons of ore. The average battery assay was \$16.06 per ton.

ALTA.—We commenced tanking water on the 21st inst., and have continued uninterrupted ever since. The water stands this morning 35 feet below the 1350 station, and if we meet with no serious setback, will reach the 1550 pump in ten days, when the necessary repairs can be made quickly and pumping resumed.

BELCHER.—The north drift from the bottom of the raise, 300 level, has been advanced 33 feet during the week, and is now out a total distance of 104 feet; face in porphyry with streaks of quartz through it yielding low assays. We are still working north from the 1300 level stope, and are now out ten feet on the 6th floor; face in quartz containing spots and bunches of good ore. Shipped to the Vivian mill during the week for reduction 154 tons 854 pounds of ore, the average battery assay of which was \$22.93.

KENTUCK.—The north drift from the Crown Point west crosscut, 160 level, was advanced 21 feet since last reports, and is now out a total distance of 113 feet; face in porphyry with small streaks of quartz running through it containing some fair-grade ore.

SEG. BELCHER.—The south lateral drift, 1300 level, has been repaired for a distance of 100 feet during the week, and there is still about 50 feet left to retimber before reaching the south line.

CROWN POINT.—The raise from the south drift from No. 3 east crosscut, 500 level, has been extended 31 feet during the week, and is now up 127 feet; top in a mixture of low

grade quartz and porphyry, with a little water running from it. The south drift from the west crosscut, 600 level, was advanced eight feet during the week, making its total length 85 feet, and stopped in porphyry. At a distance of 75 feet in a west crosscut was started from it, which is now out 16 feet; face in porphyry.

IMPERIAL.—We are taking out some ore from the old fillings on the upper levels.

YELLOW JACKET.—Shipping 50 tons of ore per day to the Brunswick mill.

CONFIDENCE-CHALLENGE.—The joint Confidence-Challenge west crosscut from the north drift, 200 level, is out 74 feet, 23 feet having been made during the week; face in quartz and porphyry. The joint Confidence and Challenge east crosscut, 300 level, is out 64 feet, 24 feet having been made during the week; face in porphyry.

JUSTICE.—The west drift, 490 level, was advanced 15 feet during the week, and is now out a total distance of 670 feet; face in porphyry. The north raise, 322 level, was advanced 12 feet during the week, making its total height 117 feet; top in porphyry streaked with quartz.

HALE AND NORCROSS.—On the 900 level of the north upraise, 32 feet south of our north boundary, is now up a total distance of 50 feet, and continues in quartz giving low assays. From the south upraise from this level we are extracting some fair-grade ore from and above the 6th floor. On the 1630 level we have temporarily discontinued work in west crosscut No. 2. West crosscut No. 3, started from the face of the north drift, is advanced 20 feet in low-grade quartz. We are doing considerable prospecting in different parts of the mine. There is no change of any importance in any of the drifts or crosscuts of the mine. During the week we have hoisted 415 cars of ore from the 900, 1100 and 1450 levels; average battery assay, \$23.37. Bullion yield for the week, \$6875.

SAVAJE.—During the week we have hoisted 811 cars of ore from the 750, 950, 1150, 1400, and 1500 levels; shipped to the Nevada mill 6324 tons; milled 632 tons; average battery assay, \$20.50. Bullion yield for the week, \$9895. On the Sinto Tunnel level, the joint west drift with the Gould and Curry Company was advanced 17 feet, making its total 190 feet; face in porphyry and stringers of quartz giving low assays.

SCORPION.—Since we resumed work from the joint drift from the 900 level of the Union shaft the drift has been advanced 40 feet, making its total 702 feet. The course of the drift is now 45 degrees west of north.

Wild Rose District.

IN START UP HIS MILL.—*Silver State*, March 3: Nick Frayer, the irrepressible, will start up the Cliff mill about the 15th of this month. The first run will be made on ore from the Bullion mine, the leasers of that mine having about 400 tons of high-grade ore on the dump. The mill has a capacity of about 20 tons daily, and as it has both concentrators and pans the ore is worked to a very high percentage. The Cliff mine is looking fine, and regular shipments of concentrates from Spring City will undoubtedly soon be made, reminding one of the times when the famous Paradise mine was at the zenith of its productiveness.

Tuscarora District.

BELLE ISLE.—*Times-Review*, March 4: The crosscut from No. 1 vein, 350-foot level, extended 11 feet. North intermediate drift on No. 3 below the 350, extended 10 feet. South drift, same place, extended 10 feet. The crosscut from No. 1 upraise extended 15 feet. Hoisted 9 cars second-class ore.

NORTH BELLE ISLE.—East crosscut south, 400-foot level, extended 2 feet. West crosscut, north end of No. 3 drift, same level, extended 10 feet. North intermediate above the 500 foot level extended 17 feet; still in good ore. No. 4 drift south, 500-foot level, extended 18 feet. Hoisted 42 cars concentrating ore.

NORTH COMMONWEALTH.—Second level—East drift from winze advanced 10 feet, producing 21 cars of ore, assay \$45 per ton. No. 1 raise from north intermediate drift put up 33 feet, top in vein matter.

DEL MONTE.—Second level—Joint raise stopes produced 10 tons first-class ore, assay value \$275 per ton. West drift from south line extended 35 feet.

NEVADA QUEEN.—Second level—No. 1 and 2 ore chutes have been placed in No. 1 south drift, and No. 3 raise put up 14 feet through very hard porphyry. It is better breaking in the top; about 10 feet to the vein.

ARIZONA.

HARQUA HALLA.—*Prescott Courier*, March 4: J. W. Cover and J. D. Helm returned from Harqua Halla yesterday, and from them the *Courier* learns that during their visit to the Bonanza mine a gold bar was cast weighing 3224 pounds, avoirdupois, valued at \$82,000, the product of a 42-days' run of the Bonanza mill. The shipment preceding this one was a 172-pound bar. The former is certainly the largest bar of gold ever cast on the Pacific Coast, or probably in the United States, the next largest known being one of \$70,000, in California. [The *Courier* is misinformed. Several larger bars than this have been made. The Spring Valley gold mine, Cherokee Flat, Butte county, Cal., made one valued at \$90,000 some years ago. One was made at Helena, Montana, a few years since valued at \$100,000. It came from the product of three mines. The biggest ever made was that of the North Bloomfield gravel mine, Nevada county, California, in 1882. It weighed 5113 pounds troy, and its value was \$114,000—not \$70,000, as the *Courier* states. This was from a single cleanup of the North Bloomfield mine, which that year yielded \$1,000,000 in gold.—*Ensign Press*.] These heavy bars are made to avoid risk of robbery by highwaymen. During seven and one-half months the mill has produced \$320,000. This mine bids fair to equal the famous Vulture mine, which

it closely resembles in character of ore and in the nature of the deposit. The owners are Hubbard & Bowers. The entire management is under the entire supervision of Mr. Hubbard, who, with his thorough knowledge of mining and milling and rare business ability, has reduced the cost of production to a minimum. There are 2000 tons of ore broken in the mine, and enough blocked out and in sight to run the mill six months. Arizona now has the largest and best paying gold mine on the Pacific Coast.

THE SENATOR.—*Journal*: The Senator mill and mine are running day and night shifts. About 40 men are employed in the mine at present. Only ten stamps of the mill are running yet, but the other ten will be started up in a few days, when the force in the mine will be increased. T. A. Conlee, who is working the Johnson mine at Stanton, came in recently, bringing samples of ore with him. The mine is opened up by a tunnel on the ledge for a distance of 200 feet. The vein is six feet between walls, both of which are well-defined. It carries from 14 to 3 feet of high-grade gold sulphurets, the balance of the vein being free-milling ore, which will mill from \$8 to \$10 per ton. Mr. Conlee is well satisfied with the property as far as developed, and will leave for the East soon to purchase a mill to work the ore. W. W. Vanderbilt visited Lynx creek, and says that Supt. Messicks and his assistant, Mr. Swan, started the Lynx Creek Hydraulic Works with a full head of water. Both giants were put at work washing down the mineral-bearing gravel beds, owned by the company. Twenty men are employed under the superintendence of an experienced hydraulic engineer. The reservoir has been built up during the past summer, and its capacity increased to about four times what it previously was.

DAKOTA.

SOLD SOME PROPERTY.—*Deadwood Pioneer*, March 5: William Quigley, of Big Bottom valley, arrived in Deadwood yesterday morning, spent the day here, and went home in the evening possessed of \$15,000 more ready money than he had on reaching Deadwood. The cash was acquired by transfer of his interest in the May and Custer lodes, adjoining the Big Missouri property, to the Big Missouri Company. Henry Robinson, of this city, is said to have also realized \$8000 by parting with his holdings in the same claims. Messrs. Baxter and Coffin's interests will probably be transferred to the company in a few days.

BOUGHT SOME GROUND.—A deal was closed up late Monday night, by which J. G. Keith's half interest in the Katie and Annie lodes was transferred to the Keystone Chlorination Company, which already owned the other half of the property. The purchase price has not been definitely stated, different rumors placing it at from \$25,000 to \$50,000. Keith acquired his interest only a short time ago, and turns a pretty penny by the deal, whether the greater or lesser sum was paid. The property is well developed and shows an immense body of \$35 gold ore, that is now being treated at the Keystone chlorination works, Garden City. It is currently reported that the money obtained on mortgage by the Golden Reward Company a few days ago, will be partly used in purchase of the Tony and Lundt group, the property owned by the Isadora Mining Company, at Bald Mountain. The Tony and Lundt property is now owned by a syndicate, willing to transfer it to the company for a very reasonable advance on the \$85,000 paid for the mines a few months ago. A handsome gold brick valued at \$14,000 was brought from the Golden Reward chlorination works, and deposited in the Deadwood National Bank last evening. The brick was the result of operations for last half of the short month of February.

IDAHO.

"AS RICH AS BLAZES!"—*Silver City Avalanche*, Feb. 27: Rumors were flying around town Thursday that an enormously rich strike had been made in the Phillips & Sullivan mine, and the mining reporter interviewed Mr. Phillips in regard to the same. He said in substance: "The Belfast crosscut, which we have run some 620 feet, has cut the vein, and although we have run 14 feet across the same, have not yet found the hanging wall. This strike is about 100 feet deeper and 30 feet south of the point where we had worked above, making a large block of rich ore to work out. The vein lies between porphyry walls and is mixed with a talc similar to that found above. I brought down samples yesterday for assay, which will be made to-day, but not in time to give results in to-day's issue. I prospected some of the rock a few days, which run high in gold. The mine looks better to-day than ever, and I am sorry we ever gave a bond on it." Next week, the width of the vein will be ascertained and the value of the same known.

BLAINE TUNNEL.—Work goes on with a monotonous regularity, and an average of eight feet every 24 hours is made. The main difficulty is in keeping the waste rock away from the air drills, as the tunnel is of such large dimensions. The large cars and double track alone makes it possible.

FLORIDA.—Harry Sullivan, John Herndon and Barney Matteson are still pounding away at their property on this mountain, and as soon as the roads are opened, will have another lot of ore milled. This is a new discovery, but a test run of about 25 tons, which was just made before the roads were blockaded, showed they had ore which would furnish the owners with a World's Fair stake.

MONTANA.

BUTTE NOTES.—*Montana Mining Journal*, March 2: Nuss, Sullivan & Co. are doing good work on the Mountain Chief, and will make a

cleanp sure.—John McCrimmon & Co. have taken a ledge on the Cora mine east of the Lexington and are taking out some good ore.—Desautel & Heinze are taking a vast quantity of good copper ore from the Ramsdell-Parrot, on which they have a lease.—The shaft of the Ophir, south of the city, has reached a depth of 250 feet. Ore is being extracted from the upper workings however, while the work of exploration is in progress below.—The Belle of Butte, at Walkerville, from which the silver Bow mill has been getting its supply of ore, has been closed down but the mill is kept running on ore from the Orphan Girl, on which the company is now working.—Colonel J. O. Hindnutt is working the Czarina, and is getting some 150-ounce rock from the vein, which is from two and a half to four feet in width.

BOULDER DISTRICT.—*Montana Mining Journal*, March 2: Dr. Johnson returned yesterday from a visit to the Mountain Key above St. Louis in Jefferson county. The crosscut tunnel is in 94 feet and will soon reach the vein. High-grade ore is being sacked from the shaft and a shipment will soon be made. Sinking in the Champion is going on as rapidly as possible, although the anticipated headway is not being made. Frank Finney has 20 inches of fine galena and carbonate in the bottom of a 20-foot shaft on the Siota mine, Amazon district. The property is a very promising one. Hines, Walters and DeLodge are getting ready to place machinery for development purposes on the North Boulder lode, North Boulder district. The claim is a very promising one, and will likely pass into the hands of capitalists at a handsome figure. Parties prospecting on a claim in Amazon district, near the smelter and between the railroad tracks, are said to have a foot of solid galena at a depth of only 15 or 20 feet.

SUSPENDED MINES.—*Inter-Mountain*, March 5: Notwithstanding it has been repeatedly stated, by what was supposed to be good authority, that there was nothing new in the situation at the Moulton, it now transpires that half the stamps in the Moulton mill have been hung up for about a week for want of ore. The Moulton is a 40-stamp mill, and depends largely upon custom ores for its continued operation. The lessees who have been furnishing the mill with ore have refused to longer sell at the present price of silver, hence the shut-down. It is said that only ten men have yet been laid off, but that the entire force will be discharged and the remaining 20 stamps hung up in the near future unless the company can secure sufficient ore to keep the entire plant running. The Four Johns mine, which adjoins the Black Rock, was closed down Monday by Loeber & Nickel on account, so says Judge Loeber, of the low price of silver. Twenty men were laid off at the Vulcan mine Monday night, the reason given being that the low price of silver would not justify the working of a full force.

SUNNAY NOTES.—*Inter-Mountain*, March 5: Hoisting machinery is being placed on the Snohomish by the Butte Copper Co. Nuss, Sullivan & Co. are doing good work on the Mountain Chief, and will make a cleanp sure. Fifty-eight bars of bullion of an estimated value of \$82,000 were shipped by the two express companies during the week. Desautel & Heinze are taking a vast quantity of good copper ore from the Ramsdell-Parrot, on which they have a lease. The Anaconda Co. is pumping water from the North Star mine near Walkerville for use at its various hoisting works.

DRY WIND.—*Montana Mining Journal*, March 5: Work is steadily progressing on the Cleopatra group. Ed Moore is working on the Bullion Queen, running a tunnel on a ten-inch seam of solid lead ore, which runs high in silver. One very important strike has been made on the Blue lead by Nelson Jensen. He struck the lead in his crosscut tunnel at 160 feet in depth. The vein is 16 feet wide and will pay in free gold. J. B. Williams is working on his new discovery, the Flint lode, which, although a fine showing, is rightly named, for the rock is as hard as his own quartzite pie crust.

NEW MEXICO.

STEEPLE ROCK REDIVIVUS.—*Southwest Sentinel*, March 4: For some time past, rumors of the sale of the Jim Crow and Imperial mining properties have been rife in the community, and, as is well known, a few of our nifty young men, including Charles I. Davenport, R. P. Barnes, Allan H. Macdonald, J. E. Hussy, A. H. Nichol and W. C. Davenport, have been working the property under a lease and bond from the owners—R. T. Bailey, H. C. Boone, B. B. Adams and D. Boone. It now transpires that under an arrangement with the lessees, J. M. Wright, Esq., and Prof. W. Geo. Waring of this city have been working up a sale, and have succeeded in placing the property with a wealthy Pittsburg syndicate for the sum of \$150,000, besides a stock interest retained by the two promoters. If the chute of ore which has continued from the grass roots to the bottom and through every part of the workings of the mine shall prove permanent, a half million dollars is a small price for the property. The mine stood the test of the most rigid examination and survey and a complete sampling and analysis of its ores, and had a smaller strike been made in Creede Camp or Cripple creek at the same time the Jim Crow was discovered, a busy city of 10,000 people would now be engaged in developing the resources of the camp. We have noticed that when a strike is made in Colorado, it is advertised in such a way as leads to the exploration of the entire region round about; but in Grant county if a man sells a mine for a few thousand dollars, he is called a "lucky dog," a "shrewd fellow," etc., the idea being that anything you get for a mine or prospect is clear gain, regardless of the fact that the development of our millions of gold and silver constitutes almost our only means of progress. We think that of all laborers none is more worthy of his hire than the miner, the

prospector, the promoter. We believe our mines are as good as those of Colorado or any other State or country. All they need is fair play, and we are pleased to learn that the Imperial, Jim Crow property, is to be developed by the most improved mining methods.

TALL PINE.—*Cor. Silver City Enterprise*: Owing to an abundance of water in the gulches in the immediate vicinity, a large number of Mexicans and several gentlemen of leisure have been doing very well "rocking" to the tune of—well, enough to buy grub with and more too. The Bell & Stephens mill has been running on ore from the Santa Rosalia, formerly the Golden Rule mine.

A number of new mining ventures are talked of, which, if started, will help to improve the camp, more of which anon.

The Pinos Altos amalgamator owned by Long & Robbins is doing good work on the tailings from Bell & Stephens' mill. It has only been running about twenty-four hours, and is saving 97 per cent of whatever gold escapes from the vanners. Mr. Long, the inventor, informs me that, with some few improvements, which will be made, he is sure of making his machine a grand success;

OREGON.

NEW MILL.—*Seattle Mining News*, March 3: The new custom mill to be erected at Ruby city is now an assured fact. The Washington Reduction Co. has secured a site for the mill at the south end of town, near the large tunnel into the Ruby mountain, and has agreed to have 40 stamps ready to run by July 1st. This was the one thing needed to assure the rapid development and consequent prosperity of the mining and all other interests of that rich district.

THE MINING OUTLOOK.—*Ellensburg Capital*, March 3: The season of 1892 promises to be a very prosperous one for the mines of this State, and it is probable that the greatest advances will be made in all directions. While we are interested in the development of mines all over the State, which means general prosperity, we are more particularly interested in those at home, which are daily becoming more favorably known and which are attracting outside capital and energy. The heavy fall of snow in the mountains this winter insures plenty of water, which is so essential to the prosecution of successful mining, and as soon as the season opens a great deal of work will be commenced on the Swauk and Peshastin districts, than which no richer regions are now known in the State. Already inquiries are being made in regard to properties there. There is already one mill in the Peshastin and it is likely that one or more will be working on the Swauk before the summer is over. Capital is needed and a splendid income awaits the parties who will put up the mills. A great deal of placer mining will be done as heretofore, and there will be much more prospecting done than ever before. Our county should and no doubt will be known in the near future as the banner mineral producer of the State.

UTAH.

STRIKE IN THE MEEARS.—*Park Record*, March 5: It now transpires that the strike of 18 inches of ore, reported in the Mearns shaft last week while cutting a station on the 500 level, was correct, in spite of the strenuous denial at headquarters. It seems, however, that the denial was based on the fact that the ore was not in the shaft exactly, but a few feet from it, and that the local superintendent didn't know whether Mr. Mearns wanted the news to reach the outside world or not. The *Record* was positive its information was correct, but, through courtesy, did not like to say so. Everybody knows what the Mearns and the Daly West are after, and knows it is only a matter of time until it is found, and as the ground is all patented and belongs to strong companies, it is hard to understand the necessity for trying to always mislead the public.

LEASED THE CREOLE No. 2.—Martin McGrath and associates have leased the Creole No. 2 from E. W. Berry, D. F. Condon and M. S. Ascheim, and will soon commence development work on the same through the shaft they have sunk on the Typo. The actions of Mr. McGrath would indicate that a good body of ore has been found in the Typo, though the soft impeachment is denied. The fact that a controlling interest has recently been purchased in this property, and a lease on the Creole No. 2, which adjoins it on the northwest, certainly looks as if there was method in the manipulation and that something besides indications was at the bottom of the transactions.

NO PERCEPTIBLE EFFECT.—When the large volume of water was first encountered in the big Ontario drain tunnel, it was thought the large scope of mining ground to the east and south would certainly be drained of water, but to date, though the flow in the tunnel has held its own, there has been no diminution in the quantity of water found in the district mentioned, and the relief anticipated is yet to come if it comes at all. There are undoubtedly some big mines in that part of Blue Ledge, if depth could only be obtained, but the water still prohibits sinking and tunnels are the only method by which the country can be developed.

ORE AND BULLION.—The Marsac mill shipped nine bars of bullion this week valued at something over \$11,989. The ounces were not stated. Ore hauling was commenced again to-day from the Anchor mine and Union concentrator, but the roads are so bad only light loads can be hauled. The ore shipments this week were confined entirely to the Mayflower, which sent to the market over 988,000 pounds. The Woodside canyon road is the only one now open and it is in a tough condition.

MECHANICAL PROGRESS.

A TRIBUTE TO AMERICA.—Our cousins across the water are becoming more and more appreciative of the skill and energy of American mechanics. The recent interchange of visits between the iron workers of the two countries has had a most beneficial effect. Englishmen are free to acknowledge that they have gained much from becoming more thoroughly acquainted with our men and methods of work. No doubt, much has also been gained on our side; but, so far as the observation of the writer reaches, our people are not as ready to acknowledge the instruction gained by their visits to English shops, as is being done by English visits to our own. The extensive exhibits which will be made by Europeans and our own people at the forthcoming Exposition at Chicago will, no doubt, be an object lesson of great value, and one from which much of practical and mutual value will be derived. We have been led to these reflections by reading the subjoined paragraph from the *Iron Trade Circular* of London and several other similar paragraphs which lie before us as we write: "It is seemingly but a few years ago that we made all the rails that America needed. It was the Welsh rail which linked the Puritan North to the Cavalier States of the South; which crossed the great pampas and wastes, bringing the Mormon under control and helping to subdue the impetuous redskin, and bringing, we may add, the granaries of Chicago and the great industries of Pennsylvania as tributaries to European needs. What do we now make? Not a solitary rail goes from Wales to the States! * * * Ironmasters once thought that the Americans could not make steel rails. They have now beaten our record. We have dreamt that we only can make tin-plate; that there is something in the coal and iron we have different to others. This is only a dream. The shrewd American, a product of the keenest of every land—many expatriated for the fact that their quick brains were not under moral discipline—will be sure to meet home demand with home supplies."

EXPERIMENTS ON THE SOLUBILITY OF METALS.—The insolubility of pure metals in acids has been investigated by Dr. Weeren, a German chemist, who states that chemically pure zinc, as well as many other metals in a state of purity, are insoluble or only very slightly soluble in acids, because at the moment of their introduction into the acid they become surrounded by an atmosphere of condensed hydrogen, which, under normal circumstances, effectually protects the metal from further attacks on the part of the acid. In the experiments which established this conclusion, the amount of chemically pure zinc dissolved by the acid was first determined; it was next sought to ascertain what difference would follow by performing the experiment in vacuo, when, of course, the escape of hydrogen would be greatly facilitated; and under these circumstances the solubility was found to be increased sevenfold. In the final experiment, namely, to learn the effect of introducing into the acid a small quantity of an oxidizing agent capable of converting the hydrogen film to water, it was found that when a little chromic acid was thus introduced, the solubility was increased 175 times, and when hydrogen peroxide was employed, the solubility was increased three hundredfold.

ANOTHER NEW NAIL.—Improvements in nails are still in order. The latest "new nail" is a sort of combined screw and nail, but partakes most of the character of the last-named appliance. The nail is circular, and carries a screw thread, in the form of a very coarse spiral, only once traversing the circumference of the nail in the course of its entire length from head to point. This nail is inserted in the ordinary way, by the aid of a hammer. Its superiority in holding power will be admitted by any mechanic. Thus, if the new nail be driven through two pieces of wood, A and B, in the order named, it would be necessary, in order to tear B from A, that either the iron or the wood screw should be stripped, the other alternative—retrogression of the screwed nail—being practically impossible of occurrence.

A GOLD MEDAL FOR THE BEVINGTON WELDING PROCESS.—J. H. Bevington of Chicago has been awarded the Elliott Cresson gold medal by the Franklin Institute of Philadelphia for his new process for welding and spinning brass and other metals. This process was described in these columns some few weeks ago. It consists briefly in the welding of copper, brass, aluminum, iron and other metals, by forcing them into rapidly revolving dies, where they are softened by frictional heat and united end to end as

in ordinary welding, or forced into one homogeneous mass, as solid as if cast into one piece. Brass and copper may be thus welded, which has heretofore been considered impossible. By this process, tubes of all kinds and of any length or thickness can be readily formed, and the ends of short tubes be as neatly joined as if they had been made in one piece. This process is of wide application, and the patentee is meeting with the most flattering success in its introduction to practical use. The Franklin Institute evidently considers it an invention of great value, as it has never issued but three of the medals named during the past 30 years.

MAXIM OUTDONE.—A new quick-firing Winchester gun, which threatens to dissipate the renown gained by the Maxim gun in the rapidity of its death-dealing capacity, was recently tested at New Haven, Conn. The number of shots ejected per minute was 900. The Maxim machine gun holds the record up to 750 shots per minute. The new Winchester has a water jacket surrounding the barrel, that holds one gallon of water, which is evaporated in one minute when the gun is in operation. In experiments made without the water jacket, the barrel became too hot for safety in less than half a minute. The exploded shells, as they are thrown from the breech, rise about two feet over the gun, and fall in what appears to be a gracefully-curved bar of burnished brass. The gun is the invention of Messrs. Browning Brothers, gun makers, of Ogden, Utah.

CHANGES IN THE DENSITY OF NICKEL-STEEL.—The recent remarkable discovery by Professor Hopkinson of the changes in the density of nickel-steel (containing 22 per cent of nickel), which are produced by cooling to -30° , affords another instance of changes of structure through intense cold. This variety of steel is readily magnetizable when exposed to severe cold, but is not so at ordinary temperatures. Its density, moreover, is permanently reduced two per cent by the exposure to cold; and it is startling to contemplate the effect which would be produced by a visit to the Arctic regions of a ship of war built in a temperate climate, of ordinary steel, and clad with some 3000 tons of such nickel-steel armor. The shearing which would result from the expansion of armor by the exposure to cold would destroy the ship.

ANTIQUITY OF IRON WORK.—Wrought iron was largely used by the Greeks and Romans, and they seem also to have been acquainted with cast iron, although it was supposed to have been scarcely known to them until recent explorations established a different belief. But, as usually occurs when the relative antiquity of any product or device is the subject of debate, the Chinese come in to throw all competitors out of court. In this case, they are credited with having made use of wrought iron and steel 2000 years and cast iron 400 B. C. They built a bridge with cast-iron columns over a ravine 1000 feet deep in the first century of the Christian era.

GRATE SURFACE.—If the grate surface under a boiler is larger than is necessary to burn the required amount of coal, it is neither economy, convenience nor good judgment to retain the full surface, as better results, with less labor and more economy in fuel, would be obtained by shortening the grates to such an extent that from 8 inches to 12 inches of fire would be required at all times.

HOW TO SOFTEN CAST IRON.—To drill chilled shoes and plow points for riveting steel upon them, heat to a cherry red, keeping the work level in the fire; then with a pair of cold tongs, put on a piece of brimstone, a little less in size than the diameter of the hole which you wish to drill. This will soften the iron entirely through the casting. Let it lay on the fire until black, then lay away until cool, after which it can be easily drilled.

TESTING STEEL WIRE.—An ingenious method of testing the hardness of steel wire has been invented by a Swedish metallurgist. It is based upon the intensity of current necessary to fuse a wire of a standard size. By experiment, the current required to fuse standard wires of different degrees of hardness can be determined, and upon this basis, the quality of any sample can be ascertained.

CHEAPENING MACHINERY.—Pumping engines for city water works were a rare and costly luxury a few years ago. Now, owing to the reduced rates at which they can be afforded, they are within the reach of almost any small town.

SCIENTIFIC PROGRESS.

Telsa's Wonderful Electrical Experiments.

The scientists of two continents are just now largely interested in the wonderful series of experiments in which Mr. Nicola Telsa has been engaged for the past two years, which he first made known in an experimental lecture in New York about a year ago, and which has quite recently attracted still wider attention by his late lectures in London. These experiments relate mainly to the practical possibilities of electric induction, and alternating currents of great frequency and high potentials.

In these investigations, Mr. Telsa has opened up quite a new field of electrical research, and one which promises most important results, both theoretical and practical. While deeply interested in the former, from a scientific point of view, he is never unmindful of the latter, as involving principles of the highest service to mankind.

In our last issue we made some extended notice of the possibility of certain practical results, attainable from the more recent discoveries in connection with electrical induction. In the present issue, reference is made to the possibility, theoretical and practical, that may be derived from alternating currents.

THE MATTER OF RAPID ALTERNATION

Seems to have been much neglected by former students and experimenters, especially in regard to the phenomena observable in vacuum tubes. Great pains have been taken to secure high potentials, but very little attention has been paid to the rate of alternation or the rapidity with which the current vibrates to and fro. From Mr. Telsa's investigations, it appears that the latter is of great, if not of more, importance than the former. He has found that by increasing the rate of alternation to a very great extent above what has been heretofore attempted, most wonderful and quite unexpected phenomena are presented. Heretofore, the alternations have been confined to from 13,000 to 15,000 per second; but by a peculiarly-constructed dynamo, he has been enabled to raise the potential to quite a million volts.

One of the most important results developed by Mr. Telsa's experiments is the fact that alternate currents of extremely high frequency and potential are perfectly harmless in their effect on the human body. As a proof of this, Mr. Telsa receives a current of some 50,000 volts, without any inconvenience. This is in direct contradiction to the hitherto universally received theory that the higher the potential, the more deadly the effect.

An important conclusion, legitimately drawn from this phenomena, is that a close analogy exists between the physiological effects of heat and light vibrations and those of electricity—it depends upon the degree of velocity of these vibrations whether our senses perceive them as heat or light. Vibrations of lesser velocity are manifested as heat; those of a higher rate, as light.

May not this discovery help the scientist in elucidating some of the hitherto inexplicable phenomena connected with the theory of light?

The slower vibrations, or heat, are fatal to the human body, while the vibrations of greater velocity, light, are receptive and harmless. So the slower electric vibrations of say 2000 volts or more, will kill a man, while a current of 10 or 15 times that amount will not harm him providing the current (amperes) are reduced in the same ratio.

Mr. Telsa began his lecture before the Royal Institute by an experiment which consisted in taking in one hand a glass tube, exhausted of air and about four feet long. While holding this tube in one hand he connected the opposite hand with the terminal of a coil. The tube instantly became so luminous that when the gas was turned off it gave sufficient light for reading a newspaper. It was manifest that electro-magnetic radiations—not a direct current—were being conducted through his body to the tube, where those radiations put into active motion the few molecules of air left in the tube, which by their bombardment of each other, created the light observed, which was soft and much resembling mild sunlight.

Another effect of electric radiation was shown, as follows: Two zinc plates, one resting upon the floor and the other elevated ten feet above, each connected with the poles of a coil. An incandescent lamp bulb was placed midway between the two zinc plates, when instantly the exhausted lamp bulb be-

gan to glow brilliantly, without any connection with an electric current. The phenomena was similar to that of the tube, only the first was radiation passing from a coil through the body of the experimenter, while the other was radiation without any other conductor than the air itself, there being a distance of five feet from the bulb in either direction to a coil.

WHAT THESE EXPERIMENTS PORTEND.

He must be dull in the extreme who cannot discern from these experiments the possibility of important practical results, from the latter or radiation results, which may lead to a complete revolution in our present methods of illumination, whether by gas or electricity. If the rarified air in a tube or lamp bulb can be put into a luminous condition, why may we not hope to eventually render the air of a room equally sensitive to some condition of electric radiation? What other potentials may still lay hidden in this new and wonderful phenomena—who can tell?

Again, it requires no great stretch of the imagination to realize what immense importance may attach to that other phenomena of the varied rapidity of alternating currents which may be increased from 2000 or less in a second to a million or more. The wonderful modification which is thus effected in the action of the electric current on the human body is in the same line as were the Lauffen experiments in conducting electric energy, in a comparatively safe manner, between two widely distant points. It is a great comfort to know that we are becoming more and more experienced in the matter of more safely handling the electric current, and a great practical importance that we are constantly improving in our methods of transmitting its energy.

Telsa's experiments prove that we have more than one electrical "wizard" in America, and that the latest studies in electric radiation and induction give us great reason to believe that there are yet more and greater secrets to be uncovered and brought to the aid of man in his present wonderful researches into the great unknown.

A NEW FILAMENT FOR INCANDESCENT LAMPS.—Philip Hickley, of Evanston, Ill.; claims that incandescent lamp filaments possessing the desirable qualities of long life with the capability of high incandescence can be produced from the roots of certain plants belonging to the order of graminæ, and particularly of the species sativa, commonly known as "rice plant." This plant is a native of tropical countries, but has been introduced and cultivated extensively in higher latitudes, and a great many varieties are known. Mr. Hickley has experimented with the roots of a number of varieties of the rice plant, and among them he finds that the roots of that variety known as the "Italian" will produce excellent filaments. The root of this plant is of suitable size and length for filaments and requires but little shaping to prepare it for use. In its structure it is remarkably dense and free from pores. It possesses great toughness, combined with flexibility, permitting it to be readily shaped to the desired form without in the least injuring its texture. There is sufficient variation in the size of the roots to permit their being used for the various sizes of filaments.

PROGRESS IN CHEMICAL SCIENCE.—After several years of constant study and experiment, Prof. William Read, of Needham, Mass., has succeeded in producing a new chemical which is entirely akin to the various lines of alcohols now used for manufacturing purposes. This discovery, which is of a very startling nature, has placed upon the market a new alcohol which is superior to all others in solvent properties, especially in the manufacture of dyes, and which is much cheaper. The properties of the new spirit, and the results it produces are identical with those of the ordinary alcohols, except as above stated. A large corporation under the name of the Massachusetts Chemical Company, is erecting laboratories which are rapidly approaching completion, and which will be adequate to supply the demand for the new chemical.

THE MARVELS OF ASTRONOMY.—Look at the Pleiades with the unaided eye and you may see six or seven or a dozen stars; look at it through a three-inch telescope and you may perhaps see 300; study it through a telescope for three years, as M. Wolf has done, and map the stars and their places and you may record 600 to 700 stars on a strange background of nebulous light; expose a sensitive plate for an hour, and more than twice that number are revealed; lengthen the exposure to four hours and you have a picture of 2326 stars, with a different and more extensive background of nebulousity.

ELECTRICITY.

Electricity in Mines.

The following summing of what is now being done by electricity in mining questions is taken from a leading editorial in a late number of the *London Mining Journal*. It will no doubt be perused with much interest by our readers. We have taken the liberty to strike out a few paragraphs to bring it within the scope of these columns:

The problem of how to reduce the cost of working mines to a level at which other than exceptionally rich deposits may be profitably exploited, is unquestionably largely bound up with the progress of electrical engineering. It is, indeed, hardly too much to say that mining is destined in the future to become an appendage to the electrical industry, and the important position taken up in the present Exhibition at the Crystal Palace by appliances adapted to all the numerous purposes of mining and metallurgy is sufficient to show how much has already been done toward attaining this end. Mining engineers have, therefore, peculiar interest in the important advances which have of late been made in electrical science, advances which, in fact, place electricity upon a new basis in its practical application to the transmission of power.

The results obtained by the historical experiments in long distance transmission from Lauffen to Frankfurt suffice to show that the resources of electricity in this respect are practically illimitable, and the researches of M. Telsa and of other electricians afford substantial ground for believing that we shall before long witness an enormous reduction in the amount of power required to be expended in order to obtain sufficient electrical force to drive machines. The excessive strain upon machinery which was formerly necessary to produce powerful currents has already been so far lessened as to appreciably affect the cost of generating and transmitting electricity. This is but a typical example of the advances in electrical science that are bringing it nearer and nearer to general application in mining. The objection that was formerly entertained against the employment of electricity in mines through the danger of explosion in fiery workings, from the sparking of the commutators, can no longer be upheld, and another difficulty that arose from the depreciation of the delicate machinery by dust has been effectively overcome. In the best commutators there is no sparking whatever, and the simplicity which is being attained in the construction of electrical machinery has lessened considerably its liability to be affected by the dust. Indeed, there is reason to believe that, compared with steam, electricity already possess advantages besides that of cheapness, under circumstances that were formerly considered to present the greatest impediments to its employment. Where cheap motive power can be obtained for driving the dynamos, and where it is found necessary to convey the power over long distances, there is no question whatever that electricity is the best force available for mining purposes. The conveyance of power by bands and pulleys is wasteful and inefficient, and compressed air does not, in all respects, fulfill the purposes that were at one time claimed for it. A great loss is certainly experienced in the conveyance of electrical power over distances of any magnitude, but that loss is rarely so much as 50 per cent, and at this point electricity is considerably cheaper, besides being more convenient, than any other power.

ELECTRICAL TRANSMISSION OF POWER.

It is evident that where water power is available, electrical transmission must furnish a most valuable aid to the mineral development of a district. The Frankfurt experiment has conclusively demonstrated that its capabilities in this direction are of the very widest range, and it is quite impossible to say how largely they may assist in opening up metalliferous wealth, which could hardly be worked if it were necessary to carry fuel to the mines. Moreover, even where water power is not available—and there are comparatively few districts where a river or water course cannot be turned to some account—electricity is the most economical and efficient agent that can be employed for driving mining machinery. This seems to be a growing conviction among mining engineers, who are coming to regard electricity as an established factor in their operations. Electricity has no longer the limited scope which it formally possessed, but it is now applied to every process of mining, and extensive plants are being laid down not only in this country but in Amer-

ica and on the Continent. A striking instance of the way in which the electrical engineer has overcome mechanical difficulties is afforded by the successful pumping operations at St. John's Colliery, Normanston. This instance is quoted by the Earl of Albermarle, who says that the plant was required to cope with a salt water feeder of 5100 gallons an hour, at a vertical depth of 900 feet below the surface of the ground. The pressure on the ram faces was so much—400 lbs. to the square inch—that very specially designed pumps were required. These difficulties were successfully overcome, and the electrical plant laid down is now raising 125,000 gallons a day. The efficiency of this plant is about 50 per cent. Considerable difficulties, too, have had to be met with in the designing of locomotives for mines, since the excessive wear and tear to which they are subjected would seem to render electricity an imperfect agent. But, as in everything else in which electricity is the motive power, the progress of electrical science has overcome these obstacles. Upon the Continent, attention is being particularly given to this method of transport, and several types of locomotive have given satisfactory results. Among these, prominence must be given to one where the current is taken off a copper wire fixed to the roof of the gallery by means of a light metal frame which rubs along the wire. The return circuit is through the rails. Again an engine is being constructed by a French engineer, which, it is claimed, will transport 25 wagons, loaded with 8½ cwt. each, at a speed of five miles an hour over a line of two feet gauge. It is evident, however, that though electricity is destined to play a principal part in the working of collieries, it must depend for a great deal of its success upon metalliferous mining, where the question of motive power, and the extraction of metal from the ores is very often fraught with considerable difficulty. Under these circumstances it is encouraging to learn, upon the testimony of Mr. Edison, that the application of electricity to metalliferous mining will soon be attended with results of great economical value.

EDISON'S PROCESS OF SEPARATING MAGNETIC IRON ORES.

An electrical concentrating works for the separation of magnetic ores is about to be established by Mr. Edison at Ogden, New Jersey, and the circumstances, under which this experiment is to be carried out, give reasons for believing that it will afford unquestionable proof of the industrial applicability of electrical science to the treatment of low grade and refractory ores. The work to be done with the magnetic ironstone at Ogden consists in merely quarrying out the rock, transporting it to the crushers, thence to rolls and screens where it is pulverised and passed through a sieve of 50 meshes to the lineal inch, and afterward to the magnetic separators. The separated magnetite is then loaded into cars, and the waste taken to the dump. It would be difficult to find a mining enterprise in which the technical problem is more simple or the financial question more involved. Mr. Edison hopes to conclusively prove in dealing with it that ore can be more advantageously treated by electricity than by other means. He certainly will have an excellent opportunity of proving his claim, since the rock upon which he will commence operations contains only 16 per cent of magnetite. If the experiment realizes anything like a profit it will be impossible to gainsay the services which Mr. Edison will have rendered to the metalliferous mining industry. If there is anything like a solid foundation to the claims that are being put forward the prospects of electricity in the separation of ores seems peculiarly auspicious. It has been applied to prevent mercury from "sickening" in the treatment of refractory gold ores in South Africa with satisfactory success, and a machine for this purpose is one of the exhibits at the Crystal Palace. In other branches of metalliferous mining the advantages of electricity are being continually exemplified by new instances.

ELECTRICAL SMELTING AND DEPOSITION

has fairly won a position for itself, and the latest reports upon the Elwell process show that the technical difficulties attending this utilisation of electricity have been surmounted. Hitherto, the industrial application of electricity has only been in its experimental stage, and as regards mining this application is as yet largely a matter of theory. But taking into account the achievements of electrical science in the past, and estimating from these its possibilities in the future, there is ample ground for anticipating an improvement in the processes of metalliferous mining that will enable proprietors of mineral properties to take fuller advantage of the resources at their disposal.

ENGINEERING NOTES.

The Nicaragua Canal.

The entire country is becoming more and more awake to the great importance of the Nicaragua Canal, and to the fact that it is absolutely necessary to our commercial progress that it should become essentially a Government work. It would be most suicidal to allow any other country to secure a pecuniary control over it, and scarcely less so to allow its control to pass into the hands of the money kings of even our own country.

The canal, instead of being a competitor with our overland railroads, would, if rightly managed and in the interest of the people, be beneficial to them in building up the country and creating a vast business for them, which it could not itself conduct—and indeed, which it would not need.

Recent experience has shown that waterways, instead of being competitors to railroads, are a benefit to them. Warner Miller, the President of the Nicaragua Canal Company, in a recent address, while speaking of the benefits to arise from the canal, said its construction might easily double the output of the Pacific Coast States in agricultural productions and find a ready and profitable market for them in Europe, because the cost of transportation would be reduced by the reduction in distance. Furthermore, it had been estimated that the increased value of the timber now standing around Puget Sound would pay for the construction of the canal. The great forests in the central part of the country are becoming rapidly depleted and new timber fields are best found on the Pacific Coast. It goes without saying that the building of the canal will rapidly increase the population of all the Pacific States. Their soil and climate are the best in the world, and the Coast is capable of supporting a population of 100,000,000 if all the lands are taken up and cultivated.

Senator Dolph gives three excellent reasons why the Government should extend financial aid to the Nicaragua Canal Company. First, because he desired to have the canal speedily constructed; second, because he desired that when constructed it should be under the control of the United States, and third, because he desired the canal to be capitalized only at its actual cost.

In the event of war between naval powers, the control of the canal would be so decided an advantage that no one can predict what might happen. But if the United States furnishes the money to build it, there will be no question as to the right of the American Government to control it. The \$100,000,000 the canal will cost is hardly a matter for consideration in view of the importance attached to the possession of the canal.

The simple and easy way to construct the canal is for the United States Government to endorse the canal company's bonds under conditions similar to those provided in the bill introduced into the last Congress, which placed, at least, the temporary management of the canal, especially the rates of toll to be collected, in the hands of the General Government. That bill furthermore gives to the Government the power to purchase and hold perpetually in its own right a majority of the stock of said company, in the proportion of 70 to 100 shares, if it shall decide it may be for the public interest that such purchase be made.

Under that bill the nation will thus acquire the right of control whenever it sees fit to assert its right. We do not want foreign capitalists to build it, nor transcontinental railroad men. The canal should be maintained as a competing route between the two American coasts, with tolls as light as the nature of the service will permit. The Nicaragua Canal is practically the only competitor to a transcontinental railroad. The Canadian road is always for sale to the highest bidder and consequently no competitor at all. The key to the value of the Nicaragua Canal as a competing route lies in the power to fix the rate of toll. The canal will always be open to vessels of all nations, but an excessive rate of toll would impair its usefulness as a competing route.

SIDE-WHEEL STEAMERS DISAPPEARING.

It is probable that the magnificent side-wheel passenger vessels plying on the Long Island Sound will be succeeded by screw boats. One of the lines is having two propellers built, and if they prove successful it is believed that no more side-wheelers will be erected for this service.

THE FIRST SUSPENSION BRIDGE in England was erected in 1741 across the Tees at Middleton. It was 70 feet span, and was erected for the use of miners. It consisted of two common chains stretched across the river and fixed into the rock at each side.

GOOD HEALTH.

Try.

A correspondent of the *Farm and Fireside* who has had considerable experience in such matters, suggests the following:

For sore throat, inflamed tonsils, quincy and even diphtheria, try a gargle made of equal parts of soda and pulverized alum, with a little carbolic acid. Put in a large bottle and add water.

If an insect crawls into the ear, close the other with a finger, shut the mouth and pinch the nose. The insect will crawl rapidly out.

If the child pushes a bean, kernel of corn or other obstruction into its nose, rub the nostril with Scotch or other snuff to provoke sneezing.

If anything gets into the little one's eye, a mother would not refuse to wipe it out with her tongue when she has learned that it would cause an irritation to do so.

For catarrh I use one-third pulverized burnt alum and two-thirds refined borax. Mix well and snuff up the nose a very small pinch of it both night and morning. If the throat is inflamed I take a pinch of the mixture and let it dissolve in my mouth. For a cold in the head the above snuff is excellent when snuffed up the nose.

MENTAL DISSIPATION.—"I know a literary man," says a philosophic friend, "who works from 12 to 13 hours a day. He complains—when he has time—that he hasn't half time enough to do what he would like to do. That man is a study. He is the best read man I know—is a living encyclopedia of knowledge. But he doesn't know enough to come to dinner. I presume such men are necessary to the world. It is a curious thing that the man who works hard with his brain conceives more work and is inspired by the ambition to accomplish it; whereas the man who hasn't anything particular to do never originates anything and finds it a task to do anything. These qualities often exist in the same man. Now, in my own case, when I am much driven, I think of lots of things I'd like to do if I had time. I make a memorandum of them and put them aside, working a little on this or that between times. Just as soon as I am relieved from mental pressure my thought capacity, industry and ambition collapse together. I think work, congenial mental labor, is a sort of dissipation. The more you have of it the more you want and the more you can do—until something snaps."

DANGER IN WEARING RUBBERS.—A chiropodist says: Since the streets became so muddy I have had a number of sufferers apply to me for relief. If a man has a corn I can take it out and relieve him, but if he is suffering from what I call "rubber fever" I can't help him and can only prescribe liberal foot bathing and a removal of the cause of the trouble. Rubbers should only be worn to keep the wet out, and they should be removed the moment the wearer gets indoors. Failure to note this gives a man wet feet in a far worse sense than if he had waded through mud ankle deep. It was the trouble resulting from forcing the perspiration to soak the stockings and keep the feet perpetually damp that drove rubber-soled boots out of the market. Even loose rubbers are a source of danger and the cause of many more serious colds than they avert. —St. Louis Globe-Democrat.

CYPRESS OIL FOR WHOOPING COUGH.

A correspondent of the *St. Louis Medical Journal* recommends cypress oil, distilled from the needles of the cypress tree (*cupressus sempervirens*), for whooping cough. Drop a little oil on the collar or pillow of the child at night, so that the fumes may be gently inhaled. The writer sums up his experience as follows: Cypress oil is the most promptly successful remedy for whooping cough; it is perfectly free from the disadvantages of many of the other known remedies, such as Belladonna, various balsams, etc. It is very easy of application, and has a strong, but not disagreeable, odor, to which the children do not object, and which after a short time they even enjoy.

A MEDICAL DISCOVERY, considered of no inconsiderable importance, was recently communicated to the Paris Academy of Medicine by Dr. Leon Danion, on the introduction of various medicines into the system of animals and men by means of electricity, which he has demonstrated by various experiments on himself. It is through the mucous membrane that Dr. Danion claims to introduce the substance by a method which, if borne out by experience, will revolutionize the healing art.

SAN FRANCISCO:

SATURDAY, MARCH 12, 1892.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Booth Improved Rock-Breaker, 185. Method of Automatically Dumping Mine Cars, "Barney" or Fusher for Dumping Mine Cars, 193. EDITORIALS.—Improved Rock-Breakers, 185. Passing Events; Cable Cars on Grades; A Reform Commenced; Miscellaneous, 192. Automatically Dumping Mine Cars, 193.

MECHANICAL PROGRESS.—A Tribute to America; Experiments on the Solubility of Metals; Another New Nail; A Gold Medal for the Bevington Welding Process; Maxim Oudnone; Changes in the Density of Nickel-Steel; Antiquity of Iron Work; Grate Surface; How to Soften Cast Iron; Testing Steel Wire; Cheapening Machinery, 190.

SCIENTIFIC PROGRESS.—Telsa's Wonderful Electrical Experiments; A New Filament for Incandescent Lamps; Progress in Chemical Science; The Marvels of Astronomy, 180.

ELECTRICITY.—Electricity in Mines, 191. ENGINEERING NOTES.—The Nicaragua Canal; Side-Wheel Steamers Disappearing; First Suspension Bridge in England, 191.

GOOD HEALTH.—Try; Mental Dissipation; Danger in Wearing Rubbers; Cypress Oil for Whooping Cough; Medical Discovery, 191.

CORRESPONDENCE.—Arizona Mines, 197. MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 183-189.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 200.

MARKET REPORTS.—Eastern and Local Metal Markets; Coal and Coke, etc., 200.

MISCELLANEOUS.—A Manual of the Steam Engine; The Omaha Mine Accident; Losses by Fire of Coal-Laden Ships; A New Use for Oil at Sea; Experiment With Stay Bolts; Early Hydraulic Lifting; Coal from Unga Island; British Coal Miners; It Made No Mistakes, 185. The Bennett Amalgamator; Alloys of Silver; Plymouth Con. Gold Mining Co.; A Safety Car Brake; The Pegleg Mines; Santa Paula; Americanite; To Boden Steel; Cable Alarm Boxes; The Tumboldt Oil Fields, 187. World's Fair Commission, 194. Impounding Debris, 197.

Passing Events.

Senator Felton has introduced his mining debris bill by which the Government is to collect a tax of three per cent on the gross output of the mines benefited by the restriction works to be put up by the Government. A smaller appropriation than was at first thought necessary will be asked for since all that is now wanted is an amount which can be profitably expended during the fiscal year ending June 30, 1893.

Several important mines in Montana and Colorado have shut down owing to the low price of silver. The prospects of favorable legislation on the silver question are better than they were a few weeks since.

The change in the directory of the Hale and Norcross mine is a distinct victory for reform in Comstock mine management. All the old directors and officers were displaced, and the mine is to be worked on a basis where the stockholders will have something to show for their money. The Hale and Norcross suit has shown up in a marked manner the bad practices which have prevailed, and it looks as if directors would have to be more careful in the future, especially if any officers of the Mining Stock Association are stockholders.

FOR the last month, \$18,000 in wages were paid out in Bodie, and nearly the same amount will be paid out this month. About 150 men are at work, and the town is livelier than it has been for five years.

A Reform Commenced.

The annual election of the Hale and Norcross Mining Company, which took place on Wednesday, was an interesting event in mining stock circles, in view of the recent litigation by which the practices of the mill ring were shown up. At the election the control of the mine passed into the hands of Mr. Flood. The following Board of Directors was nominated and elected: N. T. Messer, George R. Wells, W. S. Lyle, Charles H. Fish, W. H. Hart, W. Edward and A. G. Gurnett.

After the meeting the directors met and elected N. T. Messer President of the Hale and Norcross Mining Company, vice H. M. Levy, and Joseph Ryan superintendent of the mine, vice R. B. Keating. Both these officials occupy the same offices in the Andes Mining Company. This lets out every one of the old directors of the company, including President Levy, who still remains in Nevada, out of the way of legal process in this State.

The feature of the meeting was the protest of J. H. Tingman of the Mining Stock Association and a stockholder in the company. He read a communication in which he referred to the recent suit, where it had been shown that the milling company had paid percentages to officers of the Hale and Norcross Co., and had withheld a certain amount out of the ores worked. He protested against the delivery of any more Hale and Norcross ore to these millmen, and against the company paying out money to defend those who had looted the mine, and against levying assessments to provide funds for any such purpose.

Mr. Tingman said that the Mining Stock Association demands, first, that all the Hale & Norcross ores shall be reduced in mills leased or owned by the company, and that the directors thereof shall deliver no more ore to the nefarious mill ring to be looted; second, that full car sample and battery assays of all ores taken from the mine shall be furnished to the stockholders under oath as the law requires; third, that the board of directors to be elected to-day shall take immediate steps to recover the sums of money fraudulently paid to attorneys and witnesses I have mentioned.

Dr. W. N. Griswell moved that the protest should be spread upon the minutes, which was adopted. W. T. Baggett desired to have it stated in the minutes that the motion was carried without a dissenting voice, which was ordered.

There is really more in this than appears on the surface. Notwithstanding that Mr. Flood has taken charge of the mine, the stockholders have unanimously instructed the Directors to carry out the radical changes included in the above demands, and they will have to do it or get into trouble.

The Directors are really only the representatives of the stockholders, and must do as instructed by them. Generally the Directors have done about as they pleased, without any thought as to the stockholders, and this looks like the first move in a reform which will go much further.

These officers and directors have usually been looked up to with fear by "the street," as they have had their way for a long time. This move, however, has given more strength to "outsiders" than anything which has happened in ten years. While the brokers have only two representatives in the directory, they form a working minority. Already, it is stated, at their instance and by their motion, the superintendent's salary has been cut down to \$250 per month, and the \$250 a month assistant superintendent will be removed. They have sent for a complete list of employees and their duties for the purpose of cutting off useless men.

Attorney-General Hart is one of the directors, which is almost a guarantee that the reforms demanded will be carried out,

and the laws be enforced. Those who have been pillaging the mine and the stockholders, will be brought to punishment.

By forcing the Hale & Norcross into this position, it will result in bringing other companies into line. The indications are that it is the dawn of a new era for the Comstock. It places ordinary stockholders in a better position than ever before, and if this can only be followed in other companies, great benefit to legitimate mining will result.

Cable Cars on Grades.

The recent accident on the California-street cable line in this city has called attention to the subject of methods of controlling cable cars on steep grades, and the usual number of suggestions have been offered by people with no practical knowledge of the mechanical details of such cars or roads. Every time anything of this kind happens a number of inventors come to the front with plans or systems intended to obviate the difficulty. Safety devices are specially attractive, but in eight cases out of ten the plans offered have already been considered by the companies, who already own many patents which have not been applied, as well as many in use.

When the heavily loaded car rushed down the steep grade of the California-street hill, it was a very dangerous ride for the passengers. The car came over Powell street at half speed, and just as it got over the crest, the grip, in being tightened up on the cable, broke off short at the head. The gripman lost his balance, and before the brakes could be fully set, the car acquired great momentum, and its speed was not checked until it got half a block below Kearny street, where there is still quite a grade.

In addition to the ordinary wheel brakes, there are on these cable cars two sets of track brakes, one for the gripman to handle and the other for the conductor. The track brakes are wooden shoes which the levers throw down firmly on the flat top of the street rail or track, and are very effective. On this particular morning, however, the track was "greasy" from the fine drizzling rain which was falling. So the locked wheels and track brakes did not stop the car, which slid down the steep incline, at one time going about 30 miles an hour. With the track brakes there are four shoes, two on each side. Had these brakes been applied before the car acquired great momentum, it could easily have been stopped on the steep grade, notwithstanding the broken grip. As it was, no one was hurt in the wild ride, as all the passengers remained on the car, no one jumping off.

The great danger in such a situation is collision with teams at the street crossings, in which case, of course, the car is suddenly stopped and a smash-up results.

And this brings us to the point of importance in connection with these cars on the steep grades. An appliance has been invented called the slot brake, which is simply a wedge that can be forced down into the grip slot to suddenly stop the car in an emergency. Many people argue that had this slot brake been on the car, it could not have gone down the hill as it did.

It is very much of a question whether such an appliance would not have increased the danger to life and limb rather than lessened it. It is the sudden stop which throws people from the car or injures them. When the cars bring up on the safety bumpers at cable crossings, some one is nearly always hurt, and then they are running only at ordinary speed. Experience proves that the wheel and track brakes are very effective when promptly applied. The men are ordered to be at their brakes on the hill, but the conductor is not always at his post by any means, although supposed to be. In case of accident to the gripman, as in this instance, prompt application of the track brake by the conductor would

have prevented the runaway. But neither set of track brakes were applied until momentum had been acquired. The gripman should also "tighten up" before he comes over the crest of the hill, because on the start down there is an extra strain coming suddenly on the grip anyhow, and this should not be increased at that point.

If the brakes had been promptly set on the car of which we are speaking, there would have been no need for a slot brake; and if, after the car got started, a slot brake had been applied and the car suddenly stopped, the passengers would doubtless have been thrown off and injured.

If it were possible under circumstances of such excitement to apply a slot-brake gradually, it ought to act very well; but it would be more apt to be applied suddenly, and the effect would then be as bad as a collision.

At Kansas City, where the cable cars run for some 800 feet on a ledge with an incline as steep as the California-street hill, they put "crabs" on the cars to lessen the danger of a runaway. The crab was an appliance which grasped the sides of the rail and could stop the car instantly. They were put on all the cars, but one test was enough to show that they were dangerous, on account of the sudden stop. They were all thrown into the scrap heap.

In the St. Paul accident on Selby avenue, when a car ran away, it turned once at a curve, killing one man and injuring others. On our San Francisco hills there are no curves in the tracks and the car can be stopped in time as the grade lessens, provided the usual brakes are properly set.

Sand-boxes are to be placed on the cars, so as to give the track brakes a good hold. But on slippery days these hill tracks should be sanded by a track-walker, and not depend on boxes on the cars. Then there would be little danger of the car running away.

There have been very few accidents on our steep hills, but a few runaways would destroy confidence in the cable cars on the grades. The companies should therefore be very strict with their employees. Under no circumstances should the conductor leave the platform to collect fares or do anything else when on the hill; and the sudden "cinching up" on the start down the grade should be stopped at once and the men shown where to tighten their grip.

The Hydraulic Mining Bills.

The Miners' Association delegates, Messrs. Searles, Hobson, Luttrell and McMurray, on Wednesday, appeared before a subcommittee of the House Committee on Mines and Mining and made extended arguments in favor of the debris bill recently introduced, and the subcommittee will at once prepare a report which will no doubt be favorable.

It is confidently believed that the whole committee will make a favorable report to the House with the appropriation considerably reduced. The figures were introduced in the bill to show the cost of a complete system of works, but it is not expected that Congress will grant more than can be profitably expended this year.

Three bills relating to mining debris are now before Congress—the Geary, Caminetti and Felton bills. It appears probable therefore that some action will be taken this session. If even a start is made, it may be taken as cause for congratulation on the part of the miners. If they know that something is to be done toward the dams, it will show that in the end the mines will again be permitted to be worked. The delegates at Washington are encouraged to believe that everything now looks favorable.

THE Kennedy mine, located near Jackson, Amador county, commenced to pay dividends something over a year ago, and since then has paid twenty-three, aggregating \$372,000, the last being one of 50 cents a share, paid January 7, 1892.

Automatically Dumping Mine Cars.

In describing the iron breaker at Drifton, before the American Institute of Mining Engineers, Mr. Eckley B. Ooze also describes some of the machinery for handling coal at the Cross Creek Collieries, Pa. Part of the coal prepared in the breaker comes from a mine about half a mile away. The loaded mine cars are brought by a small locomotive to the foot of the breaker plane, from which they are hoisted to the top of the breaker and dumped. The method of doing this is ingenious. The hoisting rope is attached permanently to the "harney," which is the local name given to the small car that pushes up the larger one. This "harney" is shown in the accompanying cuts. The gauge of the mine car is four feet and that of the harney three feet six inches.

The upper part, or pusher, of the harney is hinged to the hack end, and at the front end carries two small wheels which, as the harney descends, lift the latches which are hinged at their upper end and fall freely, so that when the engine is reversed and the harney is hoisted, these latches catch the wheels and force the pusher open.

The mine car when it reaches the top follows a rail until the front wheel reaches a point (6) where the rail turns off. The hind wheel having reached a point just in front of that occupied by the front harney-wheel in the figure, and the harney being on the track where it is steepest, the line of thrust of the pusher is no longer on the line of the axis of the humper, but in an

automatically releases the door of the car, and the car empties. In this system of hoisting, the rope is never attached and detached.

tal; 18, front truck-wheel axle; 19, lower sill of pusher-frame; 20, wire hoisting-rope; 21, pusher-shaft brace; 22, pusher-wheel axle; 23, cap for hack truck-wheel pedes-

wheel pedestal; 32, tie bolts for pusher-shaft strap; 33, braces in pusher-frame; 34, pusher-shaft strap; 35, binding bolts for pusher-frame; 36, thin binding for pusher-

upward direction. Hence, as soon as the front wheel of the car is stopped at 6, the harney continuing to move raises the hack end of the car until it assumes the position shown in the figure, the body of the car turning on the front axle. The latch

The following are the numbered parts, showing details of the harney: 7, back wheel; 8, pusher-wheel for raising pusher; 12, check-horn; 13, riding-horn; 14, wire-rope socket; 15, main truck-frame; 16, pusher-shaft; 17, hack truck-wheel pedes-

tal; 24, cap-bolts for hack truck-wheel pedestal; 25, rope-clevis; 26, front truck-wheel; 27, hook on end of pusher-shaft brace; 28, pin for rope-clevis; 29, colter for rope-clevis pin; 30, top bolts for pusher-shaft brace; 31, base bolts for hack truck-

frame; 37, front truck-wheel pedestal; 38, cap for front truck-wheel pedestal; 39, bolts for front truck-wheel pedestal; 40, guard for rope; 41, upper sill of pusher-frame; 42, base bolts for front truck-wheel pedestal; 43, vertical bolts for front truck-wheel

pedestal; 44, bumper-plate for pusher; 45, bolts for bumper-plate on pusher; 46, bolts for braces in pusher-frame; 47, bottom brace-bolts for pusher-shaft; 49, large timber under pusher-shaft; 50, binding-bolts for front part of truck-frame; 51, cast iron bearing-block for pusher-shaft.

For details of the Barney dump, the numbered parts are as follows: 2, mine-car rail; 3, Barney rail; 4, abrupt change in grade of Barney rail; 5, second change in grade of Barney rail; 6, check horn on end of mine-car rail (2); 27, five-foot sheave wheel; 28, heavy timber under rails; 29, floor on top of plane; 30, beam over wrought-iron girders.

On mine car X: 9, tail gate; 10, gate latch; 11, bumper; 17, cross beam on back of car; 23, front car-wheel axle; 24, front car wheel.

On dump chute: 2, sides on chute bottom; 3, cast-iron chute plates; 4, web on chute plates; 5, I-beam supporting chute plates; 6, angle-iron stiffener on I-beam; 7, brace for I-beam; 8, top flange of dump girders; 9, fish plate on upper side of I-beam.

World's Fair Commission.

The California World's Fair Commission met Tuesday and discussed various matters of importance. Commissioner Irving M. Scott presided.

F. J. V. Skiff, Chief of the Department of Mines and Mining, stated in a communication that he had mailed to the Commission 150 copies of a pamphlet containing the special classifications and rules of the Department of Mines and Mining. He asked that copies be sent to the leading mining corporations, metallurgical establishments, geologists, mineralogists, mining engineers and assayers throughout the State. Favorable action was taken.

A communication was received from J. M. Samuels, Chief of the Department of Horticulture, submitting a list of plants, including 500 orange trees in fruit, needed in the great department buildings. He suggested that steps should be taken at once to secure the plants and trees, and the Secretary was instructed to communicate with nurserymen throughout the State asking them how and when they will furnish the plants desired by Mr. Samuels.

State Mineralogist Wm. Ireland addressed the Commission relative to a mining exhibit at the Fair. He said that a fine exhibit would do more to advertise the mineral resources of this State than any number of pamphlets upon the subject could hope to accomplish. The exhibit would be largely furnished by the Mining Bureau, provided the Commission would bear the expense of shipment, placing in position, etc. No action on the proposition was taken.

State Fish Commissioner J. D. Redding advocated the appropriation of \$15,000 to cover the expense of a piscicultural exhibit. He said that it was as necessary to show the world what can be produced in California waters as on its fertile soil. He did not believe that the amount asked for was extravagant.

At the suggestion of Chairman Scott, it was decided to entertain any suggestions made by Mr. Redding or any person actively engaged in pisciculture and consider them in detail at a subsequent meeting.

Willard Johnson of the United States Geological Survey suggested the need of making a relief map of California on a scale of two inches to the mile. This map, he said, should be constructed in five large sections, showing the mountains, valleys, forests, rivers, etc., of the various portions of the State. He thought the map could be constructed for about \$2500, and said that the price would prove insignificant when its value from a scientific and educational standpoint was considered.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

A RICH strike of gold has been made in the Humboldt district, Arizona, and miners are flocking there by hundreds. The ore is free milling and runs into the hundreds per ton.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized.

The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. B. EVERETT.....Asst. Secretary.
H. PICHOR.....Treasurer.

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

SEC. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

SEC. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

SEC. 3. The President and Secretary of the Association shall be *ex officio* President and Secretary of the Executive Committee.

SEC. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

SEC. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

SEC. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

SEC. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

SEC. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

SEC. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

SEC. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittees as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

SEC. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

SEC. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

SEC. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

SEC. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

SEC. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of each intended meeting.

SEC. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

Assessment Notices.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Wednesday, the 9th day of March, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 310 Pine St., room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 19th day of April, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 9th day of May, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors
J. H. ISHAM, Secretary.
Office, No. 310 Pine St., Room 43, San Francisco, Cal.

FRANCIS SMITH & CO., Manufacturers of

Sheet Iron and Steel PIPE!

ALL SIZES.

130 Beale Street, San Francisco, Cal.

Iron cut, punched and formed, for making pipe on ground. All kinds of Tools supplied for making Pipe. Estimates given. Are prepared for coating all sizes of Pipe with a composition of Coal Tar and Asphaltum.

FOR SALE!

ONE 300 H. P. 24" x 60"

Corliss Engine!

Crank Shaft, Fly Wheel, Lubricators, Gauges and all Complete.

— APPLY —

Room 15, 310 Pine Street, San Francisco.

AT A BARGAIN

For Sale Cheap, Six Second-Hand

TRUE CONCENTRATORS,

Good as New. Also Second-Hand

STEAM PUMPS

Of various makes.

RISDON IRON WORKS,

Cor. Beale and Howard Sts., San Francisco.

QUARTZ SCREENS

A specialty. Round, slot or hurred slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron. Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

ASSAYER!

Wanted, a Position at Mine, Mill or Reduction Works.

GOOD ACCOUNTANT, AND BEST OF REFERENCES. Address ASSAYER, this office.

WHO WILL BE NEXT PRESIDENT?

NEELY'S GREAT HISTORICAL CHART POLITICAL AND UNITED STATES MAP.

A Double Wall Map, 5 feet 6 inches by 3 feet 10 inches, mounted on rollers top and bottom, ready to hang.

Better than an Encyclopedia.

A Panorama of American History.

Printed in Eleven Beautiful Colors.

LARGEST, LATEST AND BEST, WORTH \$10.00, GIVEN FREE.

IT TELLS

How many Presidents we have had and Politics of each. What party George Washington represented. What Presidents died while in office. How many Presidents served two terms. Which candidate received the largest number of votes and was defeated. When each political party was organized. How many Congresses have convened and the Political Complexion of each. The number of States in the United States and the one having the most miles of railroads. How many Political Parties have existed in the United States.

A Complete History of our Government by Administrations, Political Parties, and Congresses from Washington to Harrison.

On one side the latest U. S. Map, showing all States, Counties, Railroads and Towns (price alone, \$5.00) and on the other side:

A diagram showing all the Political Parties, 11x66. A diagram showing all the Presidents and Cabinets, 5x66. A diagram showing Political Complexion of each Congress. A diagram showing Creeds of the World, 13x10. A diagram showing Standing Armies of each Nation, 13x10. A diagram showing Naval Tonnage of each Nation, 13x10. A Complete Map of the World, 13x20. A Map of Central

America, 10x13. A Map of Alaska, 10x13. A Map of South Africa, 10x13. A Map of Upper Nubia and Habesh or Abyssinia, 10x13. A Map of Persia, Afghanistan and Beloochistan, 10x13. A Complete Map of Solar System, best ever made, 10x13. The Names of all Cabinet Officers, with length of term. Pictures of all the Presidents, from Washington to Harrison.

ILLUSTRATION OF MAP PACKED READY FOR SHIPMENT

INDORSEMENTS.

BENSON J. LOSSING, LL D., Historian: "Like a concave mirror, it reflects to a single focus an epitome of the essential elements of our national history, showing clearly at a glance the progress of the nation from its infancy to its present period of maturity."
 PROF. G. D. WITTER, JR.: "It is concise, complete, and in the study of political history indispensable."
 HON. J. C. BRANNER: "It can not fail to be of great utility to the people without regard to party or occupation."
 SUPT. G. R. SHAWHAN: "I think it very fine indeed."
 SUPT. A. F. CLARK: "Grandest success ever issued."

AGENTS' REPORTS.

"Received sample; sold 8 maps the first hour."
 "Magnificent map; my boy sold 12 the first day."
 "I sell 9 each day."
 "Have 7 agents at work selling 60 a day."
 "Called on 30 houses, sold 29 maps."
 "Made 16 calls, sold 21 maps."
 "I sell at every office, without exception."
 "Received the 10 maps, sold 7 before supper."
 "Sold 17 yesterday, will send order Saturday."

The LARGEST AND LATEST U. S. MAP, printed in colors, covers the entire back and is the best published. It alone sells for \$5.00. The complete Reversible Map (printed on both sides) is 3 feet 10 inches, by 5 feet 6 inches, mounted on rollers top and bottom, with tape on sides. These two maps sell separately for \$10.00

This Magnificent Map will be sent (mounted on rollers, postage prepaid) to subscribers to the MINING AND SCIENTIFIC PRESS for \$1.00 in addition to the regular subscription price of the paper. The Map will not be sold to any person not a subscriber nor to any subscriber who does not stand credited upon our books with an advance payment. The premium is the best ever offered in California. Arizona Mines.

MINERAL PARK, ARIZ., Feb. 18, 1892.

TO THE EDITOR:—In 1875 a prospector who was out in the hills looking after his horse with the view of leaving the camp—there was nothing here—stumbled his toe against a boulder of horn-silver ore assaying over \$1,800 a ton. He “monkeyed” around there—called it mining, of course—about six months, and he took out over \$80,000. He located the mine and called it the “Metallic Accident.” That money was taken out of a hole—some one might call it a shaft—which is not over sixty feet deep. When the rich ore gave out he took a trip to the Centennial, and in less than a year he came back without a dollar and in debt. He never put one dollar in the mine to develop it. When he came back he sold it to three men for \$800, one of whom was a miner and the other two were not. They went down the hill and run a tunnel about fifty feet with nothing but hard rock in sight. They became dissatisfied and finally sold the property to an old farmer of Tehama county, Cal. He sends a man down here as a superintendent, who advises to run a tunnel ahead to strike the vein. He run about 100 feet, cut a six foot vein of low grade ore, right where the ore ought to be. But no; that wasn't the vein, so he kept on and run 160 feet farther in hard country rock without striking anything. A little circumstance happened then, which it is not necessary to relate here, and in consequence work was stopped, and with the exception of a few chloridizers who had worked the ground on the surface, sorting dumps, etc., nothing has been done with it since and it looks as if there never will. Of course it is a patented property and the owner don't even have to expend \$50 worth of work annually on it. Without a doubt, had one-eighth of the money that was taken out been expended on that vein it would have been one of the best silver mines on the Pacific Coast. But there it lies idle, another monument of bad management.

A few years afterward a prospector named Mike Dunn was coming down from Sherman's Peak where he had been prospecting, and in walking along, he either jumped a rattlesnake or the snake jumped him. However, he picked up a rock, threw at the snake and missed it. The rock broke and the snake got away. The rock looked like mineral and he brought it to town. He showed it to the same man that found the Metallic Accident, who sent it to Kingman and had it assayed. The result was 17 oz. gold and 1240 oz. silver. So they located it and called it the Rural. If there was one old timer who prospected the same ground, there were over 500 and at least over 1000 have walked over it, some every day for years.

They shipped considerable of the ore to San Francisco. A Colorado gentleman came along and gave Dunn \$10,000 for his interest. He then offered the other party \$25,000 for his; but no, his head swelled, and he wouldn't sell short of \$50,000, and it is a question if he would have taken that were it offered to him; consequently the ground lies idle and the holes in the ground are filled with water.

Just such things as that have retarded the progress of this camp. There was a piece of property that a miner wouldn't give \$500 for; a capitalist gives \$10,000 for a half interest, and after awhile he offers \$25,000 for the other half—not that it is worth it, but simply so that the property would belong to his company and he could put up mining machinery necessary for the development of the same. He also would have developed other property. But no, he couldn't get it; so he concluded to go home, as he had plenty of business to attend to there, and let the thing rest; and consequently we have a very dull camp.

We are, unfortunately, cursed with another lot of individuals who come here that never saw a mine or a piece of ore until they did come. They are here a little while and they know more about the mine on the different locations than the miners who work them, especially if strangers are around; and if things haven't gone just to suit them, they don't the camp and everything in it. They are going to leave it, etc., and the same no-account scrubs have been here for years, and you cannot drive them away.

If they should happen to strike a body of ore somewhere on the surface and get a few hundred dollars out of it, they have to go off somewhere on a splurge; but the same individuals will try to get back if they have to ride a brake beam; it's a pity the beam wouldn't break! As a general thing we have the most remarkably intelligent lot of experts (?) come here to examine mines that ever graced the business. They will come here representing themselves as millionaires or with a company back of them, and

they will hold a chair down at the saloon with their feet at an angle of 45 degrees on the porch post, and look at a hill a mile away, and tell you what is in it. Sometimes their company is foolish enough to put up money on their judgment, but in nine cases out of ten they are sure to lose, and their only excuse is to curse Arizona.

There has been, I know, considerable money put up for parties to come here and operate, to work and develop some properties here. The gentlemen who put up the money never come here to look even at what they were putting up money for, and are now cursing Arizona. I can say to you gentlemen that it is not the fault of Arizona. Before you put up any money or find any fault, come here and ascertain where your money has gone and see how much work you have had done for the money you have put up. There is but very little outside capital spent in this camp, and most of what there is has not been spent judiciously. The country has been self-supporting for the last 20 years, and that is saying a great deal for a silver mining camp. Where will you find another; especially when we are shipping most of our wealth out of the country? If you have made a failure and lost your money, put the blame where it rightfully belongs—with your representatives, if you please.

JAS. W. HAAS.

Impounding Debris.

Associated Press dispatches dated March 8th are as follows:

Senator Felton to-day introduced his mining debris bill. As expected, it contains a clause for an annual assessment of 3 per cent on the gross output of the hydraulic mines benefited, a definition of what constitutes material damage to a navigable river, and in a general way is simpler than Caminetti's bill in the House.

Secretary Elkins responded to Caminetti's joint resolution asking for estimates on the amount of money that can be profitably expended this year in constructing dams and restriction works to restrain mining debris. He furnishes estimates as follows, submitted by General Casey: Dam at De Guerre point Yuba river, \$150,000; restraining work below the dam, \$100,000; dam at Van Geisen's, Bear river, \$75,000.

Appended is a report from H. H. Benyard of the Corps of Engineers, dated at San Francisco, March 1st. Mr. Benyard says: “The board of engineer officers appointed to consider the hydraulic mining question in the State of California have reported the existence of vast deposits of material in various canyons of the rivers throughout the entire hydraulic mining region and in the plain below the debouch of the Yuba river from the foothills. A portion of this material will be carried down with each successive flood and will eventually find lodgment in the navigable portion of the river below, to the injury of navigation. The board proposed the erection of dams at the lowest point in the canyons of the Yuba and Bear rivers, and also the building of restriction works only on the Yuba between De Guerre point and its mouth.

“It was considered that these points (so long as hydraulic mining was not in operation) presented more favorable features for impounding works in the interests of navigation than could be found at other points above. In fact, to attempt to restrain the entire amount of debris, where now situated, would require works in every ravine, creek and canyon throughout the entire mining field. Being solely in the interest of navigation, and not in connection with the prosecution or resumption of hydraulic mining, the above estimates are presented. In the report of the board, estimates were presented for dams and restriction works and also for winddams. The latter, when mentioned, were solely for improvement of the Feather and Sacramento rivers.”

The amendments suggested for any bill on the debris matter are to erase the words “winddam” and “where now situated,” and to designate points where other dams and restriction works are to be located, viz, restriction works on the Yuba river below De Guerre point, a dam at De Guerre point on the Yuba river and a dam at Van Geisen's on the Bear river.

The California mining committee will appear before the Senate committee on Thursday and the House Committee on Mines and Mining on Friday. To-day the committee was granted a hearing before the House Committee on Rivers and Harbors, notwithstanding the fact that the last day for public hearings had long since passed. Caminetti first spoke on the needs of the Sacramento and San Joaquin rivers, and then gave way to Judge Searlee, who made an able, logical and unanswerable address.

He said he was not speaking for the miners, but for all the people who wanted natural avenues of commerce preserved. He proved that if steps were now taken to impound the debris it could be done at a cost of about one-half cent a cubic yard, while, if the plan of dredging from year to year was adopted it would cost every time any dredging was done, at least 15 cents a cubic yard. He was closely questioned by Chairman Blanchard, who does not seem to want to give California anything, and in every instance the arguments of the latter were clearly confuted. The estimates of the War Department for the improvement of these rivers amount to about \$50,000. It is thought by the Californians that the committee will agree to give about \$125,000. This will still leave the mining debris bill to work on, and the Senate may push the figure up considerably.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 1, 1892.

470,149.—FEED FOR NAIL MACHINES—M. Altmeier, Oakland, Cal.

470,150.—NAIL-ROLLING MACHINERY—M. Altmeier, Oakland, Cal.

470,086.—HYDRAULIC STUMP EXTRACTOR—A. Taylor, S. F.

469,847.—PURIFYING GAS—J. Wiesender, S. F.

470,089.—CAR—D. W. B. Williams, Prescott, A. T.

The following brief list by telegraph, for March 1, will appear more complete on receipt of mail advices:

California—Virginita M. Cone, Alameda, heat regulator for cooking stoves; John D. Hooker, Los Angeles, hydrant valve; John Lamburn and R. Richards, Dixon wheel plow; Dr. F. Oliver, Oakland, cultivator; Robert F. Phillips, San Diego, dental mouth mirror; Francis A. Potter, San Francisco, fruit jar; Henri Vignoe, San Diego, time valves operating mechanism; William Wedgwood, San Francisco, can-capping machine. Oregon—David W. Freeman, Fishhawk adjustable clutch or coupling device; Mathias Jensen, Astoria, can-capping and crimping machine. Washington—Frank P. Burkhardt, Spokane Falls, mechanical movement; Isaac N. Hennes, Ilwaco, steam excavator; John Redmond, Seattle, electric car brake. Utah—James Hoop, Ogden, beam-bolting apparatus.

New York—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

COMSTOCK S. M. Co., March 9th. Object, to operate the McArthur Forrest process in Storey, Lyon and Ormsby counties in Nevada. Capital, \$2,000,000. Directors—H. A. W. Tabor, P. G. Gow and T. L. Wiswall of Denver, Colo.; W. H. Garlick of Shasta, Cal.; A. B. Paul, D. W. Balch and A. B. Paul Jr. of this city.

CALIFORNIA AND NEVADA G. & S. EXTRACTION CO., March 9th. Object, to operate in Mono and Inyo counties in this State and Esmeralda and Douglas in Nevada. Capital stock, \$1,000,000. Directors—W. H. Garlick, John Mullien, George T. D. and H. Balch.

SITKA CONS. M. Co., March 9th. Location, Alaska. Capital stock, \$3,000,000. Directors—Gustav Niehaus, Rudolph Neumann, W. W. Gollin, Leon Sloss, George W. Sessions and Louis Sloss Jr.

A NEW MILL on the McArthur-Forrest system is being put up at The Needle, on the Colorado river, San Bernardino county, by Mr. Blake. The works are to have a capacity of 100 tons per day.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

MAGAZINE SHOTGUN.—Willis H. Ostrander, Merced. No. 469,900. Dated March 1, 1892. This invention relates to certain improvements in that class of weapons known as magazine guns, or repeaters. It is especially applicable to shotguns having two barrels upon a single stock. It consists of a stock having two barrels mounted thereon so as to slide forward and back, a mechanism whereby loaded shells are carried from the magazine and introduced into the barrels of the gun, and in certain details of construction in connection therewith. It is an improvement on a former patent by the same inventor, dated April 21, 1891, numbered 450,773.

HOOP OR BAND FASTENER AND TIGHTENER.—Charles Sparks, Sacramento. No. 469,889. Dated March 1, 1892. This invention consists in the novel construction, combination and arrangement of the screw-seat, or shell, the screw and the nut; and it consists, also, in combination with said screw-seat or shell and nut, of the means for connecting to them the ends of the hoop or band. The object of this invention is to provide a simple, economical and effective means for fastening and tightening hoops, hands and straps of all kinds.

CASH AND PACKAGE CARRIER.—Julius Finch, S. F. No. 469,896. Dated March 1, 1892. This is one of that class of cash and package carriers in which a basket is lifted by suitable hooks into engagement with the forks of a car traveling on a track above. The invention consists in a novel automatically-operating locking device for securing the crossheads of the basket rails to the car forks, in a spring attachment for the ordinary crosshead hook, and in a guard for the car forks.

RIVETING MACHINE.—Matthew Arnold, San Francisco. No. 469,891. Dated March 1, 1892. In this the inventor employs a horizontally-moving carrier with jaws, which are opened when the carrier is advanced to take a rivet from the delivery chute and transfer it beneath the punch, by which it is afterward forced down through the material upon the anvil. The inventor also shows a vertically-moving presser-foot, through which the rivet and punch pass, said presser-foot also being actuated in a vertical direction and having yielding springs, by which, after the presser-foot has been forced down upon the substance to be riveted, its shank is allowed to continue the movement in unison with the movement of the punch, until the rivet has been secured. By the construction described in the patent the inventor is enabled to leave the anvil in a stationary position and to properly guide and hold the rivet until the punch has forced it into the material, the vertically acting presser-foot acting in this capacity. It also greatly simplifies the mechanism necessary for the operation of the machine, dispensing with all devices and connections beneath the table for the movement of the anvil.

Steel Works of G. & E. Pennington & Sons.

Among the iron industries of this city, steel forging occupies an important place; and as the above named firm holds a leading position in this branch of work, it is thought well worth while to call the attention of those interested to some of its special productions.

By the aid of several furnaces, two powerful steam hammers and a small army of skilled and muscular workmen, these works are constantly hammering from the rough steel ingots, heavy shafts and cranks for ocean and river steamers, steel piston-rods, machinery and hammer steel, shear blades, round, square, flat or octagon bar steel, miners' drills, sledges, picks, crowbars, and, in fact, every recognized useful form into which steel is forged and fashioned for mechanical or commercial purposes.

Pennington & Sons have also added to their already finely equipped establishment facilities for manufacturing chain to order, in sizes and lengths to meet any demand. The members of the firm are men who have grown up at the forge, understanding thoroughly every branch of their work, and giving personal attention to every detail of their large and daily increasing business. The works are situated at Nos. 218 and 220 Folsom street, a visit to which will repay those who are interested in the heavy industries, or who enjoy the hum and clamor of machinery, the hiss and roar of furnaces, or the spectacle of hewn and brain working in unison.

SOME CHOICE Technical Books!

BRANNT.—A Practical Treatise on Animal and Vegetable Fats and Oils; comprising both Fixed and Volatile Oils, their Physical and Chemical Properties and Uses. The manner of Extracting and Refining Them, and Practical Rules for Testing Them, as well as the Manufacture of Artificial Butter, Lubricants, including Mineral Lubricating Oils, and on Ozokerite. Edited from the German and other sources by W. T. Brannt. 240 engravings, 730 pages, 8vo. Price.....\$7.50

BRANNT.—A Practical Treatise on the Manufacture of Soap and Candles: comprising the Chemistry, the Raw Materials, the Machinery and Utensils, and Various Processes of Manufacture, including a great variety of formulae. Edited chiefly from the German by W. T. Brannt. 163 engravings, 477 pages, 8vo. Price.....\$7.50

BRANNT.—A Practical Treatise on the Manufacture of Vinegar and Acetates, Lids and Fruit Wines; Preservation of Fruits and Vegetables by Canning and Evaporation; Preparation of Fruit-Butters, Jellies, Marmalades, Pickles, Mustards, etc. Edited from various sources by Wm. T. Brannt. Illustrated by 79 engravings. In one volume, 8vo, 479 pages. Price.....\$5.00

BRANNT-WAHL.—The Techno-Chemical Receipt Book. Containing Several Thousand Receipts, covering the Latest, most Important, and most Useful Discoveries in Chemical Technology and their Practical Application in the Arts and the Industries. By W. T. Brannt and W. H. Wahl, Ph.D. 78 engravings, over 500 pages. Price \$2.00

CREW.—A Practical Treatise on Petroleum: Comprising its Origin, Geology, Geographical Distribution, History, Chemistry, Mining, Technology, and Transportation, together with a description of Gas Wells, the Application of Gas as Fuel, etc. By Benj. J. Crew. With an Appendix on the Oil Regions and the Geology of Natural Gas in Pennsylvania and New York. By J. A. Ashburner. 70 engravings and two plates. 503 pages, 8vo. Price.....\$5.00

DAVIS.—A Practical Treatise on the Manufacture of Bricks, Tiles, Terra-Cotta, etc.—Including Hand-Made, Dry Clay, Tempered Clay, Soft Mud, and Stiff Clay Bricks, also Front, Hand Pressed, Steam Pressed, Re-Pressed, Ornamentally Shaped and Enamelled Bricks, Drain Tiles, Straight and Curved Sewer and Water Pipes, Fire Clays, Fire Bricks, Glass Pots, Terra-Cotta, Roofing Tiles, Flooring Tiles, Art Tiles, Mosaic Plates, and Imitation of Intarsia or Inlaid Surfaces, together with Enameling in Polychrome Colors, Composition and Application of Glazes, etc., including Full Detailed Descriptions of the Most Modern Machines, Tools, Kilns, and Kilmans used. By Charles T. Davis. Second Edition. Thoroughly Revised. 217 engravings, 500 pages. 8vo. Price.....\$5.00

DAVIS.—The Manufacture of Leather.—Being a description of all the Processes for the Tanning, Fawing, Curing, Finishing, and Dyeing of every kind of Leather; including the various Raw Materials and the Methods for Determining their Values, the Tools, Machines, and all Details of Importance connected with an Intelligent and Profitable Prosecution of the Art. By Charles T. Davis. Illustrated by 302 Engravings and 12 Samples of Dyed Leathers. 824 pages. 8vo. Price.....\$10.00

DAVIS.—The Manufacture of Paper.—Being a description of the various Processes for the Fabrication, Coloring, and Finishing of every kind of Paper, including the different Raw Materials and the Methods for Determining their Values, the Tools, Machines, and Practical Details. By Charles T. Davis. Illustrated by 189 engravings. 608 pages. 8vo. Price.....\$6.00

DAVIDOWSKY.—A Practical Treatise on the Raw Materials and Fabrication of Glue, Gelatin, Gelatin-Veneers and Foils, Isinglass, Cements, Pastes, Mucilages, etc. From the German by William T. Brannt. Illustrated by 35 engravings, 227 pages. Price.....\$2.50

DUPUIS.—A Treatise on the Manufacture and Distillation of Alcoholic Liquors. From the French of M. M. Dupuis by M. McKenney, M.D. Illustrated by 14 folding plates and several wood engravings, 743 pages. 8vo. Price.....\$10.00

FRANKEL-HUTNER.—A Practical Treatise on the Manufacture of Starch, Glucose, Starch-Sugar and Dextrine. Based on the German of Wagner. Illustrated by 58 engravings, 344 pages, 8vo. Price.....\$3.50

THAUSING.—The Theory and Practice of the Preparation of Malt and the Fabrication of Beer. By Julius E. Thausing, Professor at the School for Brewers, Modling, near Vienna. Translated from the German by William T. Brannt. Edited, according to the latest and most scientific practice, including the improvements in the brewing of Lager Beer introduced into the United States. By A. Schwarz and Dr. A. H. Bauer, M.A.C.S. 140 engravings, 8vo, 815 pages. Price.....\$10.00

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 10, 1892.

General trade begins to pick up, yet the uncertainty regarding the weather for the next 30 or 60 days will have considerable influence on distributive orders from the rural districts. The hot wave of last Monday and Tuesday did not do any material damage, and as cooler weather prevails now, no fears are felt regarding grain crops even on adobe land. The plant in most places has made too rapid growth, so that if a week or two of cool weather would set in, better crop results will follow. The threatened labor strike has apparently passed. This is said to be due to employers organizing for mutual protection. It is also claimed that this, their first decided success, will undoubtedly give them confidence to make bids for work without fearing strikes before the contract work is finished. Raw material continues to favor iron foundries and iron workers in general.

The local money market shows signs of oversupply. There is absolutely nothing of an inviting character for investors, but all appear hopeful that the future has better things in store and that opportunities for profitable investments will open up. The money markets at the East are reported fairly easy. The outward movement of gold does not appear to have any visible effect. This is reflected in the strong speculative character of railroad and other American securities in the face of heavy unloading by many large English merchants and dealers and manufacturers of various very wealthy class and large, or in fact, any market at all they were, of course, the ones that had to be sold. With a concentration of American securities, a big boom, based on merit, is among the certainties in the near future.

MEXICAN DOLLARS—The market is steady at around 7 1/4 cents.

QUICKSILVER—Receipts the past week aggregate 350 flasks. There is a fair demand. The exports by sea the past week aggregate to Mexico 10 flasks.

SILVER—The market strengthened under prospective favorable action by Congress on the free coinage bill, only to fall back again with the receipt of unfavorable advices. Two years ago, speculators at home and abroad entered the market and ran prices up quite high, but as time passed a gradual settling in prices set in, which ended this year with a lower range touched than ever before recorded. The decline entailed heavy losses on the bulls, from which they are slow to recover and which will keep other operators from entering the market on the bull side in expectation of much higher prices through favorable legislation by Congress. The feeling of conservatism is strengthened still further by a generally accepted belief that Pres. Harrison will veto any free coinage bill passed, and that if he does, the friends of bimetalism cannot rally a two-third vote to pass it over his head. English exchanges are, as a rule, more favorably disposed toward bimetalism, and are hopeful that an international monetary convention may result in favorable action being taken looking to remonetizing silver. The closing down of a large number of silver-producing mines is curtailing the production of silver very materially.

BORAX—Exports by water the past week aggregate 2019 cts. to New York. The market is steady at combination prices.

LIME—Receipts the past week aggregate 7114 bbls. This is the largest receipt within one week ever before recorded. There is a good export and home demand.

ANTIMONY—The market is easier at shading prices. New York mail advices quote as follows: 100% at 11c for Hallet's; 12 1/2% for L.N.; and 15c for Cook's, in wholesale quantities.

PIG IRON—The market is reported barely steady for both spot and to arrive, owing to the large foundrymen having freer supplies and not being disposed to enter the market except on forced concessions. In view of the favorable outlook for the wheat crop, the consumption on this coast is quite large. Eastern mail advices continue to note active competition on the part of Southern furnacemen, with lower prices quoted. This naturally is bringing in more buyers and, at the same time causing many pig-iron producers at the North to report their stocks. London cables to Iron Age report a stronger market for warrants, which is attributed chiefly to threatened labor difficulties and rumors that several large concerns have given notice of stoppage of operations during the fortnight commencing with the 13th inst., when trouble with the collieries is expected.

TIN—Imports the past week aggregate 31,470 boxes plate. The market is barely steady. It is claimed that a renewed demand is expected to set in soon, but even with this, no improvement in prices is looked for.

LEAD—The market appears to have a steadier tone. New York mail advices state that the market is grounding around bottom.

COPPER—Exports by sea the past week aggregate 2470 cts. of matte to New York. London cables to Iron Age, March 3rd, report as follows: "Good buying of forwards has imparted some confidence, but this demand has been taken advantage of by holders willing to secure profits. Outside speculative interest is still of moderate proportions. Business in furnace material has been on a large scale, including contracts for 3000 tons Anaconda matte, deliverable 1000 tons a month, at a sliding scale of prices to be governed by the movement in selling prices of merchant bars. It is reported that a French syndicate is forming to acquire Anaconda mine properties, and should the project be successfully carried out, the affairs of the company will be controlled by an Anglo-French board of directors."

COAL—Imports the past week aggregate as follows: Cokes 67,000 tons; bituminous 5902, Philadelphia 200, Seattle 600, Greenock 1581, Newcastle Bay 220, total 113,331 tons. The market for cargoes in all positions is slow, with buyers well supplied. The outlook is not at all favorable for an improvement in prices unless the wheat crop has a setback within the next 60 days.

Eastern Metal Markets.

New York, March 10.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	41 1/2	90 1/2	10 50	4 15	19 55
Friday.....	41 1/2	90 1/2	10 50	4 15	19 50
Saturday.....	41 1/2	90 1/2	10 50	4 15	19 50
Monday.....	41 1/2	90 1/2	10 51	4 15	19 50
Tuesday.....	41 1/2	90 1/2	10 50	4 15	19 50
Wednesday.....	41 1/2	90 1/2	10 50	4 20	19 50

The metal market shows no strength, with the general tendency toward higher prices. The option gains ground that much more active times are near at hand. Borax is steady. Quicksilver strong.

Mining Share Market.

SAN FRANCISCO, March 10, 1892.

Mining shares the past week were dull and lifeless. Considering the bear points put out for lower prices and that the stock pool is evidently manipulating with that end in view, the market holds up remarkably well. To more effectively conceal their purpose and throw the odium of low prices and no life to the market on others, inside manipulators through and by means, best known to themselves, are trying to make it appear that the unfavorable condition of the market is due to the Brokers' Combine trying to get outside shareholders to join forces so as to fight them (the stock pool). By referring to the action of the market the past two months it will be seen that had it not been for the combine forcing insiders to enter the market for shares with which to control the election of Sierra Nevada, Belcher and of Hale and Norcross, we would not have seen the market value for those stocks double and treble in price just before election day. The advance in these stocks carried more activity into other shares and created a higher range of values. Many shareholders sold out on the advance and in doing so they did well financially. In this connection it is well to revert back to the time when the late Senator Sharon and W. C. Ralston, both of the Bank of California, George H. Schultz as a free lancer, and the bonanza people (Fair, Flood and Mackay) were in the market as contestants. When there were active times and high fluctuating prices, as such as the stock pools and mill-rings were organized and formed into a trust company, the market and mines became a prey to financial vultures and the business went to the "bow wows." It is for the purpose of reforming the business that the Mining Stock Association was organized to look after the mines, and still later leading commission brokers combined to look after the stockholders. One was in demanding that it now looks as if success will crown their efforts and a new order of affairs for the better follow. There were two good points made by J. H. Tingman, secretary of the Mining Stock Association, in his protest against the management of the mine and demanding that certain reforms be made, which was read and unanimously adopted at the meeting of the Hale and Norcross shareholders. One was in demanding that both car sample and battery assays be given of all ores taken out and milled. The other was that no ore be reduced at any mill not owned or leased by the company. A failure to comply with the above and other demands will place the newly elected Board of Directors in a criminal position.

It is gratifying to see J. L. Flood, the young mining magnate, posing as a reformer. The many skeptics as to the sincerity of his motives will be convinced of their error of judgment if Mr. Flood insists on the superintendent of Con. Virginia giving car sample assays as well as the battery assays. He might even go still further in the good work by having the Board of Directors of the company lease the mill which reduces the ore. Mr. Lyman, superintendent of Con. Virginia, mine, says he acts under instructions from both Mr. Flood and Mr. Mackay, and Mr. Mackay says that car sample assays are a check against mill stealing.

The market opened this morning weak at lower quotations. After call, Hale & Norcross sold down to \$1 a share. The rest of the market shaded off from \$5 to 10 per cent. The next election contest will be for Crown Point, which in turn will be followed by that for Savage.

By those in position to know, it is claimed that there is quiet but persistent buying on the street of Quilotoa stocks. To facilitate the buying, low quotations are made on Call. In the Bodie shares, trading has been light, while the "Razor Blades" have been let severely alone.

News from Con. Virginia stock mines is uniformly good and affords no reasonable excuse for levying assessments. It looks as if it is done so as to force outsiders to sell their holdings before the reforms in the mining and milling of ore, that this paper has consistently advocated, are brought about. When the reforms are made so as to conform to the law under which the companies incorporated, then, and not until then, can the outside investor expect to derive any benefit from investing in the shares of the mines. Ophir and two other of the north end mines should be paying dividends; but instead, an assessment is talked of. In Con. Virginia they have high-grade ore which ought to allow of dividends being paid. In Best & Belcher, they are developing rich ore to the west. In Savage, on the Nevada level, near Gould & Curry, they are in about 40 feet of fair to high grade ore, the general average going high enough to admit of 50-cent, if not more, dividends being paid. This is the most important find reported for some time. Hale & Norcross has always been noted as having good to high grade ore, and now that the mine has to be worked to conform to the instructions of stockholders, it is not out of place to believe that the ore later named again, which will be as good as the company's lease a mill. No mention is made of the 50-foot wet ledge in Chollar, as is there a suspicious silence about the rich ore found to the west in several of the Gold Hill mines. From the Quilotoa district our advice report important work under way in two of the mines. From the Bodie district our advice report the mine is being worked, and that summer will have some ore milled soon. All the mines report encouraging work. Advices from the Tuscarora district are uniformly favorable, but the money received from the sale of ore does not materialize into dividends.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,
ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 10 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal iron of great tensile strength.
The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipes
in a bath containing a special mixture of ASPHALTUM, BITUM and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating, both inside and outside, rendering it impervious
to the alkalies of the earth, rust, etc., and is practically indestructible.

CAPACITY. 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

This Patentee and Manufacturers
cordially invite miners to critically
examine and pass judgment upon
this improved system of milling
and amalgamating ores in the fol-
lowing particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with
Stamps, Ball Pulverizers or and
other ore crushing machines now
before the public.

Send for Circulars and Price List.

RED CORD

SQUARE FLAX PACKING.

MANUFACTURED FROM STRICTLY FIRST-CLASS FLAX AND PURE LUBRICANTS. HAS NO SUPERIOR
for all Hydraulic Work. CALICO WATER WORKS CO., CALICO, CAL., Dec. 16, 1890.

W. T. Y. SCHENCK—Dear Sir: We find your "Red-Cord" Square Flax Packing the "Best." Yours truly,
J. R. LANE, Secretary.

This red cord runs the entire length. Put up in boxes of 20 feet, or coils of 60 to 80 lbs. For sale by all
dealers. W. T. Y. SCHENCK, Sole Manufacturer, 229 and 234 Market Street, San Francisco, Cal.

F. A. HUNTINGTON.

PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

F. A. HUNTINGTON,

— MANUFACTURER AND DEALER IN —

STEAM ENGINES AND MINING MACHINERY OF EVERY DESCRIPTION.

Dynamos and Electric Motors

FOR THE TRANSMISSION AND DISTRIBUTION OF POWER

Manufacturer of and Contractor for the Installation of all Kinds of

ELECTRIC APPARATUS.

The Dynamos and Motors manufactured by this Company develop the highest mechanical efficiency; they require little or no attention, are almost noiseless, and run with an entire absence of sparks at the brushes, rendering the daily trimming of brushes unnecessary.

Electric Power Apparatus for Quartz Mills, Hoisting, Pumping, Drilling, and all Mining Work, where Long Distance Transmission is desired, a Specialty.

Office and Works, 21 & 23 SPEAR ST., San Francisco, Cal., U. S. A.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffling surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

THE GIANT POWDER COMPANY.

— PATENT OWNERS OF —

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

GLADSTONE MINING COMPANY, C. J. Clark, M. E. Genl. Supt. FRENCH OULCH, Calaveras Co., Cal., Dec. 12, 1891.
MESSRS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and baffle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from nothing to 60 cts. per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.
C. J. CLARK, Genl Supt.

Price of 4-foot wide Plain Belt Frue Vanner..... \$550, f. o. b.
" " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

For any information, or for pamphlets, or for circulars or testimonials, call on or address us at our office.
ADAMS & CARTER, Agents FRUE VANNING MACHINE CO.,
No. 132 Market Street, - - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

(PATENTED.)
Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

Copies of Patents.

The Commissioner of Patents has just issued a brief official notice to the effect that "in consequence of want of room for the proper storage and arrangement of printed copies of patents, it will be impossible to fill orders in current issues until additional room is provided by the proper authorities." This means that a man who obtains a patent will be given his original document, but that he cannot obtain other printed copies from the Patent Office, even if he pays for them. Copies of back numbers may be obtained, but none after the issue of March 8th.

This is a decidedly backward step for the U. S. Government to take in its Patent Department. Every inventor wants one or more copies of his patent, and it ought to be furnished him at a nominal price as has always been the case.

The Patent Office is one of the few departments which pays all its own expenses and also yields a profit to the Government, yet that profit is taken away from it and transferred to the General Fund, and the Patent Office itself is crowded with work and needs more help, which it cannot

get because of lack of funds. This is an anomalous state of affairs. Public business is delayed; inventors are put to inconvenience, and now they are even told that they cannot get copies of their patents because there is no room to store or arrange printed copies.

The additional room needed to store these copies should be provided without any delay whatever. There are hundreds of firms which buy copies of all those patents connected with their special business, but this they can now no longer do. It seems a very poor reason to give—lack of room for storage and arrangement—for stopping the printing of copies. It would seem as if this room could be readily provided for each an important purpose. The circular of the Commissioner of Patents will doubtless have the effect evidently intended, viz: draw the immediate attention of the proper Congressional Committee, so that a remedy will be applied as soon as may be.

THE CYANIDE PROCESS.—We shall, next week, publish a full description of the McArthur-Forrest process, written by one of its originators. The process is just now attracting wide attention. It has been introduced recently in this State, and other plants are shortly to be started.

The Miners' Committee.

The committee of the California Miners' Association had its hearing in Washington on Tuesday before the House Committee on Mines and Mining. Judge Searles made a long argument, making every point clear to each committeeman. The feature of the day was the presence in the committee room of many Congressmen, who deserted the main hall to listen to Judge Searles' speech, and every one of them manifested a strong interest in the matter, joining in asking questions after the speaking had

concluded. Another hearing will be given in a few days, when Mr. Luttrell and Mr. Hobson will speak.

It is significant of the energetic work performed by the miners' representatives that members of Congress came to the committee rooms to hear the arguments on hydraulic mining. An interest has been aroused in the subject among the Congressmen which augurs well. The miners want the subject investigated thoroughly and want it understood clearly. The difficulty has been, heretofore, to get a hearing of any kind, on account of the prejudice which has existed.

When it is clearly shown, as it can be, that they only want to operate these mines on conditions which prevent injury to farming lands or rivers, little difficulty will be experienced in obtaining aid of some kind from Congress.

The California representatives in Congress have in every way assisted the Miners' Committee, and for once have pulled together in one direction. The members of the Committees on Rivers and Harbors and Mines and Mining have manifested unusual interest also. Dr. David T. Day, Chief of the Division of Mining Statistics and Technology of the U. S. Geological Survey, has also greatly assisted the Miners' Committee. He is an honorary member of the Execu-

tive Committee of the California Miners' Association, and a very active, energetic worker. Several other gentlemen have also given valuable assistance. The Nevada Senators are also very friendly to the proposed appropriation.

On another page of this number of the PRESS is printed in full the Caminetti bill on Hydraulic Mining, which miners will do well to read. It is one of the three bills now pending. The others were introduced by Congressman Geary and Senator Felton. It is hardly probable that as much of an appropriation as was desired will be made

this session; but at the same time, it is certain that some step in advance will be made. Congress is being educated as to what hydraulic mining means for the State and the nation, and it is only a question of time when its importance will be fully recognized.

The Ball Engine.

We take pleasure in bringing before the notice of steam users, in this week's issue, a cut of the Ball engine, of what is known as the tandem compound high-speed type. This make of engine is superior for electrical application (electric lighting, railroad plants, etc.), and it is now being introduced very extensively throughout the State. In every place where the engine has been in operation, it is giving entire satisfaction, not only succeeding in performing what is claimed for it, but exceeding the expectations of the builders as well as the purchasers.

Among the many plants which have been recently arranged, is the new electrical one of the Sbaron estate in the Palace hotel building, which has been fitted up with a number of these engines, and is now in perfect running order.

Among the special features claimed for this engine are its simplicity and compactness; the solidity and strength of the bed; the unusually large bearings and wearing surfaces; excellent material and workmanship; durability; the smooth and quiet running of engine.

The advantages which this engine possesses consist of a high-pressure valve, with its connections on one side of the engine, and a low-pressure valve and valve motion on the other. This arrangement (which is patented) makes the moving parts readily accessible and avoids complexity and unsatisfactory results of other forms of valve motions.

There has also recently been added an improvement in the way of a hand-hole on one side of the low-pressure cylinder, giving facilities for examination of its interior, the condition of packing rings and fastening of piston head to its rod.

The fuel economy is about the best attainable for an engine of its type, and it is claimed that it will maintain this economy for a much longer period than is possible with any of the various forms of engines on the market. The engine, as shown in the cut, will readily commend itself to any fair-minded engineer. The Risdon Iron and Locomotive Works of this city are the coast agents for the various forms of the Ball engine, of which that illustrated is only one. Simple, tandem-compound, cross-compound or triple-expansion can be furnished.

RICH quartz is reported about five miles up the river from Truckee.

THE BALL TANDEM COMPOUND ENGINE.

To Regulate Hydraulic Mining.

Full Text of the Caminetti Bill before Congress.

The following bill was introduced in the House of Representatives, February 29, 1892, by Mr. Caminetti of California. Referred to the Committee on Mines and Mining and ordered to be printed.

Mr. Caminetti introduced the following bill:

The bill is entitled "A Bill to create the California Debris Commission, prescribe its duties, and define its powers, and to regulate hydraulic mining on the tributaries of the Sacramento and San Joaquin river systems, in the State of California."

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That a permanent commission is hereby created to be known as the California Debris Commission, consisting of three members, which shall have the authority and exercise the powers hereinafter set forth.

SEC. 2. That the objects and purposes of this act are: First, to construct such restraining and impounding dams, settling basins, relief canals, and other works calculated to protect navigable water ways and channels of the Sacramento and San Joaquin river systems from encroachment of and damage from debris resulting from mining operations, natural erosion, or other causes, and to permanently improve the same; second, to permit, in behalf of the United States, hydraulic mining on the tributaries of said rivers, and the respective branches of such tributaries, under the provisions of this act: *Provided*, That no injury or damage results to the navigable water ways and channels of said river systems.

SEC. 3. That the jurisdiction of said commission in so far as the same affects hydraulic mining shall extend to all such mining situated on the tributaries of said rivers and the respective branches of such tributaries the owner or owners of which elect to avail themselves of the privileges of this act.

SEC. 4. That the Secretary of War shall, within ten days after the approval of this act by the President of the United States, detail three officers of the Engineer Corps of the United States Army to constitute said commission. He shall also in like manner fill any vacancy that may occur therein.

SEC. 5. That the office of said commission shall be at the city and county of San Francisco to said State.

SEC. 6. That said commission shall organize within thirty days after its appointment by the election of a president, secretary, and such other officers and assistants as may be deemed necessary in the transaction of its business and performance of its duties. It shall also adopt such rules and regulations, not inconsistent with law, to govern its actions and the method of procedure for mine owners to avail themselves of the privileges conferred by this act.

SEC. 7. That the members of said commission and the secretary thereof are hereby authorized and empowered to administer oaths.

SEC. 8. That it is hereby made the duty of the United States district attorney for the northern district of California to attend in person or by deputy the meetings of said commission when thereto requested, and act as the legal adviser thereof on any matter of law that may arise. He shall also institute such proceedings and actions at law as may be requested by said commission in the enforcement of the provisions of this act, such actions to be commenced in the name of the United States of America.

SEC. 9. That it shall be the duty of said commission to mature and adopt such plan or plans, from examination and surveys already made and from such additional examinations and surveys as it may deem necessary, as will correct, permanently locate and deepen the channel and protect the banks of the said navigable rivers, improve and give safety to the navigation thereof, and promote commerce thereon. Such plan or plans shall be matured with a view of making the same effective as against the encroachment of and damage from debris resulting from mining operations, natural erosion, or other causes, and to restore, as near as practicable and the necessities of commerce and navigation demand the navigability of said rivers to the condition existing in eighteen hundred and sixty.

SEC. 10. That it shall further mature and adopt such plan or plans, from examination, surveys, and information now in the possession of the War Department and from such additional examinations and surveys as it may be necessary to make, as will enable hydraulic mining as defined in this act to be carried on without injury to the navigability of the said rivers.

SEC. 11. That it shall further examine, survey, and determine the utility and practicability, for the purposes hereinafter indicated, of storage sites in the canyons and tributaries of said rivers, and in the respective branches of said tributaries, or in the plains, basins, sloughs, tule and swamp lands adjacent to or along the course of said rivers, for the storage of debris or water, or as settling reservoirs with the object of using the same, by either or all of these methods, to aid in the improvement and protection of said navigable rivers by preventing the deposits therein of debris resulting from mining operations, natural erosion, or other causes, or for affording relief thereto in flood time, and providing sufficient water to maintain scouring force therein in the summer season.

SEC. 12. That it shall further be the duty of said commission to restrain, when appropriations therefor are made by law, by dams or other methods adapted to the purpose, all material lodged in the water ways and channels of the said rivers and the tributaries of each with their branches, in order to better protect said navigable rivers; to note, from time to time, at high and low stages of water, in said water ways, channels and rivers, the amount of material carried in suspension, and make cross-section surveys of the beds thereof at divers places thereon; to examine and estimate, from time to time, the amount of hydraulic mining carried on on each of said rivers or their tributaries, and ascertain what percentage of the material so mined goes into the stream immediately below the restraining works provided at said mine or mines; what portion

thereof goes down the main tributaries of a navigable stream, testing same at different places in the course thereof, and what percentage reaches the nearest point of navigation and from thence is carried in suspension to Suisun Bay, examinations to be made at different points thereon; to investigate such hydraulic or other mines as are now or may have been worked by methods intended to restrain the debris and material moved in operating such mines, by impounding dams, settling reservoirs, or otherwise, and in general to make such study of and researches in the hydraulic mining industry as science, experience, and engineering skill may suggest as practical and useful in devising a method or methods whereby such mining may be carried on without injury to the said navigable rivers.

SEC. 13. That said commission shall submit to the Secretary of War on or before the fifteenth day of November of each year a report of its labors and transactions, with plans for the construction, completion, and preservation of the public works outlined in this act, together with estimates of the cost thereof, stating what amounts can be profitably expended thereon each year. The Secretary of War shall thereupon submit same to Congress on or before the meeting thereof.

SEC. 14. That hydraulic mining, as the term is used in this act, is hereby defined as the process by which a bank of gold-bearing earth and rock is excavated by a jet of water discharged through the converging nozzle of a pipe, under great pressure, whereby the earth and debris are carried by means of water through flumes or otherwise and discharged on lower levels into the natural streams and water courses below.

SEC. 15. That the owner or owners, or, in the case of a corporation, its manager, or agent appointed for that purpose, owning ground in the territory in the State of California mentioned in section two hereof, which it is desired to work by the hydraulic process, may file with said commission a petition, verified before an officer authorized by law to administer oaths, setting forth a particular description of the ground so owned and amount thereof intended to be worked; depth of bank, and character of material constituting same; amount of earth to be moved; quantity of water to be used; number of monitors proposed to be employed; character and extent of dump; a statement of the fall from point of discharge to nearest stream; distance from navigable rivers; what facilities, at the mine, or elsewhere, exist for impounding and restraining debris or settling material carried in suspension after leaving impounding dams, or point of discharge of mine; what, if any, restraining or impounding works and settling reservoirs such owner proposes to build at his or its expense, of what material and at what place, also stating capacity thereof. The said petition shall be accompanied by plans and specifications of restraining and other works proposed to be built, and by maps and surveys illustrating as far as practicable the facts set forth in said petition.

SEC. 16. That the said petition shall set forth the name of the true owner or owners of the mines and lands described therein, and if owned by a corporation, its corporate name, principal place of business, name of officers and directors thereof.

SEC. 17. That said petition shall be accompanied by an instrument duly executed and acknowledged as required by the law of said State, whereby the owner or owners of such mine or mines surrenders to the United States the right and privilege to regulate by law as provided in this act, or any that may hereafter be enacted, or by such rules and regulations as may be prescribed by virtue thereof, the manner and method in which the debris resulting from the workings of said mine or mines shall be restrained, and what amount shall be produced therefrom. It being understood that the surrender aforesaid shall not be construed as in any way affecting the right of such owner or owners to operate said mine or mines by any other process or method now in use in said State.

SEC. 18. That the owners of several mining claims situated so as to require a common dumping ground or dam for the debris issuing therefrom in one or more sites, may file a joint petition setting forth such facts in addition to the requirements of sections fifteen and sixteen hereof. And where the owner of a hydraulic mine, or owners of several such mines, have and use common dumping sites for impounding debris, which sites are located below the mine of an applicant not entitled to use same, such fact shall also be stated in his petition. Thereupon the same proceedings shall be had as provided for herein.

SEC. 19. That upon filing such petition the said commission shall fix a date for hearing of the same at least thirty days after date of filing. Notice of such hearing shall be published for a period of ten days in a daily newspaper published at the city and county of San Francisco, and in a daily newspaper published in the city of Sacramento, notifying all persons that the petition (stating briefly its contents, giving name of owner and location of works), will be heard at such time and place as the commission may determine. Any person desiring to contest same shall file his objections in writing with the secretary of said commission at least five days before date of hearing.

SEC. 20. That pending publication of said notice said commission or committee thereof, if deemed necessary, shall proceed to the mine or mines set forth in said petition, examine same thoroughly, and inspect the topography of the ground below point of discharge of the said mine or mines.

SEC. 21. That on the day set for hearing thereof, or at such time as the same may have been postponed, the petition shall be heard in the following order, proceedings being conducted under oath: First, petitioner's proof, oral and documentary; second, contestant's proof, oral and documentary, if any. In contested applications the commission may permit rebuttal testimony to be offered; each party to have the right of cross-examination, and may be represented by counsel. The commission may permit arguments at the conclusion of such hearing.

SEC. 22. That the said commission shall, within thirty days after the submission of said proof, render a decision in writing, which decision shall be final, unless, for good cause shown by the defeated party, a rehearing is granted.

SEC. 23. That in case a majority of the members of said commission concur in a decision in favor of the petitioner, the said commission shall thereupon make an order directing the methods and specifying in detail the manner in which operations shall proceed in such mine or mines; what restraining or impounding works, if facilities therefor can be found,

shall be built; bow and of what material; where to be located, and in general set forth such further requirements and safeguards as will protect the public interest and prevent injury to the said navigable rivers, with such conditions and limitations as will observe all the provisions of this act in relation to the working thereof.

SEC. 24. That such petitioner or petitioners must within a reasonable time present plans and specifications of all works required to be built in pursuance of said order, for examination, correction and approval by said commission.

SEC. 25. That upon approval thereof work may immediately commence thereon under the supervision of said commission or representative thereof attached to the same from the Engineer Corps of the United States Army, who shall inspect same from time to time. Upon completion thereof the same shall be examined, and if found in every respect to meet the requirements of the said order and said approved plans and specifications, permission shall thereupon be granted to the owner of such mine or mines to commence operations subject to the conditions of said order and the provisions of this act.

SEC. 26. That no permission granted to a mine owner or owners under this act shall take effect, so far as regards the working of a mine, until all restraining or impounding works, if any are prescribed by the order granting such permission, have been completed and until the restraining or impounding works or settling reservoir or basins provided by said commission have reached such a stage as in the opinion of said commission it is safe to use same: *Provided, however*, That if said commission shall be of the opinion that the restraining and other work constructed at the mine or mines shall be sufficient to protect the rivers and work of said commission, then such mine or mines may be permitted to commence operations.

SEC. 27. That in case the joint petition referred to in section eighteen hereof is favorably acted upon, the commission shall fix the respective amounts to be paid by each owner of such mines toward providing and building necessary restraining or impounding works. In the event of a petition being filed after the entry of such order, or in case the impounding dam or dams have already been constructed, and if favorably considered, the commission shall fix such amount as may be reasonable for the privilege of dumping therein, which amount shall be divided between the original owners of such restraining or impounding dams or settling reservoirs, if any are used, in proportion to the amount respectively paid by each party named in the petition.

SEC. 28. That the expense of maintaining and protecting such joint dam shall be divided among mine owners using same in such proportion as the commission shall determine.

SEC. 29. That in all cases where it is practicable, restraining and impounding works are to be provided by mine owners near the mine or mines before reaching the main tributaries of said navigable rivers.

SEC. 30. That at no time shall any more debris be permitted to be washed away from any hydraulic mine or mines situated on the tributaries of said rivers, and the respective branches of each, worked under the provisions of this act, than can be properly cared for at said mine or mines, as per order of said commission, or by the restraining works erected in accordance with the directions of this act by said commission, or which in the aggregate will produce material to be carried in suspension in said rivers in excess of the carrying capacity of the currents therein.

SEC. 31. That the said commission may at any time when the condition of the navigable rivers or when the capacities of all impounding and settling facilities erected by mine owners or provided by Government authority require same, modify any order granting the privilege to mine by the hydraulic mining process, so as to reduce amount thereof to meet the capacities of the facilities then in use; or if actually required in order to protect the navigable rivers from damage, may revoke same until the further notice of the commission.

SEC. 32. That any material violation of the terms and conditions of such order, by any mine owner or owners, shall work a forfeiture of the privileges thereby conferred, and upon notice thereof being served upon such owner or owners, or agent in charge, work shall immediately cease.

SEC. 33. That said commission, or a committee therefrom, or officer of said corps assigned to duty under its orders, shall, whenever deemed necessary, visit all mines operating under the provisions of this act and examine the working thereof and condition of restraining dams and other works. A report of such examination shall be placed on file.

SEC. 34. That the said commission is hereby authorized and empowered to acquire by purchase, if feasible, if not, by condemnation in the proper court of the State of California, under the right of eminent domain in the name of and for the benefit of the United States, all such land, storage site for debris or water, places for construction of dams, settling reservoirs, rights of way for canals, tule and swamp lands, sloughs, and basins necessary in the prosecution and construction of the work contemplated by this act, either for the permanent improvement of said rivers, the protection thereof against the encroachment of and damage from debris resulting from mining operations, natural erosions, or other causes, lodged in said rivers and their tributaries, with their branches or for any purpose declared by this act to be a public use, or for rights of way necessary or incidental to any of the purchases and objects of this act, or for the purpose of procuring any stone, rock, timber, or other material necessary for the erection or construction of any of the works provided for by this act.

SEC. 35. That the use of any and all ravines, water courses, streams, canyons, places, storage sites, sloughs, or basins having their outlet or discharge into either of said navigable rivers, or any of the tributaries thereof, or from either of which the water or material may flow or find its way into either of said navigable rivers, or any of the tributaries thereof, as a place of deposit for any water, earth, sand, gravel, stones, boulders, or other material known as mining debris, resulting from the working of any mine or mines permitted to operate under the provisions of this act, is hereby declared to be a public use, and subject as such to the provisions of the same, and to such laws as now exist or may hereafter be enacted for their purchase, use, or control.

SEC. 36. That the said commission is hereby granted the right to use any of the public lands of the United States, or any rock, stone, timber, trees, brush, or material thereon or therein, for any of the purposes of this act; and the Secretary of the Interior is hereby authorized and requested that, after notice has been filed with the Commissioner of the General Land Office by said commission setting forth what public lands are required by it under the authority of this section, such land or lands shall be withdrawn from sale and entry under the laws of the United States.

SEC. 37. That any person or persons who willfully or maliciously injures, damages, or destroys, or attempts to injure, damage, or destroy, any dam or other work erected under the provisions of this act for restraining, impounding, or settling purposes, or for use in connection therewith, shall be guilty of a misdemeanor, and upon conviction thereof shall be fined not to exceed the sum of five thousand dollars, or be imprisoned not to exceed five years, or by both such fine and imprisonment, in the discretion of the court.

SEC. 38. That the Secretary of War shall, when requested by said commission, detail from the Engineer Corps of the Army such officers and men as may be necessary, and shall place in the charge and for the use of said commission such necessary machinery and instruments as may be under his control required for the performance of the duties of said commission. The Secretary of the Treasury shall, when requested by said commission, in like manner detail from the Coast and Geodetic Survey such officers and men as may be necessary, together with such transportation facilities, instruments and machinery, as may be deemed necessary.

SEC. 39. That the said commission may, with the approval of the Secretary of War, employ such additional force and assistants and provide by purchase or otherwise such transportation facilities, on land or rivers, and instruments or other articles necessary in the performance of its work.

SEC. 40. That it shall be the duty of said commission to apply the money appropriated by law for the building of works and improvements contemplated by this act by contract, when the same can be done without detriment to the interests of the Government; if otherwise, then the same shall be constructed by hired labor. When such works are done by contract such contract shall be made after sufficient public advertisement for proposals, in such manner and form and for such time as the commission may prescribe; and such contract shall be made with the lowest responsible bidder, accompanied by such security as the commission may require, conditioned for the faithful performance of the work according to contract and the plans and specifications accompanying same and for the full payment of all liabilities incurred in the construction thereof for labor and material: *Provided further*, That in no case, whether done by contract or hired labor, shall Chinese be employed in such work.

SEC. 41. All work done by mine owners, individuals, or corporate, in the fulfillment of the terms and conditions fixed by said commission in any order permitting hydraulic mines to be worked, shall be done by other than Chinese labor.

SEC. 42. That said commission, in order that such material as is now, or may hereafter, be lodged in the tributaries of the Sacramento and San Joaquin rivers, resulting from mining operations, natural erosion, or other causes may be prevented from injuring the said navigable rivers or such of the tributaries of either as may be navigable, is hereby directed and empowered to proceed without delay to build at such points above the head of navigation in said rivers, or either of their tributaries, as herein-after indicated, or at any point calculated, in the judgment of said commission, to effect said object, the same to be of such material as will insure safety and permanency, or, as indicated herein, such restraining or impounding dams and settling reservoirs, with such canals, locks, or other works adapted and required to complete same, as per recommendations contained in Executive Document Numbered Two hundred and sixty-seven, Fifty-first Congress, second session, and Executive Document Numbered ninety-eight, Forty-seventh Congress, first session. And for such purposes the following sums are hereby appropriated, from moneys in the Treasury not otherwise appropriated, to be immediately available, for the building and construction thereof and the acquirement of sites therefor when necessary so to do, at or near the places named in connection with each sum, respectively, namely:

For the erection of a stone dam at Rattlesnake Bar, on the American River, two hundred thousand dollars.

For the erection of a stone dam at Van Giesens, on Bear River, one hundred and fifty thousand dollars.

For the erection of a stone dam at De Guerre Point, on Yuba River, three hundred thousand dollars.

For restriction works on Yuba River below foot-hills, three hundred thousand dollars.

For the erection of a stone dam on the main Yuba River, at a point near the mouth of Deer Creek, known as the Narrows, three hundred thousand dollars.

For the erection at such place or places on Feather River as the commission may select, such dam, or dams, or other restraining works as said commission may deem necessary, one hundred and fifty thousand dollars.

For the construction and completion at such place or places as the commission may deem proper, of any settling reservoir, or basins for debris, or water, with necessary canals and locks, or such other restraining works as may be necessary, one hundred and fifty thousand dollars.

For the erection of dams or other restraining works as the commission may deem necessary on the tributaries of the Sacramento River in the vicinity of Redding, thirty thousand dollars.

For the erection of a dam at such place on the Consumnes River as the commission may select, forty thousand dollars.

For the erection of a stone dam on Sutter Creek, above Ione City, twenty thousand dollars.

For the erection of a dam or dams, near or above Jenny Lind, on the Calaveras River, thirty thousand dollars.

SEC. 43. That a further appropriation of the sum of fifty thousand dollars is hereby made, out of any money in the Treasury not otherwise appropriated, to be immediately available, to defray the expenses and for other uses of said commission in carrying out the objects of this act.

The Closing of the Blue Bird Mine.

On the death of Ferdinand Van Zant, President of the Blue Bird mine, Butte, Mootana, the mine was attached. The low price of silver has made it hard pulling for the silver-producing mines of Butte, and it appears that the Blue Bird was temporarily embarrassed. It owed something like \$40,000, mainly to the banking house of Hoge, Brownlee & Co. To raise this and other sums was Mr. Van Zant's mission to Europe. When the notes fell due, the bank attached the mine. The cablegram announcing this fact proved Van Zant's death warrant.

The men at the mine were all paid off on the 1st inst. The effect of the enforced idleness on the people of Burlington and Rucker will be very depressing. The Butte *Inter-Mountain* says:

There was quite a gathering of miners around the hoisting works yesterday watching the cages make their last trips in the shaft, hoisting the pumps out. The pumps now lie on the ground and the water is beginning to rise. The column pipes, however, were allowed to remain in the shaft.

The employees of the company were sorely grieved at the news of the death of their much loved employer, and every miner at the Blue Bird would gladly have given up his month's salary and worked several months for their board, if they thought he needed it, or if he had requested it. Many little friendly acts of Mr. Van Zant were recalled around the hoist by groups of miners who were discussing the situation. They recalled how he often mingled with them in the "dry," or at lunch hour, and chatted pleasantly, and how he frequently gave a helping hand if a car got off the track. They also recalled the many kindnesses shown by Mrs. Van Zant, who was greatly respected by the Blue Bird employees. None more than these miners and millmen regret more sincerely the crowning calamity that has befallen the Blue Bird Company, for they feel, with Mr. Van Zant gone, the Blue Bird Company dies with him.

The great property had been gradually losing strength for months, and week by week the noise of industry from the great mill grew weaker, until near the end only ten stamps were dropping. It transpires also that for a long time past the mill was working ore from the dump—second-class ore that was considered valueless while the great vein was productive. A little ore was occasionally taken out of the mine and worked with the ore from the waste dump.

It is now stated that had the company been granted 30 days more time, it would have pulled through all right. This statement is attributed to the mine foreman, who is quoted as saying that just about the time the climax came, good ore was struck in the east and west drifts of the 600-foot level—the deepest workings. It was the intention a short time ago to sink a new shaft at some point between the hoist and mill, but later it was decided to open up a winze from the 600 foot level, on an incline, to the depth of 1000 feet. This work it was fully expected would develop the continuance of the rich ore bodies below, but it was never carried out.

What the future will bring cannot be told at this time, although confidence is expressed that some of the other claims will be prospected. A new shaft was lately started on the Poormao, adjoining the Blue Bird, and the indications were very encouraging for the continuance of the explorations.

More Local Cable Roads.

The McAllister-street cable cars began running over the extension along the north side of the Park on the 9th inst. The new extension is along Fulton street from the old terminus at the top of the hill, seven blocks to Seventh avenue, and stops at the Park terminus of the Powell-street line.

J. L. Wilcutt, Secretary of the Market-street Cable Co., states that 25 men are at work breaking ground near the Park for the Park extension of the Geary-street cable line, which will do away with the steam dummies on that road. The new line will run over Fifth avenue from Point Lobos avenue to the Park, instead of over Third avenue. Construction will be rapidly pushed and the cable cars will be run to the Park when the extension is completed and the road reconstructed from the present terminus to the power house at Buchanan street. The entire present cable road is to be torn out and reconstructed without stopping travel on the line. The gauge is to be changed from 5 feet to 4 feet 8½ inches, to conform with the gauge of the Market-street lines.

Work will soon be resumed on the Page-street line, which was completed some time ago from First avenue on Frederick street,

on the south side of the Park, along Frederick street to Masonic avenue, thence to Page street, and along Page street as far as Baker street. The line will be completed along Page to Market, and crossing Market street will connect with the Market-street power house by way of Potter street.

The completion of the long-talked-of Mission-street cable line is promised for this year. The question of the grade at Army street is to be settled shortly, and the matter of the widening of Mission street has progressed so far that an opportunity for beginning operations has arrived. The rails have been ordered, and many of them are here. The work of putting in the roadbed is to begin within two or three months. All this activity on the part of the Market-street Cable Co. has been forced and hastened by the pushing competition of rival companies.

World's Fair Notes.

An Ohio World's Fair commissioner has estimated that the exhibitors from his State will spend upward of \$5,000,000 in the preparation of their exhibits for the Exposition.

Denmark will spend about \$500 in showing, as a leading feature of its World's Fair exhibit, a Danish dairy, complete and in operation. The dairy interest is one of the most important in Denmark, and the most approved methods and mechanical appliances are utilized in the dairies of that country.

Special World's Fair Commissioner Alexander Campbell has returned from Australasia, and reports that great enthusiasm over the Exposition is felt in that part of the world. New South Wales, South Australia, Victoria, Queensland, New Zealand, Tasmania, are all making extensive preparations for their representation, and splendid exhibits are reported sure to be sent.

The Governments of Norway and Sweden have, respectively, asked for World's Fair appropriations of \$61,288 and \$53,600. In Norway a number of private citizens are raising a fund of \$10,720 with which to build and send to Chicago a counterpart of the Viking ship which was exhumed near Sandefjord, a few years ago.

W. L. Libby & Sons of Toledo intend to erect, on Midway Plaisance, a factory in which the manufacture of cut glass can be seen, from the furnace, on through the cutting, finishing and decorating departments, until the finished product is turned out. The factory plans call for a structure 125x200 feet, of stone, iron and glass, and with imposing dome. The firm intends to spend \$40,000 on the building alone.

Suironow & Co. of St. Petersburg, Russia, will exhibit a complete suite of apartments of a "Boyar," or wealthy Russian noble of the XII century, and also the cabin of the rich Russian peasant of modern times. Each of these exhibits will be in a separate pavilion of distinctively Russian architecture. The great samovar factory of Toula, Russia, will send to the Exposition a large exhibit of its products. It will also erect a great teahouse that will be a great reproduction of the most luxurious of these establishments to be found in the great cities of Russia in the early part of this century.

Remenyi, the well-known violin virtuoso, has made application for a space of not less than 400 square feet in which to exhibit his great collection of rare African ethnological specimens. The selection, which comprises over 1500 carefully selected specimens, has been formed during the last forty years, and is beyond question the most perfect of its kind. It is especially rich in the ancient regal symbols in use among the Zulus, including sceptres, royal bracelets, which were used instead of crowns, and other emblems of hammered silver, of carved and polished ivory, and of rhinoceros' horn. The royal bracelets are especially interesting. They are hollowed rings made from transverse sections of huge elephant tusks and, until his death, were never taken off, after once placed on the arm of the king. There are also several splendid specimens of the exceedingly rare and beautiful royal silk mantles of the sovereigns of Madagascar, three hundred and more years ago. These mantles are curiously adorned with broderies of metal and of uncut precious stones and of feather work. Every specimen in the collection is perfect and unique of its kind.

Inquiry made by a Brooklyn, N. Y., firm of the Treasury Department regarding machinery imported for exhibit at the Chicago Exposition elicited a prompt response from Acting Secretary Spaulding. He held that machinery brought over to the United States for the purpose of illustrating a certain manufacturing process at the Exposition would be admitted free of duty. Raw material, however, imported for use in such a manufacturing process, would be subject to duty under all circumstances.

Copper Product of 1891.

The Calumet & Hecla Mining Co. has still neglected to furnish us with the official statement of its production of copper in 1891, but we have good reason for estimating it at 56,000,000 pounds instead of 65,000,000 pounds, which was the figure that we quoted it at in our annual statistical number. The error was through a transposition of the figures which was confirmed by the known output of mineral of the company during the year. Had this mineral averaged 70 per cent, which is lower than its average in former years, it would have made 65,000,000 pounds; but as a matter of fact, the Calumet & Hecla mineral is now running very much lower than it ever did before. This change in the production of this company will make a corresponding change in the output of the Lake Superior mines, which will be 104,370,000 pounds, or 46,594 tons of 2240 pounds, instead of 115,370,000 pounds, or 51,505 tons of 2240 pounds, and the total production of the United States 287,620,000 pounds, or 128,402 tons of 2240 pounds. Adding to this the stocks on hand January 1, 1891, which amounted to 101,000,000 pounds, or 45,089 tons of 2240 pounds, and the imports of copper in pigs, bars, etc., which according to revised figures amounted to 3,060,000 pounds, or 1367 tons of 2240 pounds, the total available supply was 391,680,000 pounds, or 174,858 tons of 2240 pounds. Deducting from this the exports of copper during the year, which were 114,800,000 pounds, or 51,250 tons of 2240 pounds, and the stocks on hand December 31, 1891, which were reported to us as 76,000,000 pounds, or 33,929 tons of 2240 pounds, the consumption of copper in the United States during 1891 was 200,880,000 pounds, or 89,679 tons of 2240 pounds, which was an increase of 11,596,000 pounds over 1890.

We have received additional reports of the output of some of the principal copper mines of other countries. The product of the Cape Copper Co. for 11 months was 4500 tons of 2240 pounds. The product of the following mines is for the 12 months of the year in tons of 2240 pounds: Mansfeld, Germany, 14,395; Boleo, Mexico, 4036; Newfoundland (Little Bay), 700; Quebrada, Venezuela, 6716; Mason & Barry, Portugal, 4150; and Seville, Spain, 960.—Engineering and Mining Journal.

Proposed Mining Tax in Mexico.

A plan of taxation on mines has been submitted to President Diaz, which in substance is as follows, according to the *Financier*:

I. A Registry Office, in which all titles to mines will have to be inscribed, is to be opened in the Department of Finance.

II. Titles will be issued by that office subject to a stamp tax of \$100 each.

III. From and after July 1st next, mines will be subject to an annual tax of \$300 each, payable either in triennial, monthly or weekly installments.

IV. The nation to guarantee to the operators of mines, as long as they pay the aforementioned taxes, an absolute right to their mines, whether they be in operation or not.

The *Financier* remarks that a Federal tax on mines, however light, may appear to be peculiarly ill-timed in the present depressed condition of the silver market. On the other hand, it should be noted that the outlined project secures a substantial equivalent to mine owners by freeing them from the harassing fear of denunciations and of expensive and vexatious litigation. At the present moment, mines in which operations are suspended for a given length of time (see Art. 50 of the Mining Code) are liable to denouncement, no matter how heavy the expenditure of the dispossessed parties may have been, and though their inactivity be due to circumstances totally beyond their control. Naturally, this legislation has often been felt as a considerable hardship. It is true that the law provides the resource of "amparo," a proceeding by which possessors of mines are secured from denouncement; but the "amparo" is, after all, an inadequate form of protection, not only because it is granted under restrictions and for a limited time, but because in many cases it is not obtainable without expenses and delays. It is, then, not unreasonably maintained by the framer of the new plan that the proposed tax would be a boon instead of a burden to many miners, affording them, as it would, a species of protection far more valuable and ample than the amparo, at probably less cost and with greater simplicity, promptitude and certainty. It is estimated that there are at present in operation in different parts of the country 8000 mines.

GOLD, DIAMONDS AND RUBIES.—The Placerville *Democrat* says: The Tockey

mine, better known as the old Franklin gravel mine, on Texas Hill, has again come into prominence, not as a producer of bullion as is usually the case, but as a yielder of precious stones. One day last week while panning for gold, the owners discovered among the tailings a shining substance, which upon examination proved to be a diamond. It was brought to town and was pronounced by all our jewelers to be a first-water diamond. The mine also yields rubies.

A Copper Combine.

Associated Press dispatches dated New York, March 10th, are to the following effect: Rumors of a great combination, which, if effected, will involve millions of dollars, is just now proving a matter of prime interest to manufacturers and dealers in copper and holders of copper mining stocks.

For months copper prices have been very low and the tension upon most of the copper-mining companies in the Lake Superior region, Montana, Arizona and New Mexico to keep things going has been severe. It has been urged by copper men that some combination to limit the production should be forced, but only within a very recent time has the matter assumed shape. Negotiations have been carried on very secretly. The course of prices, however, in the Boston market has shown things to have been going on favorably.

A Boston dispatch received this afternoon says: "The statement is made here on good authority that the proposed combination of copper mine properties, with the exception of the Quincy Company, which declined to join, has practically been effected. It is stated that the annual production of the Anaconda mine has been fixed at 70,000,000 pounds, and that of the Calumet and Hecla at 60,000,000."

J. B. Haggin denied to-night that it was the Anaconda's intention to add any Western mines to its plant. He declined to say anything about the effort of producers to fix a uniform price on the limit of production.

"The trust would have been brought about and a uniform price fixed by the largest producers if a certain big company did not desire to get control of all the copper mines in the West," said a man who knows all about the conferences which have been held between the copper men. "There are big mines in Arizona and New Mexico, as well as in Montana, and if one company were in control of these, it would be in a better position than at present to fix the prices to suit itself. Mining companies in Arizona and New Mexico are not making much money at present, and are perfectly willing to enter into agreement with the Anaconda Company of Montana and the Calumet and Hecla Company of Michigan, but are not willing to sell the controlling interest in their property to any other company, and as the Anaconda Company wants to get hold of these companies it promises to oppose any measure that will place these mines in an independent position, and it is to the Anaconda's interest to keep the price of copper down at present, so that the Arizona and New Mexico companies can more easily be brought to terms, and for that reason the Anaconda will not at present consent to sell copper at any fixed price."

Another dispatch from Boston, dated March 11th, says: A Boston man, representing important copper-mining interests both in Michigan and Montana, tells the *Transcript* that practically all that can be done is to make some such arrangement as that of the famous Interstate Railroad Association, generally known as "The Gentlemen's Agreement." If the copper producers of the country are convinced that the way to meet the present low and unprofitable state of the market for copper is by restricting production, and if they find the laws of Michigan or of the United States are against a combination as such, there is nothing left but a verbal agreement, based upon the honor of the gentlemen concerned. How such an arrangement would work is doubtful. Unless something is done, however, there will not be more than half a dozen mines in the whole country which can return dividends to stockholders. Producers generally understand this, but it is quite natural that the larger companies should not be so much concerned as the smaller ones.

A Wall-street journal says an agreement for the betterment of prices has been about perfected. From the corporations interested the following figures, which the respective companies agree to adhere to in the way of production during 1892, have been obtained: For Anaconda, 75,000,000 pounds; Calumet and Hecla, 60,000,000; Quincy, 12,000,000; Parrott, 14,000,000.

The allotments given in the figures quoted indicate a larger output than that of last year.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, March 12: I am happy to state that the mines hereabouts, after a short period of depression, are again on the improve. Drifting at the 900-foot level of the Wildman is finished, and they have almost cut through the ledge. They had explored the vein only a few feet when excellent rock was struck, showing free gold. As soon as they have reached the footwall, drifting on the ledge will be in order. Twenty stamps of the mill are hung up, to give them an opportunity to do some needed repairs in the shaft. The other 10 stamps are kept running on ore from the bottom level. At the South Eureka, Supt. Parks states the indications continue to improve as they go down. They are now down close on to 500 feet, and the formation is becoming softer. Although this is considered a good sign in many respects, it is objectionable to some extent on account of the greater pressure upon the timbers in the shaft. Surface work is still in progress at the Hector. Three or four men are running a tunnel, which furnishes a little ore, but the greater portion of milling material is taken from an old dump, and so easily ruined that but few men are required. Mr. Valentine has gone to San Francisco on business pertaining to the mine, and on his return it is reported that taking the water out of the shaft will be vigorously entered upon. The Lincoln is running on a small scale, but from all reports it is barely paying expenses. The Belmont is running on a limited scale also.

SOUTH SPRING HILL.—Amador Ledger, March 12: We are pleased to be able to state that this mine is again forging to the front as a hullion producer. At the 800-foot level running south, the vein shows 66 feet wide, over 40 feet of which is good milling ore. The outlook for a prosperous future is very bright. The great drawback to the proper development of this claim is the want of another shaft. There is only one shaft, and the mine has developed far away to the south of it, so that ore has to run 1200 feet underground before it can be hoisted. All this consumes time, and time means expenditure of money. The owners will no doubt, with the improvement of the mine, take immediate steps to the sinking of a new shaft.

AMADOR GOLD MINE.—Last Tuesday was the day set for the trial of J. P. Darling and other lien holders vs. Amador Gold Mine. The attorneys on both sides were on hand, and the court room was well filled with the numerous creditors, who were rejoiced at the prospect of a speedy termination of this long-standing suit. At the last moment, however, a new feature was injected into the case by another foreclosure suit of Jas. E. Dye, who has been in charge of the property in the interest of the English stockholders. The judge held that it was his duty to consolidate all lien suits, and ordered the last one consolidated with the others, and continued the trial until April 6th. There was a great deal of dissatisfaction felt at this delay, many believing that the suit was started simply for delay. It was reported that an agreement had been arrived at between the English and American stockholders for the settlement of all pending litigation, and by the terms of which the mine would pass into the hands of the American shareholders. This agreement, however, has not been definitely concluded yet, and it is by no means certain whether it will be carried out.

BAY STATE.—It is the intention of the directors of the Bay State company to commence prospecting for the ledge at the depth of 300 feet. The shaft is now down about 250 feet, and in two months it is expected that drifting will be inaugurated.

El Dorado.

ASBESTOS MINE.—Placer Republican, March 12: One of the most important items of interest during the week was the location of an asbestos mine in El Dorado county. The mine has been located by M. T. Lawrence, J. H. Richie, Daniel Kirby and William Houchin, of Auburn. It consists of a fine seven-foot ledge of a good quality of this mineral. The mine is located 16 miles from Auburn, a mile and a half from the American river, and about four miles from Greenwood. The fiber is used in the manufacture of fireproof roofing, and can be made into gloves or cloth which are incombustible; it is also used in the manufacture of iron safes and lampwicks. The writer has seen a sample of the mineral, which is very fibrous and of a gray color. Our townsmen have evidently struck a good thing.

Nevada.

CALIFORNIA SPECIMENS.—Grass Valley Telegraph, March 12: To-day at noon a Telegraph reporter was shown most handsome specimens of ore, literally filled with gold, taken from the California mine Friday afternoon. In fact, they surpass the magnificent ore taken from the California last summer and over which so much excitement was raised at that time. And the beauty of it all is the fact that there is every indication of the ledge being a permanent one, as it is in a settled country, at a depth of 200 feet from surface, that being the deepest prospecting ever done in the celebrated Deadman's Flat district. The specimens were taken from the hanging wall in the slope of the south drift, which has been traced for a distance of 80 feet and no signs are shown of its "petering out." The footwall ledge, while it does not contain so much gold, contains galena, black jack and other minerals, giving it a lively appearance. In the next level below, where work is actively going on, it is expected the hanging

and footwall ledges will come together, and then all the stockholders expect to become as rich as Croesus, for they believe they will then be in the famous McCook ground. Ore from the footwall ledge pays an average of \$20 per ton, and the mill is kept busy at work crushing the ore. There is every evidence that the California will soon be reckoned as one of our dividenders.

RICH ORE FROM THE CALIFORNIA.—Grass Valley Union, March 13: On Friday some very rich quartz was taken out of the south stope of the California mine, above the 200-foot level. No specimen rock has ever before been taken out of this portion of the mine, and it shows the existence of a pay shoot dipping south on the vein, which is the theory upon which the mine is being worked. The quartz taken out had streaks of heavy gold running through it, and mixed with galena and fine looking sulphurets. The quartz was also solid and of excellent appearance. There is no doubt felt but this pay shoot is going deeper, and will be struck in the 300 level, which is now being driven south. The find is in every way encouraging, and gives reason for the stockholders to believe that the mine is soon to be a reliable hullion producer. No quartz of equal value has ever before been taken from the mine.

Mono.

THE BULWER CON.—Bodie Miner, March 11: Nine hundred tons of ore have been crushed that yielded \$38,000. They have considerable more high grade ore on hand, which for the present will have to remain in the mine, on account of the Bodie Company requiring the mill to make a run of their own ore.

STANDARD.—The "Old Reliable" is turning out about \$20,000 every month, and under the able and efficient management of Supt. Leggett it will keep on doing so for years. It is reported on the street that a ledge of very rich ore has been struck lately in this mine.

SUMMIT.—About 100 tons of ore are on the dump and will soon be run through the Bodie mill. If satisfactory results be obtained, and there is every reason to believe that they will, arrangements will be made to run the mine on a larger scale.

SYNDICATE.—A large force of men is at work getting out ore of good quality. This has been a good mine and will continue to be so for some time to come.

Placer.

THE SWEET AND THE BITTER.—Grass Valley Union, March 13: If the coming Eastern editors are taken to Dutch Flat to see the mode of hydraulic mining for the extraction of gold, the Sutter Farmer suggests that they should also be shown the effects of such mining in filling the rivers with debris. There could be no objection to this. Let the editors understand the whole matter. The miners have no disguises to make, and are willing to admit that the debris has inflicted injury, but not to the extent claimed.

HARLOW.—Placer Argus, March 11: Secretary Everett paid a visit on Wednesday to the Harlow mine, three miles south of Loomis, and reports excellent results from the work being done there. The Harlow is a drift gravel mine, and some of the gravel absolutely cleans up \$1 in gold to the pound. They are working 20 men.

Plumas.

CLAYBANK.—Plumas National, March 12: The tunnel at Claybank mine, near La Porte, is being pushed ahead as fast as possible. The tunnel is now in over one mile. Very flattering reports come from the Thistle shaft. Owing to the recent rains, this company has been enabled to wash its dump pile. Gus Kuriz went up to his claim on the head of Rock creek, Tuesday. This is a placer claim. Last year, Gus took out several hundred dollars. He expects to do better this season. Bennett & Bell, who have part of the Leavitt drift mine leased, are in 100 feet with their tunnel and have good pay gravel. In former years this mine was immensely rich. Supervisor Nevill informs us that at the Little Jamison mine they struck it rich last Saturday. The tunnel is in between 1300 and 1400 feet, and the ledge has widened out considerably and prospects rich. They have between 75 and 80 feet of backs and are working some 23 men. Frank Thomas informs us that in starting a tunnel on the opposite side of the hill from the old Bell G. M. Co.'s tunnel, and when in only six feet, he struck a ledge three or four feet wide that shows free gold all through it and prospects rich. We heard, Friday, that Thompson & Kellogg had struck it rich in their tunnel at the Butterly ledge, this week. Charley Schneider came down from Meadow Valley, Friday. He was over on the East Branch a short time ago, and reports the boys all doing well. He says that at the Rush Creek Flat mine, owned by W. E. Duncan of Oroville, Henry Patten Supt., \$75 was taken out of three pans of gravel that was found while drifting. C. E. McLaughlin and Jake Stephan have leased the Golden Gate quartz mine from the owners for two years.

MINE LEASED.—Plumas Co. Bulletin, March 11: On Tuesday, C. E. McLaughlin and Jake Stephan leased the Golden Gate quartz mine from the owners, and are now making preparations to actively engage in working the property. It is their intention to erect, as soon as possible, a 10-stamp quartz mill which will enable them to work the mine on a much larger scale than heretofore. The mine, commonly known as the Jackson ledge, is situated about eight miles from Quincy, on the ridge north of Snake lake, and consists of two locations, thus giving 3000 feet of ground on the course of the vein. Last fall, a company did some development work and erected a 5-stamp mill which was operated at a great disadvantage, yet the ore yielded a goodly sum per ton. With the increased facilities which the lessees will have for working, we expect this property to become an important factor in the prosperity of this community. One of the owners says there are

now 3000 tons of ore in sight, and that over 1000 feet of the vein has been prospected, showing pay ore all along the ledge. The mine is so located that the ore is easy of extraction, and notwithstanding that it must be hauled about one-half of a mile, it can be mined and milled at a very reasonable figure, one that is sure to yield a good profit.

Sierra.

SIERRA CITY.—Mountain Messenger, March 12: The Rising Sun mining claim, a quarter of a mile below Sierra City, contains a good pay channel, 500 feet wide, 1200 feet long and an area of 38 acres. Three shafts were sunk from the bottom of the tunnel, in the channel, gravel prospecting \$1.50 to the pan. If this mine was thoroughly handled, it would be a good and permanent support to our town. The claim is owned by Samuel and Richard Uren and Antone Lewis. A half ounce nugget, from a foot square of the lead, was valued at \$9. Butte Saddle Co. have struck the second pay chute, for which they have been running and rock prospects well. Ledge is two and a half feet wide, and widening more. Distance from first to second chute, 500 feet.

Trinity.

CANON CREEK.—Trinity Journal, March 12: On our trip to Dedrick the first of this week we found work progressing slowly on most of the mines. The "Chloride" Company is running a tunnel through very hard rock to tap their ledge on the third level. They have got in 145 feet, having about 70 feet yet to run. The "Maple" Co. have tapped their ledge and are now running on it toward the shaft. When they get to a point under the old shaft they will raise up to get air. The ledge is looking very well, but an amount of work sufficient to determine the value of the mine has not yet been done.

Tuolumne.

WORK STOPPED.—Union Democrat, March 12: Operations on the Platt and Gilson mine, near Soulsbyville, have ceased, and it is very certain that work on the mine will not be resumed. The gentlemen owning the Platt and Gilson have purchased the Gerry-mander mine, situated near the Golden Gate, which they will have thoroughly prospected. It is to be hoped that this company will realize largely, for they have sunk \$120,000 in the Platt and Gilson mine, and still have abundant faith in the mineral wealth of this county. Messrs. Conlin & Graham will soon start up their mill on the Hilton & McPherson mine, near Saw Mill Flat. Lee R. McPherson has a force of miners at work, night and day, on his rich channel diggings recently opened up on the Vise Spring Ranch. Dave Levy, who is a heavy stockholder in Old Tuolumne mine, paid that property a visit of inspection, and reports himself as much pleased with the progress made by Supt. Davis. The tunnel is now in 1200 feet and they expect to strike the pay chute within the next four months. They will then have stopping ground on good rock for years, and which will amply compensate them for the large outlay they have made in development work.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—1500 level—Our work on this level during the week has been confined to prospecting. 1600 level—Are continuing the work of prospecting upward from the old sill floor. 1650 level—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 59 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from winze No. 3, 73 feet down, in working upward from that point. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality. There has been extracted from all parts of the mine during the week 977 650-2000 tons of ore, which were shipped to the Morgan mill. The average assay value of all the ore worked at that mill during the week (980 tons) was \$19.43 per ton. Bullion now on hand in our assay office, assay value about \$13,500.

OPHIR.—1465 level—The north drift started from the drift run west from the winze, 122 feet below the sill floor of the 1300 level, 80 feet west from the winze, has been advanced 4 feet; total length, 122 feet. From this drift, at a point 73 feet in from its mouth, an east crosscut has been advanced 11 feet; in porphyry and quartz of low assay value.

MEXICAN.—On the 1465 level the crosscut running east from the bottom of the winze sunk 101 feet down from the end of the crosscut run west 132 feet in from the main north lateral drift near the south boundary line of the mine, has been advanced 18 feet; face in very hard porphyry formation.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended 21 feet; total distance west from the shaft, 1740 feet. The face is in porphyry and streaks of quartz.

GOULD & CURRY.—200 level—Northwest drift, 435 feet west of shaft, has been extended 22 feet; total, 92 feet; face in porphyry. On the Suro tunnel level the joint north drift with the Savage Co. was advanced 21 feet; total length, 235 feet; face in soft porphyry.

BEST & BELCHER.—900 level—All work in west crosscut No. 1 for the week has been on repairs. Started an east crosscut from opposite west crosscut, and advanced same through porphyry, clay and stringers of quartz.

Osceola District.

WATER SUPPLY.—White Pine News, March 12: From a private letter received by a party here a few days ago, we learn that the Osceola Gravel M. Co. has just closed the purchase of W. T. Gregory, George Robinson and Robert Wilson's water rights, paying Gregory \$5000, Robinson \$3000 and Wilson \$3000 for his ranch and water right. This water is to supply in part the new

ditch the company made two years ago. The new ditch was made too high up the mountain to catch the water which runs in Lehman creek, hence the purchase.

Montgomery District.

A MILL.—Walker Lake Bulletin, March 12: It is said that negotiations have been in progress in San Francisco for some time past between George Montgomery, of "Breyfogle" fame, and George Crocker, for the purchase of the 40-stamp quartz mill of the State Line Mining Company located at Gold Mountain, in this county. If the sale is consummated, the mill will be removed to Montgomery, Nye county.

ARIZONA.

CASA GRANDE.—Phoenix Herald, March 12: Mr. Kellner met Mr. Thomas Phebe at Casa Grande by special appointment, on business connected with the Silver King mine. Mr. Phebe, a heavy mine owner of New Mexico, has bought a controlling interest in the mine and will move the mill up to the mine from the canal, and the mine will be worked with a good force. The mine will be worked from the upper level, as that has developed ore in better paying quantities than the lower one.

DOS CABEZAS.—Tombstone Epitaph, March 13: The Cooper mill debts have mostly been paid, and the soft-soled miners hired by the year have been turned adrift. Some of our local miners are now employed. The mill, it is expected, will soon be in operation. The old Rouse lode, which had considerable work done on it last summer, is idle at present. Mr. Lodge, who bought the Fowler and McGregor mill a year ago, has not returned from California yet. It is said he will move that mill to a point near the claim.

ANOTHER MILL COMING.—The cannon-ball mill, once at Buckhorn basin in the Chiricahua mountains, and which, later on, was taken to New Mexico by Judge Baker, is coming back to this district. A Colorado capitalist, connected in some way with the Cooper outfit, proposes to set it up on the northern slope of our mountains, which he regards as mere hills compared to the elevations he has been used to.

COLORADO.

CREEDE CAMP.—Associated Press dispatches, dated Creede, March 13th, are as follows: Any number of minor sales of mining interests from sums ranging from \$1000 to \$65,000 have been closed in the last few days, and still capital comes into the camp from all portions of the country. N. C. Creede has refused an offer of \$1,000,000 for his third interest in the Amethyst, on which, three months ago, he gave an option for \$75,000. Miners now here are arranging to put down diamond drills in five or six localities, and this will show up the mineral deposit. The snow is fast disappearing, making intelligent prospecting possible, and where a few weeks ago one man was on the hills, to-day there are 20. Ten-foot holes are by far in the majority in the camp, and until they go deeper, many will question the presence of much mineral outside of the producing veins. Ore shipments have fallen off slightly during the past week, while the Last Chance heaps up its daily output of about 90 tons. The Moses has not been up to its usual capacity because of the management turning its attention to development work and to getting in shape for stopping. The condition of the Burro trail from the Amethyst has been such that the output has not been so great, but this will all be made up when the tramway is built and the daily shipment increased to ten cars. The mining outlook is in a more healthy condition than ever before since the rush began. All agree that it is fast settling down and turning its attention to the hills and wealth which drew them here.

IDAHO.

DR. LAMAR.—Nugget, March 12: The hullion shipped from the De Lamar mine during the week consisted of six bars, valued at \$13,200. It is as regular as death and taxes. The west winze of the Stoddard mine is now down 100 feet, and a station is being cut out for the purpose of crosscutting the ledge. Where crosscut above, the vein was over 40 feet wide. On account of extremely bad air, the men working in the Garfield crosscut tunnel refused to work longer and were paid off this week. The tunnel is about 1100 feet in length, with no ventilation, and a delay will necessarily be made in driving the same, pending preparations for furnishing air, which it is hoped and believed will soon be completed. The strike made several days ago in the Belfast crosscut tunnel of the Phillips and Sullivan mine has turned out to be of more importance than at first reported. This tunnel cuts the vein much deeper than any former workings, and while the ore at this point is similar in character to the ore which has been taken out above, the ledge is 18 feet wide, four feet of it showing a high grade of free gold ore. On the hanging wall there is an iron clay streak 18 inches wide, and then over 12 feet of quartz which samples \$50 per ton in gold and a small amount in silver.

MONTANA.

BLUE BIRD.—Although the mine has been closed by attachment, in the opinion of many, the mill at least will be started up again in the near future under a new ownership. As to the mine, those in a position to know claim that the free-milling ore is exhausted and that nothing remains save base material, that can be successfully treated only by smelting. Of this fact, Ferdinand Van Zandt, the general manager, was aware, and with a view to overcoming the difficulty he organized the Butte Copper Company a short time ago, his intention being to acquire copper properties, erect a smelter and treat the base ore of the Blue Bird

along with the product of the copper ores. Among other copper interests secured, was a portion of the Ground Squirrel, located in the Kemper addition, and the J. T. C., which adjoins the Ground Squirrel on the west. The Squirrel blossomed out as one of the largest producers in the district, and the company had concluded to lift the bond it held upon it. A payment of \$50,000 was due on the first of the month, but instead of making the payment the interest was turned over to Marcus Daly of the Anaconda, who settled the indebtedness and took charge of the property. Like the Blue Bird, the Butte Copper Company, on which Van Zandt placed great hopes to retrieve the deficiencies of the former corporation, has collapsed, and, like the man who organized it and would have made it a success, will rise no more, as the properties from which it expected a supply of ore have already passed into the hands of other corporations.

THE MOUTON.—At 4 o'clock Saturday afternoon, the 20 stamps hung up at the Moulton mill about 10 days ago, on account of a scarcity of custom ore, were unlatched and began dropping on custom ore, a good supply of which has been secured by the company. The mill and mine are now in full blast.

NEW MEXICO.

DEVELOPMENT WORK.—Silver City *Enterprise*, March 11: The Key mill has been running for some time past on ore assorted from the old dumps of the Key mine. Hon. W. S. George has been engaged by the Maud S Company to make a thorough analytical test of the company's ores. The Key mill was sold Tuesday last under Sheriff's sale, and was purchased by one of the attaching creditors, Richard Boyle, for \$3,000. Tom Foster will start up the mill at Gold Hill, on ore from the Reservation, about the first of April, when several fine gold bricks will be turned out. Adam Clark, one of the old time prospectors of this section, is in the city. Adam is very sanguine of the mining future of this section, and thinks the people would be greatly surprised if they knew of a number of mining enterprises now being worked here. Nat Bell of the firm of Bell & Stephens, Pinos Altos, brought in yesterday 112 ounces of gold retort from 70 tons 800 pounds Pacific ore, milled by them during the week. Last week they produced 120 ounces gold from 70 tons Golden Rule ore. They never fail to add their quota to the bullion output of the county. Col. Dickson of Chicago, who is operating the St. Helene mine at Central, was interviewed yesterday by an *Enterprise* reporter, and kindly gave the following information in regard to the working of the property. The deepest working is by a shaft 110 feet; another shaft has attained a depth of 90 feet. The ore body averages 22 inches in width, and the average value \$22 per ton. A mill run of 50 tons is being made by the Grant County Mining and Milling Company, which will demonstrate how closely it may be milled by the free milling copper plate amalgamating process. Operations have been temporarily suspended on the mine, as the Colonel is adverse to throwing away profits on freight for hauling the ore ten miles, when all the natural facilities for milling are in the immediate vicinity of the mine. It is probable a mill will be built before operations are resumed on the mine, as a plentiful supply of ore for a mill has been developed.

OREGON.

THE MONUMENTAL.—Bedrock *Democrat*, March 12: Mr. A. W. Tabor of Granite, who was in the city yesterday, when asked by a *Democrat* reporter for some news regarding the mines of his section, referred to the Monumental mine now being operated by Mr. Chas. Miller, who, it may be said, has had unbounded faith in the wealth of the property in face of adversity, and now, after many years of litigation and other complications, he is in a fair way to see his long deferred hopes realized. Mr. Tabor says that in the 1200-foot tunnel constructed during the time the mine was under the control of the English company a ledge was crosscut, and recently Mr. Miller has run both ways on it and it has developed into a ten-inch vein of exceedingly high grade ore, and it is thought to be a stringer to the main ledge. The ore being taken out in the prosecution of the work to reach the mother lode is being delivered at the Monumental mill and its reduction will soon be made.

UTAH.

TO DRY AND ROAST.—Park *Record*, March 12: Arrangements are being perfected for putting in a Stedefeldt gas plant for drying and roasting ores at the Ontario mill. The plant will be located on the site of the big stack now being torn down, and will be applied first on the No. 2 side of the mill. Mr. Stedefeldt will have full charge of the construction and the foundation is now being put in. This step is rendered necessary on account of the growing scarcity, and consequently high price, of wood. The Apex mine is in a quandary. Its rich ore above the tunnel level is becoming exhausted, and the company dares not go below that for fear of water. There is a big mine there, if machinery was put in capable of handling the large volume of water.

IT IS A MINE.—Rosscamp & Glenn are working hard on their recent discovery on the west side of Thayne's canyon. The vein is opening up quite favorably and gives every indication of becoming a paying mine. The vein is six feet wide and was encountered in the long tunnel started by them last summer, after driving a distance of 190 feet. The vein is nearly all ore and they have about 60 tons on the dump, and say they will be able to ship about 200 tons as soon as the roads get in shape for hauling.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING MARCH 8, 1892.
470,537.—FLY SCARE—J. C. Baker, Butte City, Mont.
470,176.—MECHANICAL MOVEMENT—F. P. Burkhardt, Spokane Falls, Wash.
470,546.—HEAT REGULATOR FOR COOKING STOVES—Virginia M. Cone, Alameda, Cal.
470,618.—ADJUSTABLE CLUTCH—D. W. Freeman, Fishhawk, Or.
470,565.—STEAM EXCAVATOR—I. N. Hennessy, Ilwaco, Wash.
470,571.—HYDRANT VALVE—J. D. Hooker, Los Angeles, Cal.
470,575.—CAN-CAPPING MACHINE—M. Jensen, Astoria, Or.
470,495.—WHEEL PLOW—Lamborn & Rickards, Dixon, Cal.
470,502.—CULTIVATOR—D. F. Oliver, Oakland, Cal.
470,211.—DENTAL MOUTH MIRROR—R. F. Phillips, San Diego, Cal.
470,366.—FRUIT JAR—F. A. Potter, S. F.
470,505.—ELECTRIC CAR BRAKE—J. Redmond, Seattle, Wash.
470,600.—HOP PRESS—P. Riggs, Crowley, Or.
470,272.—TIME VALVE—H. Vignere, San Diego, Cal.
470,565.—CAN-CAPPING MACHINE—Wm. Wedgwood, S. F.

The following brief list by telegraph, for March 15 will appear more complete on receipt of mail advices:

California—Washington Berry, Angel Island, sash balance; Calvin C. Bowen, San Francisco, manuscript holder for speakers and device for moving and displaying speakers' manuscripts; Darwla Livermore, Los Gatos, sash fastener (reissue); Alexander W. MacArthur, San Francisco, winter game apparatus; George W. Merk, San Francisco, cooking utensil; Adolph Sommer, Berkeley, solution of lactic acids in oils and fats and dissolving lactic acids in oils and fats; Herman Welsh, San Diego, adjustable pick-point. Designs—Augusta M. Warner, San Francisco, game board. Oregon—Joseph Bell, Troutdale, feed water heater; John B. Mohana, Freewater, locomotive. Arizona—Joseph H. Himilil, Globe, fountain attachment for inkstand.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FLY SCARE.—Jonathan C. Baker, Butte City, Montana. No. 470,537. Dated March 8, 1892. The object of this invention is to provide a general system for frightening flies, especially adapted for use in restaurants and dining halls, said system being arranged and its operation effected in a simple but effective manner. The fly scare consists of a plural number of sets of strings connected into a single system, said strings crossing each other at an angle and being connected with each other at their points of intersection. Rubber bands are attached to the ends of the strings, whereby they are supported from the walls of the apartment. A motor is secured to the end of one string of the system, and by it the whole system is moved back and forth. Agitators are suspended from the strings, and by these the insects are frightened away and will not settle on the tables.

CAN-CAPPING MACHINE.—Wm. Wedgwood, San Francisco. No. 470,368. Dated March 8, 1892. This can-handling machine is intended to present a succession of revolving cans to the operator in order to solder their caps. The object is to provide a rapidly operating machine for carrying into position before the operator a series of cans which are caused to revolve, whereby they may be properly subjected to the soldering iron to secure their caps.

CULTIVATOR.—Doctor Franklin Oliver, Oakland. No. 470,502. Dated March 8, 1892. This invention relates to that class of wheeled cultivators in which the frame is adapted to be raised and lowered by connections with a rocking axle. The object of the invention is to provide a simple and strong cultivator, easy and accurate of adjustment to regulate its teeth either in or above the ground and in the frame of which the teeth may be readily placed and varied both as to number and position.

FRUIT JAR.—Francis A. Potter, S. F., assignor to one-half to G. W. and Wm. Dieffenbacher. No. 470,366. Dated March 8, 1892. This is a glass jar formed with a flange surrounding its orifice and an exterior ledge, a separate hand or ring secured to the periphery of the jar and bounding the ledge, and a glass cover with its rim fitting down over the orifice flange into the annular channel formed between said flange and ring or band, said rim resting on the ledge and raising the cover above and free of the orifice flange. For hermetically sealed goods, it is very desirable to use glass jars and glass covers. The difficulty has been to make a glass cover fit tightly to a glass jar, and especially to one having a large mouth or opening; and in those cases in which this result has been attained, another difficulty has presented itself, namely, that of getting the cover off. The object of this invention is to provide a simple and practicable construction whereby a glass cover can be tightly fitted and sealed to a glass jar and can be easily removed when desired, said jar having also as wide a mouth or opening as may be required.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized.

The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. B. EVERETT.....Ass't Secretary.
H. PICHON.....Treasurer.

VICE-PRESIDENTS.

NAME.	COUNTY.
R. F. Grigsby.....	Napa
Henry Martin.....	Trinity
Geo. W. Thomas.....	Martin
Frank R. Wehe.....	Sierra
Woolston Banghart.....	San Mateo
R. H. Campbell.....	Siskiyou
Jas. O'Brien.....	Yuba
Frank Fitzgerald.....	Inyo
A. B. Call.....	Amador
Dixon Brabban.....	Plumas
J. F. Ryan.....	Humboldt
Aaron Bell.....	Shasta
H. O. Harvey.....	Sacramento
D. K. Perkins.....	Butte
A. M. Hardle.....	San Luis Obispo
A. Tregidgo.....	Nevada
Ex-Gov. H. G. Blaisdell.....	Alameda
T. B. Morse.....	Calaveras
Hon. A. M. Clark.....	Fresno
Hon. J. K. Luttrell.....	Sonoma
J. Crawford.....	El Dorado
R. M. Folger.....	Mono
Geo. F. Hoyte.....	Orange
R. McMurray.....	San Francisco
W. S. Chapman.....	San Francisco
I. C. Stump.....	San Francisco
C. T. Lacy.....	San Francisco
J. C. Ralston.....	San Francisco
John W. Maxwell.....	Tuolumne
Hon. R. Clark.....	Colusa
C. F. Reed.....	Placer
Chas. Bogan.....	Mariposa
James H. Lawrence.....	Merced

EXECUTIVE COMMITTEE.

Hon. J. H. Neff, Placer.	H. A. McCrancy, Lake.
Louis Glass, San Francisco.	Jas. Tunstead, Marin.
Ool. Dan M. Burns, S. F.	A. M. Bryant, Mono.
Col. F. McLaughlin, Butte.	W. K. Aldersley, Napa.
S. K. Thornton, S. F.	Chas. Bogan, Mariposa.
Wm. Irelan Jr., S. F.	Jas. H. Lawrence, Merced.
Hon. W. O. Cross, Nevada.	Hon. J. M. Walling, Nevada.
Chas. G. Yale, San Francisco.	D. O. Pixley, Orange.
J. B. Hobson, Placer.	John Spaulding, Placer.
Hon. Edw. Coleman, Nevada.	W. W. Kellogg, Plumas.
Hon. A. Walrath, S. F.	M. M. Drew, Sacramento.
Hon. J. K. Luttrell, Sonoma.	Thos. R. Church, S. F.
Ex-Gov. H. G. Blaisdell, Ala.	John Hays Hammond, S. F.
meda.	Myron Angel, S. L. Obispo.
Hon. Jno. Daggett, Siskiyou.	N. J. Brittan, San Mateo.
Hon. E. O. Voorheis, Amador.	George M. Pinney, Sierra.
E. W. Fogg, Butte.	R. G. Hart, Shasta.
John F. Davis, Calaveras.	A. W. Dana, Sonoma.
John Boggs, Colusa.	A. Hewell, Stanislaus.
Hon. Thos. Fraser, El Dorado.	C. P. Berry, Sutter.
Mr. McDonald, Fresno.	C. McFarahan, Tuolumne.
W. H. Pratt, Humboldt.	G. O. Kinball, Tehama.
Hon. Patrick Reddy, Inyo.	John McMurray, Trinity.
J. O. Miller, Kern.	O. G. Mayo, Yuba.

FINANCE COMMITTEE.

Louis Glass, San Francisco	Edward Coleman, Grass Valley.
Wm. Irelan Jr., S. F.	S. K. Thornton, S. F.
N. J. Brittan, San Mateo.	John Hays Hammond, S. F.

COMMITTEE TO FORMULATE AND PROMOTE THE ADOPTION OF AMENDMENTS TO MINING STATUTES.

Hon. Niles Searles, of Nev.	J. M. Fulweiler, Placer.
vada.	H. I. Thornton, S. F.
Hon. O. W. Cross, S. F.	Hon. J. K. Luttrell, Sonoma.

COMMITTEE OF CONFERENCE WITH RIVER AND HARBOR CONVENTION COMMITTEE.

R. G. Hart, Shasta.	Wm. Irelan Jr., S. F.
Frank McLaughlin, Butte.	J. B. Hobson, Placer.
Hon. J. K. Luttrell, Sonoma.	

DELEGATES TO WASHINGTON.

Hon. Niles Searles, of Nevada County.	
Hon. J. K. Luttrell, of Sonoma County.	
Robert McMurray, of Nevada County.	
J. B. Hobson, of Placer County.	

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

Sec. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

Sec. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

Sec. 3. The President and Secretary of this Association shall be ex officio President and Secretary of the Executive Committee.

tion shall be ex officio President and Secretary of the Executive Committee.

Sec. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

Sec. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

Sec. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

Sec. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by this President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at this city and county of San Francisco.

Sec. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

Sec. 3. All persons friendly to the mining interests are eligible to become members of this Association. In this event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

Sec. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittees as they may determine. They shall fill all vacancies of the officers of the Association or members of any committees. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

Sec. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

Sec. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

Sec. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

Sec. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

Sec. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of such intended meeting.

Sec. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

MECHANICAL PROGRESS.

Educate the Mind as Well as the Hand.

We find the following good advice to mechanics in the *Manufacturers' Gazette*: Every man who is engaged in any kind of mechanical labor should cultivate studious and observant habits. There is scarcely any description of knowledge but which he will at some time have use for, especially if he ever hopes to rise above the position of ordinary mechanical labor. No man can ever hope to attain distinction as a mechanic unless he educates his mind as well as his hands.

One of the most important acquirements of a mechanic is that he should be able to readily and lucidly convey ideas to another. There are, indeed, many men who, while otherwise competent to direct others, have failed from lack of this faculty, or have refused good positions because they know their weakness in this respect. Perhaps as many foremen fail from this cause as from any other. Undoubtedly this faculty is one to be acquired; it is not one, if there are such, that is born with a man. Every man who works at a mechanical business should labor in the direction of acquiring the habit of concisely expressing his ideas, making this a part of his mechanical education. Talking of such subjects will help a man; writing of them is excellent practice.

A good mechanical eye is also a most essential requisite in a good mechanic. No one can ever attain distinction as a mechanic unless he is able to detect ordinary imperfections at sight, so that he can see if things are out of plumb, out of level, out of square and out of proper shape, and unless he can also detect disproportioned or ill-shaped patterns. This is a great mechanical attainment, and one which can be readily attained by any ordinary person. Of course there are defective eyes, as there are other defective organs; the speech, for instance, is sometimes defective, but the eye is susceptible of the same training as any organ. The muscles, the voice, the sense of hearing, all require training. Consider how the artist must train the organ of sight in order to detect the slightest imperfection in shade, color, proportion, shape, expression, etc. Not one blacksmith in five ever attains the art of hammering square, yet it is very essential in his occupation. It is simply because he allows himself to get into a careless habit; a little training and care is all that is necessary for success. But in these cases the fact is that the eye is not half as much at fault as the heedless mind. Some carpenters acquire the careless habit of using a tri-square every time they plane off a shaving, in place of giving their minds right to their business and properly training their eyes, and unless they cultivate this power of the eye, they will always be at journey work.

Look at the well-trained blacksmith. He goes across the shop, picks up the horse's foot, takes a squint, returns to his anvil, forges the shoe, and it exactly fits the foot. Contrast him with the bungler who looks at the foot, then forges a shoe, then fits the foot to it, often to the ruin of a fine horse. Now, the fault lies in ever allowing himself to put a shoe on that is not in proper shape for the foot. He should determine to make the shoe fit the foot in place of the foot fitting the shoe, and he should follow it up until the object is accomplished.

A very good way to discipline the mechanical eye is to first measure an inch with the eye, then prove it with the rule, then measure a half-inch, then an eighth, and so on, and you will soon be able to discover at a glance the difference between a twelfth and a sixteenth of an inch; then go to 3 inches, 6, 12 and so on. Some call this guessing; there is no guesswork about it. It is measuring with the eye and mind. Acquire the habit of criticising for imperfections every piece of work that you see; do everything as nearly as you can without measuring (or spoiling it), or as nearly as you can trust the eye with its present training. If you cannot see things mechanically, do not blame the eye for it; it is no more to blame than the mouth is because we cannot read, or the fingers because we cannot write. A person may write a very good hand with the eyes closed, the mind, of course, directing the fingers. The eye is necessary, however, to detect imperfections. Every occupation in life requires a mechanically trained eye, and we should realize more than we do the great importance of properly training that organ.

MUST WE SAY GOOD-BYE TO PUDDLED IRON?—The English correspondent to the *American Manufacturer* answers the above

query as follows: Not yet; but the time is coming when we shall have to. Such is the view taken by Mr. Trow, the operative Secretary of the North of England Board, at the annual meeting above referred to, and in support of his contention he pointed to the manner in which puddling furnaces were dwindling in number, there being now 5000 in the North of England compared with 7000 some years ago. The President of the Board, Mr. Whitwell, had first previously expressed similar views upon the same subject. He went so far, indeed, as to declare that the iron age was gone, and, correctly enough, assumed that we must all be keenly alive to the fact that we were coming to the age of steel. "We are told," continued the President, "that steel can now be made cheaper than iron, in quantities, and with less labor. It is satisfactory to reflect that life, in the long run, will be safer with steel than it has ever been with iron." And then, alluding to the great North of England shipbuilding industries, he added: "We see enormous vessels now built of new material, and we note with satisfaction that the number of orders in the shipyards for ships of steel will give work for some time to come, though this will mean the displacement of the older class of vessels."

CAST IRON.—Mr. Thomas Turner recently delivered a lecture on metallurgy in Birmingham, England, in which he remarked that, as the applications of cast iron are almost indefinitely numerous, and, despite the competition of steel, appear to increase rather than diminish, the difference in form and variety of molds is very great. The most general material used for molding is green sand, a black mixture to be found in every foundry, and which gets its name from the fact that it is used in the raw or unbaked condition. For special purposes, dry sand, loam or cast-iron molds are needed, but the Staffordshire district is famous for green sand molding for brass, iron and other metals, and for the improvements in details which have been introduced in order to allow of the production of a large number of the same class of patterns in the shortest time. Molding machines are now being rapidly introduced into many branches of the trade where there is much repetition of simple forms, and it is stated that by this means the cost of moulding can, in some cases, be reduced to about one-sixth of what it formerly cost. The effect of remelting cast iron varies with the character of the metal and with the method of melting. It has been frequently supposed that iron was improved by being melted and kept in the fluid condition, but Mr. Turner's analyses of the test pieces prepared by Sir W. Fairbairn have shown that the effects obtained can be fully explained by the chemical changes that took place, and that the metal loses silicon and absorbs sulphur when it is remelted in the cupola or air furnace. This makes the iron harder, and if it were originally too soft, improves it, while if the metal were too hard at first, every melting only makes it worse. The properties of cast iron are not altered when it is melted in a closed vessel, so as to prevent chemical change.

DIFFERENCE IN THE COST OF GUN-MAKING.—The following may be of interest in connection with the proposed establishment of gun-making plants on this coast: The recent statement submitted to Congress by the Ordnance Bureau of the War Department is interesting as showing the relative cost of making guns at Watervliet and the Washington Navy Yard. The cost of the first 12-inch gun built for the navy was, according to a recently published statement, \$46,476, of which \$41,140.79 was the cost of the forgings and \$5335.21 the cost of finishing and assembling. The first army 12-inch gun cost \$79,426.80, of which \$57,032.80 was for the forgings and \$22,394 for assembling and finishing. The difference in the cost is largely explained by the fact that the navy has had much more experience in the building of large guns than the army, and the forgings for the army gun were bought abroad, while those for the navy weapon were made by the Bethlehem Iron Works.

DOUBLE-SHEAR STEEL.—In order to test the value of analyses, a Sheffield steel manufacturer has bored a bar of double-shear steel, divided it into three equal parts, and forwarded the same for analysis to a gentleman concerned in metallurgy. He has received three varying reports as to the component parts of the same article. He holds to the opinion that no one but the manufacturers who have the secret know exactly how to produce "double-shear steel." The experiment of the analyst is exercising more minds than those of the manufacturers locally affected.

SCIENTIFIC PROGRESS.

What Is Electricity?

The above question is often asked, and many have been the attempts to answer it. With this uncertainty among scientists in general, the average man will be glad to know that even such an authority as Prof. William Crookes, President of the Institution of Electrical Engineers, England, is yet in doubt as to the various theories advanced to explain electric phenomena. He says: "We know little as yet concerning the mighty agency of electricity." In his recent presidential address there is much of interest to the engineer, and we quote the following from the *Railroad Gazette*:

"We have happily outgrown the preposterous notion that research in any department of science is mere waste of time. It is now generally admitted that pure science, irrespective of practical applications, benefits both the investigator himself and greatly enriches the community. 'It blesseth him that gives and him that takes.' Between the frog's leg quivering on Galvani's work table and the successful telegraph or telephone there exists a direct affiliation. Without the one we could not have the other.

"We know little as yet concerning the mighty agency of electricity. 'Substantialists' tell us it is a kind of matter. Others view it, not as matter, but as a form of energy. Others, again, reject both these views. Prof. Lodge considers it 'a form or rather a mode of manifestation of the ether.' Prof. Nikola Tesla demurs to the view of Prof. Lodge, but thinks that 'nothing stands in the way of our calling electricity ether associated with matter, or bound ether.' High authorities cannot even yet agree whether we have one electricity or two opposite electricities. The only way to tackle the difficulty is to persevere in experiment and observation. If we never learn what electricity is, if, like life or like matter, it should remain an unknown quantity, we shall assuredly discover more about its attributes and its functions.

"Experimentalists are reducing the wave lengths of the electrical rays. With every diminution in size of the apparatus the wave lengths get shorter, and could we construct Leyden jars of molecular dimensions, the rays might fall within the narrow limits of visibility. We do not yet know how the molecule could be got to act as a Leyden jar, yet it is not improbable that the discontinuous phosphorescent light emitted from certain of the rare earths, when excited by a high tension current in a high vacuum, is really an artificial production of these electrical rays, sufficiently short to affect our organs of sight. If such a light could be produced more easily and more regularly, it would be far more economical than light from a flame or from the arc, as very little of the energy in play is expended in the form of heat rays. Of such production of light, nature supplies us with examples in the glow worms and the fireflies. Their light, though sufficiently energetic to be seen at a considerable distance, is accompanied by no liberation of heat capable of detection by our most delicate instruments.

"Alternating currents have at the best a rather doubtful reputation, but it follows from Tesla's researches that as the rapidity of the alteration increases they become not more dangerous, but less so. It further appears that a true flame can now be produced without chemical aid—a flame which yields light and heat without the consumption of material and without any chemical process. To this end we require improved methods for producing excessively frequent alternations and enormous potentials. Shall we be able to obtain these by tapping the ether? If so, we may view the prospective exhaustion of our coal fields with indifference. We shall at once solve the smoke question, and thus dissolve all possible coal rings. * * * Electricity seems destined to annex the whole field, not merely of optics, but probably also of thermotics. * * * Rays of light will not pass through a wall, nor, as we know only too well, through a dense fog. But electrical rays of a foot or two wave length, of which we have spoken, will easily pierce such mediums, which for them will be transparent."

IS THE NEW JENA GLASS A FAILURE?—A photographic contemporary announces the fact, with some show of importance, that Mr. Berthiot of Paris has made a lens of the new Jena glass of a focal length of nine inches, which will sharply cover a plate 6½ by 4¾ inches, at an intensity of 1-11. He fails to find anything remarkable in this fact, and thinks it is only another proof that the new Jena glass which was heralded with so great a flourish, has failed as yet to do any-

thing toward the improvement in construction of the photographic lenses. There is no question, however, that when the makers succeed in overcoming its hygroscopic nature, there is a considerable future in store for this glass for photographic lenses, but the necessity that arises at present for sacrificing it between harder elements, makes "the game not worth the candle."

Cloud Rain.

Mr. John Aitken, the well-known meteorological investigator, to whom we are indebted for the discovery of several fundamental facts in connection with the formation of fogs and dew, has been investigating clouds from the summit of the Rigi and Pilatus. He now finds, as in former observations, that fog is intimately dependent on the presence of dust particles in the air, each of the invisible granules forming the nucleus of a tiny head of water, these vesicles constituting in the aggregate clouds, mists, and their kindred. At elevated situations the air is comparatively free from dust, while lower down it is full of it. But while clouds are passing over a peak the number of particles varies considerably. This, he discovers by a series of carefully compiled data, is due to the fact that the air entering into the clouds has forced itself up from the valley below. Hence the mountain air is pure or impure in exact accordance with the amount of the lower current which has reached it. When the cloud vanishes, the ether resumes its old composition.

Another curious fact just discovered by the same indefatigable observer is that the moment a cloud forms, it begins to discharge its contents in the shape of a steady shower of minute drops. These drops are not capable of being appreciated by the unassisted senses; but by the "fog counter," an instrument of Mr. Aitken's invention, the exact number falling on a given space can be readily noted. What is still more curious is that though the air is in such circumstances saturated with damp, seeds, stones, and other large objects near the earth are perfectly dry, the drops being evaporated by the radiant heat of the ground; but a pin's head or other small object, not offering the same area, is in these circumstances often covered with a minute globule of water. The fact of a cloud thus beginning to rain small drops whenever it is formed may account for the disappearance of these vaporuous masses by gradual exhaustion, without any change in the wind or temperature.—Scientific American.

CAN SOUND BE PRODUCED BY COLOR WAVES?—It is said that certain scientists are just now very much interested in what is claimed to be a new scientific phenomena. Briefly, a beam of sunlight is made to pass through a prism, so as to produce what is called the solar spectrum, or rainbow. On placing the ear to a vessel containing silk, wool or other similar material, upon which the colored lights are made to fall, distinct sounds are heard. Thus, if the vessel contain red worsted, and the green light flashes upon it, loud sounds will be given, but only feeble sounds when the red and blue parts of the rainbow fall upon the vessel, and other colors make no sound at all; in a word, every kind of material gives more or less sound in different colors, and utters no sound in others.

ATMOSPHERIC PRESSURE.—A man weighs less when the barometer is high, notwithstanding the fact that the atmospheric pressure on him is more than when the barometer is low. As the pressure of air on the ordinary-sized man is about 15 tons, the rise of the mercury from 29 to 31 inches adds about one ton to the load he has to carry.

JUPITER'S MARKINGS.—The red color of the markings on Jupiter is believed by Mr. Barnard, the eminent astronomer, to be an indication of their age, the spots of markings (other than the white spots) being dark or black on first appearance, but afterward becoming red. The great red spot seems to be no exception to the rule.

EXPANSIBILITY OF THE ATMOSPHERE.—A cubic inch of air taken 4000 miles above the earth's surface would expand sufficiently to fill a sphere 2,000,000 miles in diameter. By the same law, if a well could be dug to the depth of 46 miles, the density of the air at the bottom would be as great as that of quicksilver.

A NATURAL CEMENT.—A discovery of great importance to South Africa is a stone capable of being burned into a natural cement of good quality. The deposit covers 1000 acres, and varies in thickness from 10 to 20 feet.

ELECTRICITY.

The Electric Lighter.

One of the most delightful of the minor accessories that electricity furnishes to the household is the newly invented "electric lighter." This is a beautiful ornament for the parlor, dining-room or chamber, always instantly responsive to a call for light, and of valuable service in other ways to the family.

It is operated by pressing the little button, when the light instantly appears. It is made of highly polished nickel plate, is but six inches high, and occupies only six square inches on the table or mantel. Its construction is so simple it can be readily taken to pieces and as easily readjusted to working order. It needs no wires or connections, the current of electricity being generated by chemical action within the cylinder. It is perfectly safe, always secure, and a child can operate it.

The material used in the battery is sold by every druggist, and a charge costing but ten cents is sufficient to keep it in constant service for 30 to 60 days. With usual care, it will last a lifetime, and if it should become disabled by an unfortunate tumble, any damaged part can be replaced at trifling expense. Its construction is so handsome and ornamental that it will readily find its place among the bric-a-brac of the choicest apartments, and is easily portable from room to room.

It will be found a most desirable companion for the merchant or lawyer in his office, the professional man in his study, the student in his lodgings, as well as the housewife, and its neatness and quick responsiveness will recommend it to all.

It is manufactured and sold by the Barr Electric Manufacturing Co. at No. 17 Broadway, New York. The price is \$5—a veritable trifle when its beauty and service are considered.

Though originally designed simply for a lighter, it has been found practicable to add several useful accessories. A medical coil with hand electrodes can be readily attached, by which gentle or sharp electric shocks can be given to a member of the family afflicted with nervous affections, rheumatism, neuralgia, lumbago, sciatica, headache, etc. This attachment can also be connected by wire to the doors and windows of the house, thus providing the homestead with a complete and perfectly reliable electric burglar alarm; or if in a city, it can be connected with a street wire to the nearest police station. The price of the medical coil is \$3.50.

Another adjunct is the call bell, which is also easily adjustable and operated by pushing down the central rod, as in a dinner table or call bell. The price of this, with 100 feet of wire, is but \$1.25.—Ex.

ELECTRICITY IN MINING.—A Placerville correspondent of the *Sacramento Record-Union* says: "The Dalmatia Mining Co. of Kelsey, an English corporation, has recently harnessed into service the heretofore wasted energies of nature by utilizing the mountain stream flowing past its works. By the use of electricity, it has been enabled to work its output of ore at an expense of only 47 cents per ton, inclusive of everything, up to the time the gold reaches the plates. This wonderful reduction in the cost of operating mines has given a great impetus to the hitherto languishing quartz and gravel interest in that section, and leads to the belief that the next season will be one of greater prosperity than any in the record of quartz mining in that locality." A great saving in mining operations, by the substitution of electricity for steam, is reported to have been realized at the Virginus mine, near Ouray, Colorado. It is said that it formerly cost \$15 per ton for coal with which to operate this mine, as all fuel had to be transported up the mountains on burros. The cost of coal reached \$100 per day, or an aggregate annual expense of \$36,000 for fuel alone. Every cent of this heavy running expense is now saved to the mine owners. The new operating force of the Virginus is water power transmitted by dynamos located at Red Canyon creek, four miles from the mine. In England, says the *Newcastle Journal*, considerable interest is being evinced in mining circles generally, as to the result of an important electric mining installation at one of the Earl of Durham's collieries, which, when finished, will be the largest and most complete electric mining plant as yet erected in England. The operations to be effected consist of electric haulage, winding, pumping, lighting, etc.

ELECTRIC POWER STATIONS IN GERMANY.—In Germany, considerable attention is being paid at present to electric

power stations. In the eastern part of the Empire there are a great many fine water power locations which can be used to great advantage in developing electric power. A number of companies has been formed for that purpose, among which is the *Societe Industrielle* of Mulhouse, Alsace. This company has offered a medal and prize of about \$500 for the best memoir on the subject of distribution of power from a central station having special regard to the industrial district of Upper Alsace.

HOME-MADE ELECTRICITY.—A French chemist is said to have devised a method by which the common stove may be used as a generator of electric light for the house, as well as for heating it and cooking for the family. The *Philadelphia Record* says: "A French chemist, who has been giving considerable attention to the problem of heating and lighting from a single source, has devised a novel stove, which in appearance resembles an ordinary heating stove. It is so arranged internally that the waste heat is utilized for the generation of electricity. This is secured by a number of rectangular boxes of sheet iron, containing the necessary metallic elements for furnishing the current. These elements are insulated by asbestos, and the cooling is effected partly by the shape in which the metallic alloys are cast and partly by a circulation of air. The current obtained is not great in amounts, but the result of this attempt seems to be favorable. Accumulators are used for storing up the electricity, and as the heating is required for a much longer period than for lighting, the electrical energy, which would be lost during the hours of daylight, is saved. A point of considerable moment is that the heat utilized in this way is waste heat, so that any portion that can be recovered in the form of electricity is so much gain."

HEATING BY ELECTRICITY.—The *Electric Review* says: "Heating by electricity seems to be making considerable headway toward a more popular use, notwithstanding it is more expensive than any of the older forms. It is combating the same objection that the electric light met with in its early days, but unquestionably it is a much more desirable method for most uses, and will surely grow in favor. It is somewhat of a luxury at present, but as the cost of the electric current is reduced, and each year has seen an improvement in that direction, due to the use of more economical machinery and methods, it will soon reach a point of economy where its more general adoption for general purposes will be feasible." An Eastern exchange, in referring to the above, says: "This important problem is claiming the attention of electricians. The smoke nuisance in the larger cities has caused a demand for other means of supplying heat than by the use of coal. Pittsburgh was changed from one of the most undesirable places in which to live or transact business into one of the most delightful by the change from coal to gas. The dense clouds of smoke which hang over Cincinnati, shutting out the sun and making the air unfit to breathe, would be removed to a great extent by the use of electricity for heating, and other cities would be equally benefited."

ELECTRICITY AT THE WORLD'S FAIR.—It is said that Prof. Barrett is in a quandary. Electricians are calling for more room than the World's Fair electricity building has. There are just 207,000 square feet of space to divide. Germany and England have each been assigned 20,000 square feet, and France will use the same area. American firms have already applied for 200,000 square feet, and more applications are coming in daily. There will evidently be no lack of exhibits in the branch of electricity, at least.

A CURIOUS RESULT has followed the introduction of electricity for street-lighting in Orizaba, Mexico. Millions of insects have been attracted from the mountains, and their dead bodies have collected in great heaps about the lamp posts. Under a hot sun, an unbearable stench has risen from the decaying masses, and fever has broken out among the inhabitants. It has been found necessary to send out wagons every morning to carry away the dead insects.

MOUSE POWER.—A "two mouse power" electric motor and battery is being introduced by the Electro Novelty Co., 9 Knapp street, Boston. The little machine is said to be a perfect working model of the Edison dynamo.

CAST AND MALLEABLE IRON IN THE SAME STRUCTURE.—It has recently been proved that when cast and malleable iron are used in the same structure a galvanic action is set up between them and the malleable iron is corroded.

USEFUL INFORMATION.

TEA CHEST LEAD.—Quite an industry appears to be growing up in New York and Boston, where large quantities of tea is imported, in connection with the mattings with which the boxes are enveloped and the lead lining which is placed between the box and its contents. The mattings are mostly baled and shipped to London, where they enter into various uses. They are also used to a considerable extent in this country. In regard to the lead linings a much larger use is made. China has been noted from all time for the purity of its lead and the great value of its lead mines, and this tea chest lead, as it is called, is regarded as the finest in existence. It commands five cents and upward a pound, and finds ready buyers. There are many uses for it, and it is especially valuable in making the best kinds of solder. It is excellent in preserving furs and delicate fabrics, and is much sought for by military and naval men in which to wrap their dress uniforms, for it not only preserves the cloth, but prevents the gold ornaments from tarnishing. One would think that, where so much of this sheet lead is made use of as in China, there would be machinery employed in its production; but such is not the case, and every sheet of it is made by hand and in the most primitive fashion. A large brick is provided, the size of the sheet of lead to be made, and this brick is covered with two or three sheets of paper. On this paper the molten lead is poured, and another brick is placed on top, which flattens the lead out to the required size and thinness. The sheets are then soldered together to the size of the interior of the tea chest, the tea packed in and the top sheet fastened in place. The workmen are very expert, and turn out a vast number of sheets in the course of the day, and where labor is so cheap, at a price much less than it could be made by machinery.

SUGAR IN MORTAR.—A correspondent of the *Scientific American* writes that journal from Big Stone Gap, Virginia, as follows: "I wrote to you some time ago for a paper giving information about using sugar in plastering mortar; you sent me one, but the article in it did not suit our case, so we determined to experiment on it. Thinking the result of experiment may be of some use to you or your readers, we will send it. We use the cheapest grade of beet sugar, costing here four cents a pound, and all lumps must be mashed up before putting in the mortar. The mortar must be dry or "stiff" when the sugar is put in, as it makes it very soft when mixed thoroughly. We put the sugar in when we temper it for putting on the walls, and put it in the hair mortar only, or first coat, and use about 40 pounds sugar to the 100 yards. It is a little harder to put on than without sugar. But the result is, we have a wall that cannot be easily damaged. We can draw a trowel corner over it, and bearing on hard can merely mark it. It does not crack by pounding on it, nor can the clinches be easily broken off. It does not color the white coat any, and we can find no fault with it, while on the other hand it is far superior to the unsweetened. Would like to know of some one else's experiments. We figure the extra cost at four cents per yard. Our sand here is very poor and loamy."

LOCOMOTIVE SPARK ARRESTERS.—Sparks from locomotives are rarely the cause of fires in England. In a recent suit against the Great Western Railway for the burning of hay ricks, the engine was shown not to have been equipped with a spark arrester, but the company claimed that it had used every reasonable precaution by the use of special contrivances, viz., a brick arch, a smoke deflector plate, and tubes of small diameter. Expert evidence was to the effect that spark arresters are in use on certain English railways, but are not looked upon with favor and are going out of use. The verdict was for the company. During the three years, 1888, 1889, 1890, the Great Western Railway trains ran 100,000,000 miles, and there were but six claims for damages due to sparks, only two of which claims were substantiated.

UNIVERSAL JOINTS FOR GLASS TUBES.—A glass ball and socket joint will sometimes be found very convenient for making connections in pneumatic apparatus, etc. Such a joint, as invented by Professor McLeod, can be easily made in the following manner: One end of a glass tube is thickened by heating it in a blow-pipe flame. This is to constitute the ball. For the socket a thick bulb blown in a similar piece of glass tube is cut in half. Ball and socket are then ground together by means of emery and solution of soda; and the joint is finally polished with rouge and soda solution. By

slightly greasing it, and placing a little mercury in the cup, a perfectly air-tight and flexible connection is obtained.

THE CALLA BULB AS FOOD.—It is said that the bulbs of the calla lily, which grows in such abundance all over California and the Southern States, are very edible. The tuber must first be boiled to get rid of its acrid taste. After boiling, it may be fried, roasted or hashed with cream, when it becomes very palatable and tastes much like a potato, except that it is more mucilaginous. Florida farmers are said to be planting it by the acre.

THERE are now 120 women in the Berlin telephone exchanges. It has been decided to employ only women in the future, as their voices are much more audible than men's, owing to the higher pitch.

GOOD HEALTH.

Warmth in a Sick Room.

Warmth is a most essential factor in the management of disease. A medical writer says: "A person in a very warm room, without any other treatment, will be safer with the disease than if he were in a cold room, with the best possible treatment otherwise. Again, a person seized, as patients usually are, with a chill, or with headache, or with general aching of the body—the usual initial symptoms—is liable to the greatest danger unless he immediately seeks the protection of warmth."

THE SICK ROOM TEMPERATURE.

Physicians tell us the proper temperature of a sick room should be from 65 to 70 degrees Fahr., and the heat should not go much below or much above these points. Abundance of fresh air and sunshine is the rule in all cases, except where the order of the physician prohibits the light. There is far more danger of the patient becoming enervated by close, foul air than there is from ventilation. English physicians insist that an open fire is a necessity to the proper ventilation of a sick room, and an eminent authority on this subject says: "I do not consider any room suitable for a patient to occupy during a prolonged illness where there is not an open fire burning on the hearth, in order to secure proper ventilation." A tight stove or a furnace register will not serve any such purpose. On the contrary, the stove throws out a dry heat which can only be partly counteracted by keeping boiling water on the stove. It does not solve in any way the problem of ventilation. The furnace register too often brings up a current of foul air from the cellar or kitchen, into which the cold air box opens. Unfortunately, it is quite the exception to have the cold air box open outdoors, as it should. Even where it so opens, the furnace register does not assist materially in ventilating the room. One of the best methods of removing odors is to take a shovel of burning coals, sprinkle it with coffee and pass it around the room. Where there is infectious disease a deodorizing solution should be obtained from the physician and used in the water in which the utensils of the room, the bedding, and clothing of the patient are washed.

INFLUENCE OF SURROUNDINGS IN PRODUCING INSANITY.—In the last number of the *Journal of Medical Science*, Dr. Savage discusses this question, and begins by protesting against the acceptance of what is a too widely spread notion, viz., that nearly all insanity is the outcome of direct neurotic inheritance. The influence of heredity is not denied or minimized, but the great importance of environment is insisted upon. To quote the words of the author: "We are what we are in mind and body, to a great extent, as organic results of our forefathers; but that we are no longer naked savages is some evidence that progress and development in the individual and the race may take place as the result of changing surroundings." There can be no two opinions as to the encouragement to be got from such a view. A too great insistence upon heredity as the determining cause of insanity must land us in a hopeless pessimism as regards treatment; whereas a recognition of the influence of surroundings is the first step toward the construction of a reasonable and efficacious system of therapeutics. The author also cites many examples of hallucinations and delusions which are suggested by surroundings; and while all will not be inclined to accept his dictum that disorder of function may lead to disease of tissue, there will be few who will not share his opinion as to the efficacy of restful, pleasant surroundings in the treatment of mental disorder, as compared with the virtues of "medicine out of a bottle."

Miners' Associations.

Sierra, El Dorado, Plumas and Mono counties have joined the procession and organized County Miners' Associations to aid the State Association. Other counties will follow the lead of Placer and Nevada. Shasta and San Francisco are already organized. All the mining counties of the State should have organizations and assist with moral and pecuniary support the movement which has been started.

In Sierra county they held a mass meeting (at Downieville) and organized as a branch of the California Miners' Association. The Sierra Association elected Tiley L. Ford, Pres.; A. J. Meroux, Sec'y; H. Spaulding, Treas. Fifteen Vice-Presidents were appointed and an Executive Committee of eleven.

It is worthy of note that, at the Sierra meeting, as at others, they endorsed the State Association's resolutions to the effect "that all hydraulic mining within this State he not resumed until the action of Congress in the matter of building restraining dams be known." It is very important that this request be obeyed, as much harm will be done by those who persist in mining by this method, after the State Association has pledged its word to try and stop it. Miners in the various counties should use every effort to have such mining stopped at once.

Comstock Management.

The revelations of mismanagement in the Hale & Norcross mine, brought out by the recent litigation, have drawn attention to the fact that the Savage mine, which is next to the Hale & Norcross on the north, is under the control and management of the same parties who have had their methods shown up so plainly in the Norcross suit. The rock is milled (and otherwise manipulated) at the notorious Nevada mill by means of the same annex that has been used on Hale & Norcross ore.

A mine as good as the Savage ought to be in the hands of men entirely above suspicion, so that stockholders would have a better chance for dividends than was shown to be the case in the Hale & Norcross suit. The developments in Savage warrant dividends for the stockholders, and if the ore is only milled honestly they might be paid.

It is stated that on the 900 and 950 feet levels there has been, and is now opened a vein of pay ore which is 40 feet in width and which assays from \$60 to \$400 per ton. An expert (familiar with the Comstock) says that it is the best development that has been shown there within ten years.

The value of this ore body, as shown by the returns from the very peculiarly operated Nevada mill, is from \$17.50 to \$20 per ton. The true value of the ore is thought to be from \$120 to \$160 per ton; yet the shareholders in the company are assessed to take the ore out and mill it.

It is a great pity that, if any such operation as this is going on, it cannot be stopped, as it injures legitimate mining, and also has a bad effect even on mining stock operations even if not true.

It is stated on the street that the same crowd is cleaning up the Rock Point and another mill in addition to the Nevada mill, in order to work as much ore as possible before there is a chance of change of officers at the annual elections.

The question is, What are the stockholders going to do about it? Investigation into Norcross showed a very disgraceful and dishonest condition of affairs. People were making money who had no business to, and those who ought to have received profits, got none. Perhaps some one might have an investigation into the affairs of Savage and some other companies with good effect, and prove or disprove the truth of the suspicions or rumors which prevail. There are doubtless many transactions going on which would not well bear the light of day among some of the companies, but attention has been turned in that direction, and the managers who are not doing as they should, will do well to have a care.

The Mines and the World's Fair.

The California World's Fair Commission does not seem very much disposed to do anything of moment for the mining interests, and now that Mr. McMurray is away in Washington, pay little attention to that industry. They have been sent a gentle reminder by the Executive Committee of the California Miners' Association the Executive Committee of which adopted the following resolutions the other day:

WHEREAS, The State of California has appropriated \$300,000 for the purpose of making an exhibit at the World's Fair, to be held in Chicago; and whereas, the mining counties of this State pay a large share of the said amount in taxes; and whereas the mining industry is one of the most important industries of the State; and whereas, said counties can be but little benefited by the expenditure of said money, except by an adequate mining exhibit; therefore,

Resolved, By the Executive Committee of the California Miners' Association, that a sufficient sum should be set aside from said fund for the purpose of making such exhibit.

Mr. McMurray asked for \$40,000 out of the \$300,000 for the mining industry, but it remains to see how much of this will be given. It is proposed, among other things, to send the collection of minerals now in the State Mining Bureau. This would save

much labor and expense and is the proper thing to do, as the collection already belongs to the State. But other things are also needed. The Commissioners will have to do something for the mining industry, but they must be "stirred up" before they will do it.

A Compliment.

A number of the members of the Executive Committee of the California Miners' Association met at the Association rooms on Friday of last week, and a presentation was made to Mr. Charles G. Yale, editor of the MINING AND SCIENTIFIC PRESS. Mr. J. H. Neff handed that gentleman a very handsome watch of hammered gold, with a double chain of platinum and gold, and a very beautiful platinum and gold locket with a diamond in its face. The watch contained the following inscription: "Presented to Charles G. Yale by his friends, who appreciate his aid in the Hydraulic Mining Interest, San Francisco, March 11, 1892."

The presentation speech was made by Mr. Neff, President of the California Miners' Association, and remarks were also made by Mr. C. W. Cross, N. J. Brittain, and others. Mr. Yale made an appropriate response and expressed his thanks for the handsome mark of appreciation which his friends had given him.

It is proper to state that the funds of the Association were not drawn upon for this present, but the gentlemen who were in the San Francisco delegation of the convention and those on the Executive Committee of the Association, and who had worked with Mr. Yale, individually contributed toward the testimonial.

It happened that Mr. Yale was the only San Francisco man who went up to Auburn, to the Placer County Convention, which originated the State Convention. He served on committees there and was one of those who formulated the State address. He was complimented by the miners of that county by being placed on the Executive Committee of the County Association. To him was entrusted the organization of the movement in San Francisco, and he issued the call, stated the objects, and called to order the first meeting held in this city.

He also assisted in other work connected with the movement in this city and the preparations for the State Convention. At the convention he was on the Committee on Resolutions, and chairman of the Committee on Memorial, the latter document having been written by himself and Robert T. Devlin of Sacramento—Mr. Devlin representing the interests of the farmer and Mr. Yale those of the miner. The gentleman also assisted materially in bringing about the good feeling which resulted between the two formerly contending factions.

After the convention he assisted in the organization of the California Miners' Association in many ways and was especially active in preparing reports, resolutions, memorials, etc., and in attending to such details on committees as his professional experience fitted him for. The gentlemen who have been associated with him in all this work wished to show some mark of appreciation for his valuable and disinterested services, and took this method of doing it. Mr. Yale is now secretary of the San Francisco County Miners' Association—a position without salary, by the way—and also a member of the Executive Committee of the State Association.

A. H.

MAJOR FRANK McLAUGHLIN, of Oroville, has gone East and will assist the miners' committee in matters before Congress. He goes at his own expense and will be of material aid to the miners' cause. Major McLaughlin has forwarded to his colleagues at Washington a number of large size photographs giving a splendid representation of the stupendous works undertaken and accomplished by him on the Feather river, in Butte county.

A Land of Gold.

The Veritable El Dorado in Nevada County.

GRASS VALLEY, CAL., March 14, 1892.

TO THE EDITOR:—Your correspondent has now been in this famous mining town—I won't call it a camp, it has outlived that—since Thursday evening last. To the stranger, Grass Valley and its environs has many pleasant surprises. At this time, the smooth, rolling hills are clothed with rich grasses and the meadows and fields of waving grain, now several inches high, present a beautiful picture when viewed from some elevated standpoint. It is a rare landscape indeed. The bright green of the fields, the dusky red of the rocks where exposed, and the buff and cream color of the dumps and enormous cuts of the old hydraulic mines, form a striking contrast, which is only intensified by the somber shades of the dark pine-clad hills and a sky beautifully clear and blue. Here and there one can catch a glimpse of the snow-clad main range far to the eastward.

One can hardly believe that this is the greatest gold-mining region in all of golden California. It is *El Dorado* in fact. The low rolling hills are actually ribbed with veins of gold, which have added millions to the wealth of the world. Every mountain side is perforated with shafts and tunnels, and every ravine and flat has been turned "upside down" in the search for gold, and they have yielded abundantly.

I have stood within the week by the side of the miner as he wielded his pick in a hole less than six feet deep, and I have gazed down into the black depths of the great shaft which has penetrated the famous Idaho vein for 3000 feet and more. The mines in Grass Valley go down there is no doubt about that. It was proven long ago, but really the good people of this vicinity are the most self-satisfied lot I ever saw. They do not seem to realize the great possibilities of this magnificent region, the veins of which, with a few exceptions, have only been scratched on the surface. There are a score of mines here, now abandoned and dismantled, which paid large sums of money to their owners in the so-called palmy days, when rock that did not mill \$30 to \$60 was too low grade to work. With the improved machinery of today, the magnificent water power available, and the new and cheaper methods of working, many of these mines would again become dividend payers. I refer to such mines as the Eureka, Maryland, Gold Hill, Massachusetts Hill, the famous Allison Ranch and others.

They only require money and experienced management to be operated again successfully. The old works are flooded, and many of them no doubt are in bad condition; but there still remains, I am told, thousands of tons of rock in these mines, which, under the conditions which obtain here to-day, can be made to yield a splendid profit.

There are movements on foot, however, so I hear, to revive operations on Massachusetts Hill, and there is some talk of resumption on the Allison Ranch property. Several old mines have been pumped out, new hoists built and mining resumed within recent months, and the result in every case is said to be satisfactory, and in some instances, marked success has been achieved, notably at the W. Y. O. D. and Peabody.

If this district could be picked up and moved bodily into Colorado, the people of Grass Valley would see something which would astonish them. Within two years there would be 2000 stamps dropping where there are now 200. What Grass Valley needs is new life. There is money enough here, but energy—that prime factor of the active mining town—seems lacking.

MANY NEW STRIKES.

Almost daily, new strikes are reported. Last week it was the Peabody. Rich rock was brought from the lowest part of the mine which eclipsed anything seen for many a day in Grass Valley. This had not ceased to be talked about when the California came to the front with rock running into the thousands, and to-day the Hermosa (called facetiously the Holy Moses) is in bonanza.

Of course, these things make the boys feel good, and do a great deal toward bringing about what is so much needed here—a more energetic policy in the development of new mines and in the reopening of old ones. There is probably not a more favored mining region in the world than that about Grass Valley, and mines can be made to pay here which would be unremunerative anywhere else. If the citizens of this place would try life on the desert in the southern part of this State, or delve in the hills of the "sun-kissed" torrid zone of Arizona for hidden treasures, or even face the snowslides and climb the sky-piercing ranges of Colorado, they would begin to realize what a fine thing they have of it here.

WHAT IS GOING ON.

I do not wish to convey the impression that Grass Valley has gone to sleep altogether. Not by any means. They are at work, and in a few places are accomplishing good work.

Within the year past, the W. Y. O. D. Co. has enlarged its hoisting plant and put in a 125 horse power engine and a ten-inch Cornish pump, which lifts a column of water 307 feet, vertical measurement. Below this is a six-inch pump raising water from the eighth to the seventh level, a distance of 100 feet. At the bottom of the main shaft a sinking pump is kept in constant operation. The shaft is 876 feet deep, on the incline. It has three compartments, and is timbered from top to bottom in the most substantial and workmanlike manner.

There is one thing which I wish to note about this shaft. At a depth of 122 feet the vein changes the angle of dip several degrees. To accommodate this change in inclination, the pump rod had to be deflected upward in ac-

cordance with this change in dip. The old-fashioned travelers and wheels were dispensed with, and a stiff joint has been substituted. It was somewhat of an experiment, but it works perfectly and has reduced the friction from 40 to 20 per cent, theoretically, if not actually. The change in direction of the motion is compensated for by the use of long wedge-shaped pieces of wood which are firmly secured to the under side of the rod, which rides on trolleys or rollers ten inches in diameter. At the junction of the two angles, the rod is solidly spliced and is held in place by a trolley above. The result of this arrangement is that the rod moves in a true line with a minimum of friction and there is no lost motion. The plunger moves the same distance as the stroke at the surface—six feet.

A direct acting hoist is in use, which was made by the Risdon Iron Works. It is run by a 25-horse power engine. It works smoothly and has a capacity of 2000 feet. The hoist is supplied with two reversible drums four feet in

battery, the millman, Mr. Richards, has divided it into four parts, any one of which may be removed at pleasure. It also affords the advantage of placing any section in four different positions in the mortar, in place of changing only top for bottom. A screen can by this means be made to wear more evenly, and consequently lasts longer. A 40-mesh brass wire screen is in use here. The surface plant of the W. Y. O. D. mine is a very complete one and will answer for a long time to come. The arrangement reflects great credit on the superintendent, C. A. Brockington, and his able assistants.

This is one of the mines upon which I look as a model. If its name were "The Criterion," it would fit it exactly. Abandoned and dismantled, the present owners took the property, put on light machinery and went to work. At first the result of their labors was discouraging. They had to light water and then run into hard ground, and to make matters worse, the vein pinched, but they determined to make or

arrangements at the bottom of the iron breaker plane, the commencement of which is shown at the top of the stone wall to the right.

The hoisting rope is attached permanently to the "barney," or small car (A_2) that pushes up the larger one. The barney-track (18) runs continuously and unbroken from the left-hand corner of the barney-pit A to the dump on top of the plane, while the mine car track (16) runs from the end of the loaded car siding up the plane when the bridge A_1 is open, but when the bridge is closed, the track, which runs to an edge at the right hand end, lies over the rail (16) and makes the main car track on the plane continuous on the bridge A_1 to the empty car track.

When the empty car A descends from the dump, it finds the bridge closed until it

the real pitch of the plane, the barney and car are in the position shown on the right hand side of the drawing. It will be observed that the large wheels of the barney, while in the pit, have a rail (27) above as well as below them. This is to prevent the wheels from rising and the barney from getting off the track. From here on the car and barney continue on to the dump. The system of levers (30 and 34) is a self-acting arrangement to drop in a car at a time.

The details of numbered parts of the barney-pit and bridge, shown in the cut, are as follows: 2, trunnion-stanchion; 3, trunnion-pedestal, right hand; 4, trunnion-pedestal, left hand; 5, vertical timber to receive trunnion-pedestal (4); 6, horizontal timber carrying trunnion-pedestal (3); 7, bridge rails; 8, upper rocker-har, automati-

"BARNEY" PIT AND BRIDGE FOR HANDLING AND DUMPING MINE CARS.

diameter, having an 18-inch face. The cables are 2-inch steel wire.

Another novel device is in use at these works in the shape of a heater for the water used in the boilers. It consists simply in discharging the exhaust steam through a six-inch pipe which extends outside the building, where it projects for about 12 feet into a 10-inch pipe, the ends of which are securely fastened to the exhaust pipe, the end of the exhaust pipe being entirely open, however. Between these two pipes the water circulates and reaches almost a boiling heat before being conducted to the boilers. It is a simple and very effective heating arrangement. The hoisting works are supplied with a drying-room, blacksmith shop and all other necessary adjuncts.

The mill has ten stamps with plates inside and out. The very low angle of dip of the latter attracted my attention, but it seems to give satisfaction.

Two true vanning machines are in use and appear to do the concentrating of the iron sulphides perfectly. The quartz contains four or five per cent of concentrates which will average about \$100 per ton. The only really notable thing about the mill of this young company is the fashion of setting their screens. In place of using the usual screen extending across the

break something. Their perseverance and good grit was rewarded. A number of the men, including Mr. Brockington and his foreman, Mr. Connors, the mill foreman, Mr. Richards, and the master mechanic, Mr. Oliver, took part of their pay in stock at a nominal figure. Today the mine is said to be payin', with ore reserves in sight and a splendid vein on the lower levels. The W. Y. O. D. has set an example which the men of Grass Valley will do well to emulate.

In my next I will have something to say about other mines and other miners of this district.

W. H. STORMS.

Handling Mine Cars.

In last week's PRESS, a description was given of the "barney" and pusher for dumping mine cars used at the Cross creek collieries. As stated, part of the coal prepared at the "breaker" (where the coal is sized and sorted) is brought from a mine half a mile away. The loaded mine cars are brought to the foot of the breaker plane hoisted and dumped. The accompanying cut shows the barney-pit and bridge, and

comes to the end of the siding and is stopped, or until it reaches the empty cars already on the siding. The barney being narrower, passes between the sides of the swinging bridge between the rails of the loaded track (16) down the barney-track (18) to the back of the barney-pit.

The bridge A_1 consists of two trusses, each truss having a bearing at either end (3 and 4) so that by swinging around them, the bridge is opened or closed. When the barney descends, it finds the bridge closed; and when it reaches the bar (20), its axle pushes forward by means of (20) the levers (19 and 21) and thus opens the bridge for the full car to go up. When the barney is in the position shown on the right hand side of the figure, it pushes forward the levers (9 and 10) and closes the bridge so that it will be ready for the empty car when it descends.

As the wheels are obliged to follow the track (17), the pusher comes in contact with the car and forces it forward and then up the plane, so that when the car gets on

cally shifted by barney-axle throwing levers (9) and (10), the latter pulling (14) and closing bridge A_1 ; 9, upper idle rocker-lever; 10, upper acting rocker-lever; 11, brace-end supporting counterweight 13; 12, counterweight lever; 13, counterweight to balance bridge-shifting mechanism; 14, upper shifting rod to close bridge A_1 ; 16, mine car rail; 17, rail for elevating pusher on upward motion; 18, rail in pit for barney-truck wheels; 19, lower idle rocker-lever; 20, lower rocker-har for opening bridge, operated by axle of barney-truck on downward motion; 21, lower acting rocker-lever; 22, bearing for (21); 23, bolts for (22); 25, bearing for (19); 26, bolts for (25); 27, overhead guard-rail for barney-truck wheels; 28, bearing for pusher-latch (29); 29, pusher-latch raised on downward motion of barney; 30, releasing-lever; 31, bearing for trip-lever (33); 32, pin for trip-lever; 33, trip-lever for raising stop-har; 34, trip-rod to raise lever; 49, lower shifting-rod to open bridge; 50, bridge-shifter; 51, fixed bar with pin on which shifter 50 turns.

Valuable Books on Minerals, Mining AND ASSAYING.

The Prospector's Field Book and Guide in the Search for and easy determination of Ores and other Useful Minerals. By Prof. H. S. Osborn, LL.D., author of "A Practical Manual of Minerals, Mines, and Mining," illustrated by 44 engravings. 12mo, 176 pages. Price.....\$1.50

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the Useful Minerals; full descriptions of the most effective methods of both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL.D. illustrated by 171 engravings. 8vo, 387 pages. Price.....\$4.50

A descriptive circular, giving the full tables of contents of the two books above named, sent free to any one who will send his address.

A Treatise on Metalliferous Minerals and Mining. By D. C. Davies. With 148 illustrations. 12 mo, 432 pages. Price.....\$5.00

Mine Drainage. By Stephen Mitchell. 8vo, 277 engravings. Price.....\$6.00

A Treatise on Earthy and Other Minerals and Mining. By D. C. Davies. With 76 engravings. 12mo. Price.....\$5.00

Mineralogy Simplified. Easy Methods of Identifying Minerals, including Ores, by means of the Blow-pipe, by Flame Reactions, by the Spectroscope, and by Humid Chemical Analysis, based on Von Kobell's Tables for the Determination of Minerals, etc. By Henri Ernst, M. D. Illustrated. 12mo. Price.....\$3.00

Underground Treasures: How and Where to Find Them. A Key for the Ready Determination of Minerals Within the United States. By James Orton. Price.....\$1.50

The Assayer's Manual. An Abridged Treatise on the Docimastic Examination of Ores and Furnaces and other Artificial Products. By Bruno Keri, Professor in the Royal School of Mines; Member of the Royal Technical Commission for the Industries, and of the Imperial Patent Office, Berlin. Translated from the German by William T. Brant, Editor of the "Techno-Chemical Review," etc. Second American Edition, edited with extensive additions by F. Lynwood Garrison, member of the American Institute of Mining Engineers, Iron and Steel Institute, Verein Deutscher Eisenhüttenleute, etc. Illustrated by 87 engravings. 354 pages, 8vo, cloth. Price.....\$3.00

A circular of 8 pages, quarto, giving the full Table of Contents of this important Book, as well as a new List of Leading Books on Metal-Mining, Metallurgy, Mineralogy, Assaying, Chemical Analysis, etc., sent free to any one in any part of the world who will send his address.

For the above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.

Our New and Revised Catalogue of Practical and Scientific Books, 88 pages, 8vo, and our other catalogues, the whole covering every branch of Science applied to the Arts, sent free, and free of postage, to any one in any part of the world who will furnish his address.

WATER WHEELS

BUILT BY THE **JAMES LEFFEL & CO.** WITH 30 YEARS EXPERIENCE.

FOR MINING, ELECTRIC and IRRIGATING PLANTS.

Easy working gates, highest percentage of power and regular speed at all gateage. Equally adapted to high and low heads. 110 sizes and styles. Write us, give number of feet head and size of stream, state what kind of mill you have, and we will send fine pamphlet.

THE **JAMES LEFFEL & CO.**, SPRINGFIELD, OHIO, AND NEW YORK CITY. GEN'L AGENCIES: FRASER & CHALMERS, CHICAGO, ILLS., AND PARKE & LACY, SAN FRANCISCO, CAL.

BALDWIN LOCOMOTIVE WORKS. LOCOMOTIVE ENGINES!

ANNUAL CAPACITY 1000. ESTABLISHED 1831.

Adapted to every variety of service, and built accurately to standard gauge and templates. Like parts of different engines of same class perfectly interchangeable. Broad and Narrow Gauge Locomotives, Mine Locomotives by Steam or Compressed Air, Plantation Locomotives, Noiseless Motors for Street Railways, Furnace Locomotives, etc.

COMPOUND LOCOMOTIVES

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 17, 1892.

General rains the past week, with cooler temperatures since, have tended to little in promoting a much healthier tone to general trade, and were it not for the exorbitant charges made by the railroad on local freights, that is, on goods shipped out of this city, general trade would be better than ever before, while the volume of goods which would be sent out would show a most remarkable increase. It is confidently expected that we will soon enjoy the benefits to be derived from a competing railroad. When this does take place, then the trade of this city will be more than double. Iron workers report business active with orders ahead. Raw materials continue in their favor. Money is easy, with the rate of interest in borrowers' favor. The following statistics are an interesting study, for they give the gross and net earnings of the savings banks in this State in comparison for five years past:

	Gross.	Net.
1887	\$4,134,444	\$3,112,955
1888	4,969,899	3,677,277
1889	5,907,583	4,377,935
1890	6,917,331	5,131,808
1891	8,059,058	5,956,601

As will be noticed, the gross earnings last year were nearly double the amount reported for 1887, but it must be remembered that in the meantime the number of banks has nearly doubled. Calling the difference between the net and gross earnings the expense account, we find the cost of maintaining these banks from year to year has been as follows:

In 1887	\$1,021,489
In 1888	1,292,622
In 1889	1,529,048
In 1890	1,755,523
In 1891	2,100,457

Eastern mail advices report easy money markets in the various financial centers, with no marked call for funds from any particular source. A singular state of affairs exists in New York, in this, that gold is cheaper there than anywhere else in the world. By this it is meant that gold can be taken from the treasury without charge, and that the rate of exchange is such that every nation in the world is offering an inducement to take gold from this country. England is the last to buy, and France sells only when there is a profit in it. The Imperial Bank of Germany is offering inducements for shipments to Berlin. We do not send gold bars, but it may be said that to-day American double eagles, taken into consideration freight, insurance and exchange, are worth more in proportion to their weight in gold than any other gold coin in existence.

QUICKSILVER—Receipts the past week aggregate 366 bushels. The market is steady at around quotations.

MEXICAN DOLLARS—Exports by sea the past week aggregate as follows: to Hong Kong 125,920 dollars. The market is easy at around 71 1/4 cts.

SILVER—On Tuesday next the Bland free coinage bill will come up for debate in the House of Representatives. From all we can learn the bill will be rushed through and go to the Senate on or about Monday, March 29. It is claimed that the Senate will also rush the bill through so as to get down to other work. There is a diversity of opinion as to what action President Harrison will take but the prevailing belief is that he will veto it, in which case silver will be an important factor in the incoming presidential election. We can not reasonably look for any material change in the silver market until after Congress acts on the free coinage bill. In Europe, attention is centered on this country and therefore the action of Congress on the Bland bill will carry large weight in shaping the course of European countries on bimetalism. The supply of silver in this country is running low, at any rate, the Mint is no longer buying the 4,600,000 ounces a month as required by law. The last steamship for China took out \$31,500 worth of silver to Higo.

BORAX—The market is essentially unchanged both here and at the East.

LIME—Receipts the past week were quite light, aggregating only 1505 bbls. against over 7000 bbls. the week before. The market is reported steady at current quotations.

ANTIMONY—The market is easy. Eastern advices report that last week's quotations can be shaded.

PIG IRON—Imports the past week aggregate as follows: Dundee, 700 tons; Tyne, 200; Hull, 50; total, 950 tons. The market is quoted lower. Even at the decline, any selling pressure is being met by still lower bids on the part of consumers. The low prices ruling at the East, combined with good crop prospects in this State, are against any possible advance in the market this year. Our latest mail advices report that six of the largest iron companies at the South are organizing to act in concert, and that if they succeed in effecting satisfactory arrangements, the new organization will be able to reduce the price of iron obtained. They have an abundant supply of very cheap coal and very cheap coke and plenty of ore with which to do it. The coke only costs about one-half what it did three years ago.

TIN—The market continues to be unsettled and largely in buyer's favor, owing to consumers having their near by requirements met. The stock here is said to be more than enough to meet the demand, but this, so far as plate is concerned, will largely depend on fruit crop prospects at the East.

COPPER—It now looks as if the talk of combine has been so far organized as to warrant the assertion that it is a possibility for future action. It is based on business and not on a speculative basis, and, being such, it will prove advantageous to consumers and producers alike. James Lewis & Sons' circular, under date at London, March 24, reports as follows: After considerable delay in settling the details, about 7000 tons of argenteiferous copper matte have been found for delivery up to the end of the year, at a price based on the price for best selected and good merchantable copper at the time of delivery. Negotiations for the restriction of production in the United States have been resumed, and promise to be successful.

COKE—Imports the past week aggregate 302 tons from Hull and 1233 tons from South Shields; total, 1535 tons. The market is barely steady, notwithstanding free competition.

COAL—Imports the past week aggregate as follows: Swansea, 2207 tons; Coos Bay, 100; Nansim, 335; Departure Bay, 1040; Liverpool, 3981; Tyne, 2696; New York, 200; Philadelphia, 150; Hull, 853; Sydney, 1837; South Shields, 650; Glasgow, 418; Seattle, 3365; total, 25,354 tons. The market is weak, with buyers securing concessions on quotations for spot parcels. The stock here is largely in excess of the demand, while limited export crop weather is a guarantee that the supply for shipment will be heavy. This will be available for fall and winter use.

THE Mineral Farm mine at Ouray, Colo., closed down on Wednesday and discharged all its men, giving as a reason the low price of silver. Its ore is a low grade, but there is no end to it.

Mining Share Market.

SAN FRANCISCO, March 17, 1892.

The mining share market showed more activity in the North End shares under the leadership of Con. Virginia. The Middles barely held their own while the Gold Hillers shaded off under an assessment scare, and the pool crossing orders on the down grade. The market continues in a feverish and unsettled condition, with no attractions as yet for outside money to venture in. Everything still warrants the assertion that there has been no change of heart with the stock pools and mill rings, and until they are forced to concede that outsiders have some rights to the bullion produced, the game will continue to be royal feasts for insiders and woad puddings and financial choices for outsiders. All indications, at this writing, point to the stock pools manipulating for higher prices, probably to unload certain stocks on gudgeons. This will of course be done on wind if it is possible, but if the worst comes to the worst, then ore will be shown up in an unexpected quarter, when the usual results will follow—higher ranges of prices, with outsiders as buyers on the advance and a general declining market with assessments for outsiders, and mine looking for insiders for many months to come. There is another cogent reason why inside pools and rings may find themselves compelled to make the market more attractive, viz: the right waged by the Mining Stock Association to create a reform in the management of the mines, and the fight waged by the Board of Directors of the interest of outside shareholders to make the inside rings buy stock with which to control the mines, have created more opposition than counted on in securing mines for looting. When the market is active outsiders pay very little attention to mine looting and assessments, and therefore insiders movements go unnoticed, or, at least, that has been the case heretofore.

In outside mining shares, trading continues light, although toward the close the Razor Blades were more active under cross orders on Del Monte and Nevada Queen. Several mines in the district (Pascorora) have been saving ore for months past, probably to make a good bullion showing so as to sell the mining shares at quite an advance. No outsider, so far as the writer knows, has come up ahead on an investment in the Razor Blades, but several suicides have followed such investment.

The election of A. K. P. Harmon president of the Potosi Mining Co. and also president of the Chollar Mining Co. is accepted by outsiders as indicating that the mill rings have something in store, but its nature they must either guess or else wait developments. Mr. Harmon was vice-president of the Hale and Norcross Mining Co.

At the Chollar election, Mr. Tingman, Secretary of the Mining Stock Association, read a protest against the way in which the mine has been managed, and demanding that certain reforms be instituted by which the mining and milling of ore will conform to the laws under which the company incorporated. This protest was read, and if not lived up to by the management, the officers will get into serious trouble. Times are somewhat changed and mine directors will soon learn it to their cost.

News from the outside mines are of a more encouraging character. In the Quiltoia district, very important work is being done in several mines. The Silver King Mining Co.'s mill is being moved to the mine which will save a heavy expense. Ore is being assayed for millage. In the Bodie district, Mono has cut a foot of rich ore, which is to be well prospected. Bodie had 100 tons of ore milled, which assayed, in the pulp, over \$38 a ton. The mill is now running on Summit ore. The Standard Co. reports several improvements. The Superintendent of this mine (Standard) does not give either car-sample or battery assays, but the results of this failure of the reports are first-class and a decided improvement on the reports from any mine in either that or the Comstock district.

From the Comstock mines, our advices continue of a most favorable character, confirming everything heretofore published by the Press. Official letters begin to hint in the proper direction, and possibly the Superintendent of the mine will begin to develop work is being done may tell a little more than they are now allowed to do by the mill rings; yet what is the use of ore while the rings get the bullion and outsiders get left with assessments to pay. Confirmed advices are received regarding the development in Savage on the 950 and 900-foot levels. Why don't the Directors of this mine insist on Supt. King and his Levy resigning? It is said that if this is done, the mine will be differently worked. It looks as if work in Con. Virginia is being done to make the stock more attractive. The last deal was made on assays, now it may be done on work in a mine. The Potosi, and also the Overman managements, played the winzack racket to perfection. Work in the Middle mines is being closely watched. More miners, and more capital, are put to work in the Potosi. The Gold Hill mines never promised better results than they do now, but the rings are still in the ascendancy, which creates distrust in the minds of operators.

Authentic reports are current that the Hale and Norcross management is negotiating for a lease of the Occidental mill, and that the Savage Co. will get the Rock Point mill to reduce ore. Rumors are current of several other changes contemplated to be made in the near future. If the output of ore in the Bodie district continues to increase, more milling capacity will be required very soon.

RISDON IRON WORKS,

S. E. Corner Howard & Beale Sts., S. F.

MANUFACTURERS OF THE

CELEBRATED

Bryan Roller Mill.

This Mill is a Modification of the well-known "Chile Mill," arranged for the Continuous Crushing of Gold and Silver Ores.

It is **POSITIVELY** the best Gold Amalgamator in the market.
It saves from Five to Twenty-five per cent more gold than other mills.
Its immediate and free discharge prevents the possibility of sliming.
It requires a minimum of power and crushes hard as well as soft ore.
Its comparatively slow speed insures freedom from excessive wear.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have
our new Improved Concentrating Belt manu-
factured in San Francisco. We keep always
on hand Belts suitable for the Triumph and
Frue machines, but can make any length or
width desired. The advantages of these belts over
any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute
angle inclining toward the center, and therefore readily
conform to the change of direction while passing over
the end rollers; thus the vexation and loss caused by the
frequent breaking of the flanges of the old style belt is
practically done away with. Again, our belts, at intervals
of two to four feet, have a very slight rifled surface for the
space of three inches, which tends to equalize the pulp
on the belt, and prevents it from banking on the sides and
forming channels through the center. These slight rifflings
also save very fine sulphurets and the quicksilver that
would otherwise escape with the tailings from a belt,
the surface of which is entirely smooth. We can safely
say that it is a better belt than has ever been manu-
factured for use on this coast. It will last much longer
and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

PLACER AMALGAMATORS

Combined with Steam Shovel or Dredge.

BUCYRUS SYSTEM.

NEW METHOD OF PLACER MINING.

Saves all the Gold. Uses very little Water. Treats large quantities at Low Cost.

COMMON SENSE PULVERIZER AND CONCENTRATOR.

This is the Most Successful Machine yet discovered for working gravel, cement, clay, etc. It avoids crushing the rocks, which are washed clean, while at the same time it pulverizes the CEMENT or CLAY, and

SAVES THE GOLD ALTHOUGH IT IS AS FINE AS FLOUR.

It is only necessary to have from four to six inches of water to work 100 tons or more every 24 hours.

The machinery consists of two iron troughs or "concaves," each 20 inches in diameter, one of which is about 18 and the other 12 feet long.

In these troughs are strong revolving shafts with projecting teeth, made of steel, two inches wide by three-quarters of an inch thick, placed in spiral form around the shaft, about two inches apart, forming a conveyor.

The first shaft is arranged to revolve from 150 to 250 revolutions per minute, and the second one from 300 to 500.

There is a revolving screen between the two troughs that takes out the coarser rocks after being washed, and only the finer material runs into the second trough, and is there worked thoroughly.

There is a space of about four inches in the bottom of each trough, or "concave," that fills up with gravel and sand. When the gold is freed it settles into this, and as the teeth do not disturb the bottom, the gold remains there until a cleanup is made.

VALLEY SPRINGS, CALAVERAS CO., CAL., July 19, 1890.
Mr. S. K. SNODGRASS—Dear Sir: We find your machine perfectly reliable for four to five tons per hour, according to size of gravel. The work is well done, and not to exceed five per cent gets by, which I believe is very close work for any machine.
Yours,
L. A. SHEAD.

DURSON, CALAVERAS CO., CAL., July 3, 1890.
S. K. SNODGRASS—Dear Sir: I have seen the Common Sense Pulverizer and Concentrator in operation, and will say that for all kinds of gravel and clay it is the best machine I have ever seen.
Yours respectfully,
A. J. KNAPP.

PLACERVILLE, CAL., July 15, 1890.
S. K. SNODGRASS—Dear Sir: I have worked with your machine in two counties, and have never seen the equal of it for washing gravel or saving fine gold. I have helped to clean up and found fine flour gold. I have put through it at the rate of 100 tons and over per day, and have also prospected the tailings thoroughly and found no gold in them. I have talked with other parties who have worked with them and say they are a good machine. Have been mining over 25 years.
Very respectfully,
D. G. HUGHES.

VALLEY SPRINGS, CAL., June 30, 1890.
S. K. SNODGRASS—Dear Sir: I have seen the working of the Common Sense Pulverizer and Concentrator in clay and all kinds of cement, and have examined the tailings, and will state that I have never seen work done by any machine that compares with it. I have seen it when working from 100 to 150 tons per day, and been present when cleanings were made, and seen gold as fine as flour. I would recommend it for using in any kind of placer mining. I have been mining for 20 years.
Yours,
J. D. COOK.

SAN FRANCISCO, March 25, 1891.
S. K. SNODGRASS, Esq.—Dear Sir: In regard to the work done by your machine, which we have had in operation for the past three months, I can say that it has handled successfully all material as taken out of our ground, the only cement which was not perfectly broken up being an exceedingly hard cemented material approaching rock in its hardness.

For all free wash and moderately hard cement it will do very good work, and must effect a great saving in working such gravels and cements, owing to the small head of water required; and furthermore, its great gold-saving qualities, as I am satisfied that fully 95 to 98 per cent of the gold freed in the machine is saved, even to flour gold, and that too without the use of quicksilver.

The automatic rejection of all rocks and material by the revolving screen makes the handling of the gravel cheaper, as all hand culling of the material is rendered unnecessary.
Yours truly,
W. W. B. STEVENS.

CHICO GULCH, CALAVERAS CO., CAL., July 10, 1891.
Mr. SNODGRASS—Dear Sir: I was down to Spring Valley looking at the machine and it runs very nice and a great deal better than I expected. If you can make them work as well as that one it is the finest machine in the country, and I examined it thoroughly. I have been around gravel mines for the last 30 years. Yours respectfully,
STEPHEN M. HUGHES.

S. K. SNODGRASS,
ROOM 13,
220 SUTTER ST., SAN FRANCISCO.

F. A. HUNTINGTON. PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

SAN JACINTO ESTATE, LIMITED,
 Office of General Manager,
 P. O. Address, South Riverside, San Bernardino Co., Cal.
 CAJALCO, Dec 15, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager.

VOL. LXIV.—Number 13.
DEWEY PUBLISHING CO.

SAN FRANCISCO, SATURDAY, MARCH 26, 1892.

Three Dollars per Annum.
SINGLE COPIES, 10 CENTS.

A New Cooking Utensil.

George W. Merk of 560 Howard street, this city, has obtained through the Mining and Scientific Press Patent Agency a patent on a novel cooking utensil which is applicable for various purposes. The lower vessel of the utensil has a central open tube, provided at its upper end with a removable cover. Upon one side of this lower vessel is a spout from which the water may be poured. This spout is a little lower than the

Splicing Wire Ropes.

As it is often necessary to effect a splice in wire ropes in and around mines, it will be well to reproduce the excellent directions given by Roebbling, a well-known American maker. The tools needed are: Pair of nippers for cutting off ends of strands; pair of pliers for pulling through and straightening ends of strands; point to open strands; knife to cut core; wooden mallet, and two rope nippers with sticks to untwist the rope. In

passing each other at points four feet apart, as in *D*, 4, to secure and dispose of the ends without increasing the diameter of the rope, nipper two rope slings around the wire rope, say six inches on each side of the crossing point of two strands; insert a stick through the loop, and twist them in opposite directions, thus opening the lay of the rope *E*; next cut the core six inches on the left, and stick the end of 1 under *a* into the place occupied by the core; then cut the core in the same way on the right, and stick the end of

hesive coke. To this end many means have been proposed and tried. The attempt has been made, without practical success, to press the coal together in the coke oven. Again, the coal has been made into bricks, which, by reason of their regular shape, could be packed tightly together in the oven; but this practice also has failed of general adoption. Finally, resort has been had to the method of sampling the coal in a box, and charging into the oven the whole of the thick slab thus produced. This pro-

MERK'S COOKING UTENSIL.

METHOD OF SPLICING WIRE MINING ROPES.

APPARATUS FOR CHARGING FINE, STAMPED COAL INTO COKE-OVENS.

top and prevents the vessel being filled so full that it will overflow into the central tube. The utensil may be used either upon the top of a stove or range, or a cover of the range may be removed so that the heat will pass directly up the tube. When it is desired to use the device as a steamer, the upper chamber or vessel is employed, and this is fitted into the top of the lower vessel when the cover has been removed. When in place, the extension covers the entrance to the spout to prevent escape of steam. This upper vessel has also a central tube, open at bottom and top, and connecting with the lower tube.

Heat may thus be admitted to the bottom of the steam cooker or steam may be admitted from below as desired. The arrangement is such that food is prevented from getting "soggy," as is apt to be the case in steam cookers. The main lower vessel can be used alone as a teakettle when required. The utensil is adapted for gas or oil stoves, as well as for ordinary ranges.

operating, 1, heave the two ends taut, with block and fall, till they overlap each other about 20 feet; open the strands of both ends for 10 feet; cut both hemp cores as closely as possible, and bring the open bunches of strands face to face, so that the opposite strands interlock regularly. 2, unlay any strand *a* (see cuts) and follow up with strand 1 of the other end, laying it tightly into the open groove left upon unwinding *a*, and make the twist of the strand agree exactly with the lay of the open groove, until all but about six inches of 1 are laid in, and *a* has become 20 feet long; cut off *a* within six inches of the rope *B*, leaving two short ends, which must be temporarily tied. 3, unlay a strand 4 of the opposite end, and follow up with the strand *f*, laying it in the open groove as before, and treating it precisely as the first *C*; pursue the same course with *b* and 2, stopping however within four feet of the first set; then with *c* and 5, *c* and 3, and *d* and 4; thus all the strands are laid in each other's places, with the respective ends

a in the place of the core, the ends of the strands being straightened before they are stuck in; loosen the rope nippers, and let the wire rope close; a wooden mallet will beat out any slight inequalities remaining. Repeat the operations in the other five places.

Preparing Coking Coal.

The difficulty with German coking coals is usually to be found not so much in an excess of ash as in the lack of "coking quality," even when the ash is low. So far as the ash is concerned, an adequate remedy has been found in careful crushing after sizing. There is claimed to be a decided advantage in crushing coal before coking in the more intimate contact of particles thus secured. Experience has shown that the smaller the quantity of heavy hydrocarbons in the coal (these being the well-known determinants of its coking quality) the closer must the solid particles be brought together in order to form a co-

cedure has given satisfaction in German works, and is now in somewhat extensive use. The apparatus shown in Figs. 1, 2 and 3, from the German Imperial patent of J. Quaglio, No. 36,097, is used especially by Upper Silesian coke-makers, who everywhere stamp by hand. The cuts are self-explanatory. We have not many coking coals on this coast; what there are come from the Puget Sound section. Possibly, with an apparatus of this sort, coke might be made from other coals lacking the proper "coking quality."

WHEN the news reached Bodie that Joe Ryan had been appointed superintendent of the Hale & Norcross, it seemed to the people as much satisfaction as if a free coinage bill had been passed by Congress. Mr. Ryan was for a short time superintendent of the Bodie tunnel and made a very favorable impression on our people, and they all now rejoice at his good fortune.—Bodie Miner,

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

Gaylussite.

On a New Variety from San Bernardino County.

SAN FRANCISCO, March 19, 1892.

TO THE EDITOR:—The alkaline lakes, sales and the mineral springs of California and Nevada have long been objects of interest, not only to the people of the Pacific Coast, but to the world generally, from an economic standpoint because of the large output of borax and borax minerals, and from a scientific one for the interesting features they present to the geologist, the chemist and the general scientific observer.

These are great chemical laboratories in which nature is now employed in transforming one class of minerals into others. In sedimentary rocks deposited so long ago that the period cannot be stated, containing minerals in which all affinities were satisfied, a slow setting free of imprisoned elements has at last produced a condition of heterogeneity, with new affinities, resulting in the production of new compounds and chemical energy manifested by heat, which in other lands, on a larger scale and more highly intensified, has culminated in volcanic eruptions.

The same phenomena in miniature have been recently observed in my laboratory. I have a tank filled with water in which I make frequent washings of pulverized ores and minerals to obtain concentrations for examination. I have often noticed on the surface of the water, bubbles of escaping gases resulting from the heterogeneous minerals which have settled on the bottom, seeking new affinities and mutually decomposing each other.

On one occasion, I allowed the water to flow out very gently without disturbing the deposit, which I found to have changed from the heavy sediments one would expect to find, and assumed the form of a light porous matter showing signs of fermentation.

To elucidate more fully what I have stated, I call special attention to the mud volcanoes on the sedimentary plains of the Colorado desert, San Diego county; the so-called geysers of Sonoma county; the thermal alkaline mineral springs, gas emanations, sulphur lakes and mercury sublimates of Colusa county; the great gas fountain in Clear Lake, Borax Lake and the hot ammoniacal spring in Lake county; the natural gas flowing from deep wells in San Joaquin county, and similar phenomena at sundry other localities.

I send you this communication to lay before your readers the result of an investigation and study of amorphous gaylussite—a rare variety brought to me from the borax fields of the San Bernardino Borax Mining Co. by Mr. J. W. Searles, which has a special bearing on this very interesting subject.

I found it to be a confused semicrystalline mass, but there are no distinct or defined crystals—none that resemble the semiopaque ones found so profusely in the numerous alkaline lakes of California and Nevada.

Under the microscope, some woody fragments were garnished by clusters of attached crystals, just as gaylussite forms in alkaline lakes on floating twigs. This peculiarity was very marked. Occasionally, an imbedded crystal shows a few facets imperfectly defined.

The mineral has the following physical properties: It is only partly soluble in water, but is almost wholly so with brisk effervescence in acids. It is soft (hardness 2); the hardness of the crystals generally found is sometimes 3; easily crushed; hygroscopic; the acid solution neutralized with ammonia gives a heavy precipitate with oxalate of ammonia.

It shows evidences of having been deposited in strata by successive stages. At first I thought it might be a mechanical mixture of lime and soda carbonates, but the microscope shows that it is not. In platinum forceps it is very fusible, colors the flame intensely yellow, evolves the lime light; in closed tube gives much water; at full red heat in a platinum dish it first parts with its water and then fuses perfectly with effervescence; on increasing the heat, it separates into two parts—one, A, is very fluid and the other, B, is solid.

Portion A is wholly soluble in water, does not effervesce with acids, nor react for lime, is strongly alkaline; the evaporated solution leaves a white fusible residue.

Portion B nearly all dissolves in hydrochloric acid, without effervescence, and gives the lime reactions.

I have not been able to find any published notice of gaylussite other than crys-

tallized, nor have I before seen a specimen of the amorphous mineral.

Gaylussite in crystals was first discovered by Boussingault in a soda lake at Lagunilla, near Merida, Columbia, in a bed of clay. It contains one equivalent of carbonate of soda, one of carbonate of lime, and six of water. The original analysis by Boussingault was:

Carbonate of soda.....	34.5
Carbonate of lime.....	33.6
Water.....	30.4
Clay.....	1.5
	100.0

Thinolite is an impure carbonate of lime, found on the margin of alkaline lakes in California and Nevada. It was so called by Clarence King, United States Geologist, in 1876, from a Greek word meaning a shore, a name suggested by the common locality. It was published in the first volume of the United States geological exploration of the 40th parallel, folio 508. In the same volume (folio 517) he advances the opinion that it is a pseudomorph of calcite after gaylussite, and he refers to the mineral as being crystallized. He says (folio 518) it is gaylussite; "thinolite is therefore practically, leaving out impurity, a pseudomorph of carbonate of lime after gaylussite"—"pseudo gaylussite;" here some peculiar specimens are beautifully figured. He theorizes as to the formation of thinolite, and thinks lime is added to a saturated solution of sesquicarbonate of soda.

It is my opinion that two constituents of gaylussite are formed at the same time, and perhaps, by a single operation. I am led to this opinion by the signs of stratification in the specimens I have examined; I think further that thinolite is the result of subsequent leaching out of the carbonate of soda, which becomes soluble gradually and naturally—an operation I so quickly performed in the platinum dish; I believe also that the lime and soda which combine with the carbonic acid and water to form gaylussite, are both derived from the abundant eruptive rocks in all of which they are material constituents. Analysis shows that basalt contains from 8 to 10.56 per cent of lime; diorite 4 per cent; andesite from 4 to 9 per cent, and granite 0.69 to 3.06 per cent.

When I began to consider this, my mind reverted to what I had observed at two very interesting localities; one, the mud volcanoes on the Colorado desert—described in the second report of the State Mineralogist, 1880, fol. 227, where "inverted stalactites" of carbonate of lime were forming, and the other, the flanks of Sentinel Hill, near Tucson, Arizona, where the so-called plutonic rocks were seeping water that deposited a calcareous tufa which was spread over the loose detritus of the talus for miles and miles.

The cause of limestones alternating, or being in juxtaposition with the eruptive rocks, has been a perplexing problem with geologists, and none seem to have surmised that the lime resulted from the metamorphism of the eruptive rocks themselves. The formation of limestone tufas near Sentinel Hill is now in active operation, as it is at the mud volcanoes mentioned.

I have been familiar with thinolite since 1862, 16 years before it was described by Clarence King, and have studied it in its varied forms at many localities in California and Nevada; it is burned for lime where none other can be procured.

When I first saw it on the shores of Mono and Owen's lakes, and in the ancient beds of others long since vanished—their departure having been caused by climatic alteration, change of levels, or by the accidental removal of natural barriers—I believed it to be fossil coral.

I conceived the idea that thinolite was a pseudomorph long before I read Mr. King's description, but I could not reconcile the difficulty of massive thinolite being formed from small individual crystals, the only form of gaylussite I was familiar with. This variety seems to be the missing link which may exist in large quantity, and may have been overlooked. It much resembles amorphous thinolite. If the soda were wholly leached out the remaining mineral would be porous, just as thinolite is sometimes known to be, and if distorted by pressure or other cause, it might assume some of the fantastic forms peculiar to that mineral.

HENRY G. HANKS.

ANTI FRICTION BEARINGS.—The metal of the well-known patent Magnolia anti-friction bearings has been found by analysis to have the following composition: Lead, 80 pounds; antimony, 15 pounds; tin, 5 pounds; bismuth, 4 ounces; graphite, 8 ounces; aluminum, 4 ounces.

REPORT has it that Hathaway mine, near Ophir, Placer Co., is soon to change hands and that under the new managers its operating force will be increased.

The Cyanide Process.

The MacArthur-Forrest System of Gold Extraction.

In order to understand the present systems of gold extraction, to properly appreciate the work already done, and to gauge the difficulties to be surmounted, it is necessary for us to look back and trace the connection between the known forms of gold as found in nature and the methods used to separate it from its base environments.

In the earliest ages gold would naturally only be found in nuggets and grains (our word *carat* is derived from a Persian word meaning a grain), which required no means of separation beyond picking up—happy age when gold had only to be picked up!

From grains the ancient would come down to gold dust, and this was no doubt separated from the sand or earthy matter with which it was associated, by the skillful use of air currents which were caused to blow away the sand, leaving the precious metallic dust. This method is still practiced in Arabia and the East. Wherever water was plentiful it was found that it did the required separation better and more economically than air, a method of separation which has been and still is in use everywhere all over the world. The prospector, digger, explorer, and even the tourist nowadays provides himself with a "pan" in which to wash a sample of "dirt" at the nearest stream. From the pan comes the "cradle," "long tom," and the innumerable mechanical arrangements for the separation of gold from earthy matters. Up to this point we have only mechanical means of separation which depend on the high specific gravity of gold compared with sand, clay, etc., but at this stage in the evolution of gold extraction we find the first move made toward a chemical method. When there was a lot of rich dirt in his pan the digger found it very difficult to wash away the last of the sand without losing a large proportion of the finely divided gold, so he hit on the expedient of pouring in a little mercury, which formed a heavy, massive, though fluid alloy with the gold, making the separation of the last portions of the light granular sand a very easy matter. This plan is still in world-wide use alike by the solitary digger who lives in a lonely canyon, and by the well-organized company that "hydraulics" 1000 tons of "pay dirt" per day. Let us now look at the

PRESENT STATE OF THE GOLD INDUSTRY.

Let us imagine a digger who has exhausted all the gravel and pay dirt in the canyon or gully; he travels up the gully looking to the right hand and to the left for traces of the precious metal; occasionally he finds a piece of gold-bearing rock and is led on and on till he finds the source of these auriferous stones to be a reef. Now begins gold-mining proper. A shaft is sunk on the reef or a tunnel driven into it and great masses of rock are brought to the surface, and naturally the miner is led to imitate nature by crushing this rock to a fine sand and then he modifies the treatment, formerly given to alluvial deposits, to adapt it to the new circumstances. The ore, immediately on being crushed to powder (which is generally done by huge gravitation stamps), is carried over an amalgamated copper plate by a stream of water. In passing over the amalgamated plate the gold is caught by the mercury, while the sand, now called tailings, is washed off. The gold is recovered by scraping the amalgam off the copper plate at stated intervals, generally once a month, when by distillation the mercury is recovered as well as the gold separated. If all the gold the ore contained existed in the heavy metallic form, the recovery by this method would be complete and the loss nil; but the tailings are frequently found to contain a little gold, and on close examination particles of pyrites and sulphides of the various base metals are found diffused through the mass. When these metalliferous particles are separated from the mass of tailings, it is found that they principally contain the gold, so that it is now usual in practice to pass the tailings through some form of concentrating machinery, of which the well-known *Frue vanner* is a good example, whereby the pyrites and other sulphides are retained in virtue of their higher specific gravity and the sand washed away. The rich proportion now called "concentrates" may contain up to 20 ounces of gold per ton, though four or five ounces is much nearer the average figure.

IF THE CONCENTRATES ARE EXAMINED

Closely, even microscopically, no free gold can be distinguished, and if they be treated with mercury, they will yield to it little or none of their gold contents. Sometimes a considerable portion of gold may be got from them by a long-continued grinding in cast iron pans in presence of mercury. This grinding seems to force the sulphur and base metals, as well as the gold, into com-

bination with the mercury, so that the bullion got from the amalgam often contains over 95 per cent of copper, lead and other base metals, while there is a corresponding loss of mercury which is carried away partly as sulphide and partly in a "floured state." The flouring is caused by the small globules of mercury being coated with a film of sulphide of mercury, which prevents the particles coalescing. Thus there is a double loss—chemical, by the formation of sulphide of mercury, and mechanical, by flouring. This loss is so well known that concentrates are only treated by this form of amalgamation in localities where nature forbids any more elaborate process. Sometimes the amount of loss may be lessened by roasting the concentrates before amalgamation, but this is by no means a perfect remedy, as the roasting removes only volatile constituents of the concentrates, principally sulphur, while the base metals—lead, zinc, etc., are left in the form of oxide to oxidize and waste their equivalent of mercury. Attempts have also been made to decrease the loss of mercury and increase the yield of gold by adding to the contents of the pan all sorts of chemicals to "doctor" the "sickened"—that is, floured mercury. These chemicals are generally mixtures of sulphate of iron, sulphate of copper, salt, lime, soda, etc. This kind of "doctoring" may be effective in some cases, but it is seldom practiced with intelligence. Where the percentage of concentrates is limited, and where there are a number of mines, it is common for some enterprising man to set up a smelting or chlorination work which is made large enough to deal with the concentrates of the district. I will not take time to describe the various processes of smelting, nor could it be done at any evening sederunt; but we may bear in mind that all smelting processes end in alloying the gold with lead, and cupelling in the usual way, with which we are all familiar. Because of the obvious impracticability of smelting, requiring well-built brick furnaces, coal, fluxes, etc., at the typical gold mine high up on the mountain range, possibly near or beyond the timber line, chlorination is much more commonly practiced and consequently merits a full description. In giving this description, I will confine myself chiefly to the old standard Plattner process as I have seen it practiced in California, where timber is abundant and cheap.

THE FIRST AND ESSENTIAL OPERATION

Prior to chlorination proper is roasting. It is obvious that a mixture of sulphides and arsenides of iron, copper, lead, zinc and metals generally will absorb an almost unlimited amount of chlorine, so that the small proportion of gold present would fare badly in a general scramble of the molecules for chlorine. That the metals may have the least opportunity to combine with chlorine, the sulphur is expelled, and their affinities satisfied as far as possible with oxygen by roasting. The roasting is generally done in a large reverberatory furnace, that has no very noteworthy feature in its construction. The concentrates are charged into the furnace at the cold end, heated very gradually, continually stirred and slowly worked forward into the hottest part, care being taken to admit air freely during the whole operation. Where chlorination is practiced on the most extensive scale, this roasting generally takes about 24 hours, and consumes from a minimum of half a cord to a cord of wood per ton, roasted. (A cord of wood gives about as much heat as a ton of coal.) It is a common saying that the success of chlorination depends more on the furnace-man than on the chlorinator, and on looking into hard chemical facts, we find that this is really the case, for if only one-half per cent of iron were left unoxidized it would absorb nearly one per cent of chlorine, equal to about three per cent of bleaching powder, and all this before the gold gets a single molecule of chlorine. Toward the end of the roasting, and about 15 or 30 minutes before the ore is discharged from the furnace, it is usual to stir in a small proportion of common salt. The object of this is to satisfy with chlorine, as far as possible, copper, zinc and other metals whose oxides have a tendency to form chlorides when they get chloride presented to them in the free state. This chloridizing device is, however, only partially effective, as the chlorides formed are apt to be immediately decomposed under the influence of hot air, and in the case of lead, the oxide of sulphur will not combine with chlorine in the furnace, but combines with it readily when offered moist and at the ordinary atmosphere temperature.

THE ROASTED AND OXIDIZED ORE

Is now sprinkled with water to make it slightly moist, and is then charged into a wooden vat having a perforated false bottom. The chlorine, generated at an outside

source, is led in between the true and false bottom, and gradually permeates upward through the mass of the porous ore. The small amount of water held by the ore then becomes a saturated solution of chlorine, which gradually acts on the gold, so that in the course of one or two days it may be washed out as the soluble chloride by a further amount of water. This weak solution of chloride of gold is run into a tank, a solution of ferrous sulphate added, precipitate of gold allowed to settle for 48 hours, if possible, and the supernatant solution allowed to flow off. When sufficient gold precipitate has accumulated, it is collected and run into bars. Besides the Plattner form of chlorination which I have described, there are others which vary from Plattner and among themselves in the manner of application of the chlorine—most of them using revolving barrels instead of open vats for the chlorination proper. The best known of these are:

The Meier's process, where chlorine is used under its own gaseous pressure.

The Newbery-Vautin, where air pressure is used.

The Pollok, recently described before this section of the society, where hydraulic pressure is used, and the Thies, where the chlorination is done in a barrel without any pressure, as described in this journal, 1889, 895.

Let us now return to the mine. The deeper we sink down into the reef, we find that while the richness of the ore may remain constant, the proportion of free gold, that is, amalgamable gold, becomes smaller and smaller, while the proportion of gold-bearing sulphides becomes greater and greater till we come to the water level, where it often happens that the free gold leaves entirely and becomes wholly refractory—that is, nonamalgamable. The water level is generally regarded as the point where the atmospheric and weather influences cease, and that down to that point the rain water has penetrated and gradually washed away the oxidizable base metals, leaving the inert gold in the crevices of the equally inert quartz, whereas, the ore found below the water level, not having been subjected to oxidizing influences, retains all its metals untouched and unchanged.

AN INTERESTING PROBLEM

Now presents itself: An ore consisting of a complex mixture of silica and the various compounds of iron, copper, lead, zinc, antimony, arsenic and sulphur (for convenience I will include all these compounds under the general term sulphides) and gold in the proportion of 10,000 parts of silica and sulphides to one part of gold, is very much richer than the average auriferous ore, and the question is, how can we best separate the one from the ten thousand? Under favorable circumstances, the gold and the useful metals may be recovered by smelting, but these favorable circumstances, which are proximity of the gold mine to coal, clay, limestone and other fluxes, are quite exceptional, as auriferous reefs are generally found in primary formations. As before implied, chlorination is frequently inapplicable—no attempt is ever made to chlorinate gold ore containing an appreciable quantity of lead—and where applicable is always troublesome and never cheap. When this question presented itself to Dr. Forrest and myself, we tried to find some solvent which, unlike chlorine and mercury, would have a stronger affinity for gold than for sulphides. Acting on this principle, we drew out a list of all probable or possible solvents fulfilling this condition. This list included cyanides, and we found that these salts solved the problem.

THE EXPERIMENTS.

Our experiments were conducted first on a small scale, and on ores of all kinds and from all mines in all parts of the world. The result of these small trials was so satisfactory that we gradually worked from less to more, and in no long time larger quantities were worked, and now the process is in or on the eve of being put in operation in all quarters of the globe. I have now much pleasure in describing the method of working most generally applicable. The ore is ground to about the fineness of sea sand. If, instead of ore, we are working tailings from the amalgamation process, these are generally not to reground, but treated as delivered. The finely divided material is mixed with a solution of a cyanide, say cyanide of potassium, containing on an average 0.4 per cent of cyanogen as the cyanide of potassium or other alkali or alkaline earth. The ore and solution are stirred together for about six hours, more or less, this being the average time required to dissolve the gold; in practice the time required is determined by direct experiment. When the gold is known to be dissolved, the pulp is discharged into an ordinary filtering tank, where the filtration may if necessary, be

assisted by suction, and where the ore is washed by water or by the waste cyanide solution from a previous operation. The ore, after treatment with cyanide solution, is unchanged to the eye, as almost nothing but the imperceptible proportion of gold present has been removed. The gold now being in solution, the next object is to get it precipitated, and here we encounter a serious difficulty. Gold and cyanogen have such a strong mutual affinity, that it is difficult to get any substance that will separate them. The gold cannot be precipitated by any ordinary method, such as the use of ferrous sulphate or oxalic acid; even sulphureted hydrogen and sulphide of sodium will not precipitate gold from its cyanide solution, though they precipitate silver. On referring to books on electro-gilding, we got no assistance, as the invariable method given for the recovery of gold from cyanide solutions was, evaporate to dryness and fuse the residue. We had noticed, however, by experiment, that zinc precipitated gold very feebly, and tried this in the same way that copper is precipitated from its ordinary solutions by scrap iron, but scrap zinc had no effect; then granulated zinc was tried; with a most imperfect and disappointing result; then heating in presence of scrap and granulated zinc, but this had only the effect of forming urea, and assisting the precipitation very little indeed. Further, we tried zinc dust, but still there was no success; finally, we prepared some zinc in a form like sawdust, porous and with a large surface of bright metal. On allowing the cyanide of gold solution to trickle through a mass of the zinc, we found that it trickled out gold-free, and better still, we found that the action became more vigorous and pronounced after a portion of the gold had been precipitated on it, doubtless as gold and zinc formed together a more powerful electrochemical precipitant than zinc by itself. An arrangement of a porous mass of zinc like a sponge formed a chemical filter, which at once precipitated and collected the precious metal; indeed, so like an ordinary water-purifying device was this zinc filter, that many nontechnical visitors formed and held tenaciously to the idea that the gold was in suspension in the cyanide solution, and the zinc was used merely because of its durability.

IMPROVEMENTS IN DETAIL.

Were made in the direction of increasing the surface and decreasing the weight of the zinc, till now we have it in threads, 1 lb. of which occupies about two gallons measure. The zinc in this form is possessed of enormous chemical activity, of which the strongest and most direct evidence is the fact that it burns in the air like thin shavings of wood. When the gold has been deposited, it is necessary to separate it from the excess of zinc present. The filiform structure of the zinc, and the exceedingly fine powder, as which the gold is deposited, render this an easy matter. The filiform mass of zinc with gold powder adhering is vigorously shaken in water, when the gold falls off, and the fibrous particles of the zinc may be collected in a sieve. The gold settles easily, is collected, and fused directly into bullion.

Having now described the chief points in the process from the technical standpoint, let us look at the

PURELY CHEMICAL ASPECT

It presents. Reference has already been made to the fact that a cyanide solution acts on the gold in ores in preference to the sulphides of base metals with which it may be combined or associated; this selective action is the keystone of the whole process. It is known that metallic gold is dissolved by a cyanide; it is also known that sulphides of copper, zinc and iron artificially prepared are readily acted on by a cyanide solution; but we found a very different state of affairs in treating ores where these or similar compounds exist prepared by the hand of nature herself. Nature seems to render the base metallic compounds insoluble, while the gold combined with or contained in them is more easily acted on than the metal itself. This at once raises the question—how does gold exist in base refractory ores; is it combined or free? This question I admit I cannot answer satisfactorily to myself. Judging from theoretical considerations only, I think gold should exist almost invariably in the free state, for if we assume that sulphides, pyrites, etc., were formed by deposition from aqueous solution, the gold would be deposited in the metallic state. This may be shown by dropping some powdered pyrites into a solution of chloride of gold, when gold will be precipitated as metal; on the other hand, let us assume that the pyritous formations carrying gold were formed by igneous agency, in this case the gold ought to be metallic, too, because any sulphide of gold already existing would be decomposed

by the high temperature, and of course sulphide of gold cannot be formed at a high temperature. It is true that sulphide of gold may combine with any alkaline sulphide and resist decomposition by heat, but such a combination as a matter of fact does not occur in nature. Telluride of gold, and I think, antimonide of gold are not decomposed by heat, but they occur in small quantities only and do not affect the general argument. In spite of these theoretical considerations, however, we have strong evidence to show that gold exists in several different states of combination or molecular structure. Let me give

ONE CASE IN ILLUSTRATION.

A sample of tailings from the ordinary process of stamping and amalgamation was received, and I think it may safely be assumed that the mercury had extracted some gold from the ore which produced these tailings. We treated the finely ground tailings by alkaline solution of bromine which extracted a considerable portion of gold, and the bromine treatment was repeated time after time till it ceased to extract gold; then it was treated with a hot solution of ferric bromide which yielded a further quantity of gold. This treatment was repeated time after time till it ceased to extract gold, and finally the residue of tailings were smelted and a still further quantity of gold produced. As this ore yielded its gold in stages to the four different processes of amalgamation, treatment with bromine, treatment with ferric bromide and smelting, we infer that the gold existed in four different states, mechanical or chemical. Notwithstanding the complex nature of these tailings which consisted of all sorts of sulphides with the fourfold gold, the cyanide acted on it, almost perfectly extracting 93 per cent of the precious metal, whilst the higher extraction by any of the bromination methods was about 40 to 50 per cent. The cyanogen seemed to have an affinity for gold and a power of penetration so much stronger than mercury of bromine, that it broke through barriers impregnable to them and captured the gold. Elsner has stated metallic

GOLD DISSOLVES IN CYANIDE

Of potassium only in presence of oxygen. Not having seen the original account of Elsner's researches, I am not in the position to criticise his experiments, but I never could find that the presence of oxygen was necessary either to dissolve gold by itself or from ores by cyanide. If a piece of gold be immersed in a cyanide solution so that air to act on it would have to penetrate two inches or three inches of the solution, the gold will dissolve in its usual slow and steady fashion. The equation shows that either oxygen must be absorbed or hydrogen evolved. I have seen no evidence of the former, and can adduce no proof for the latter, but I think the latter the more probable, because I cannot conceive oxygen penetrating even a film of cyanide solution without at once oxidizing the cyanide to cyanate, whereas in the other case, as suggested to me by my friend Mr. Ellis, the nascent hydrogen may be at once seized by the excess of cyanide present and ammoniacal compounds formed. However, we do not concern ourselves much with the reactions of pure gold, but as a matter of fact we cannot find that oxygen plays any part in the cyanide extraction of gold from ores. We have treated an ore with cyanide with free access of air, and then a parallel experiment was done with boiled water, the bottle filled to the stopper with solution and ore, and the stopper sealed. The extraction was the same in both cases.

We have so far only considered ores which are refractory from chemical as well as mechanical causes, but ores are frequently found in which the gold is refractory from a purely mechanical cause, which is the extremely fine division of the gold. The cyanide process is quite as applicable to this class of ore as any other. These ores are generally spongy and absorbent, and this, we find, enables us to dispense with stirring the ore and cyanide solution together, the same end being accomplished by allowing this cyanide solution to percolate slowly through the mass—a clear saving in power.

THE ADVANTAGES CLAIMED

For the cyanide process over smelting and chlorination are: As compared with smelting, it requires no furnaces and no coal, and no fluxes, and thus may be used successfully in remote situations where smelting is utterly impossible. As compared with chlorination, cyanide process involves no roasting, therefore no furnaces and no fuel. Moreover, by the cyanide process, ores containing lead, zinc or earthy carbonates, which cannot be worked to profit by chlorination, may be easily and profitably treated as any other. For chlorination, about seven per

cent of the weight of the ore to be treated often has to be carried to the ore in the form of bleaching powder, say 1½ per cent, bisulphate of soda 2 per cent, and sulphate of iron 2½ per cent, with packing, say of 1 per cent, whereas about 1 per cent of the ore to be treated will cover the weight of the necessary cyanide, zinc and packing. Thus, by chlorination, one ton of chemicals will treat only about 14 tons, whereas by the cyanide method one ton will treat 100 tons.

Moreover, chlorination does not extract any silver, but by the cyanide method the most of the silver—invariably associated with gold in ore—is extracted along with the latter metal at the same operation. For the sake of simplicity, I have not named silver in the body of this paper, but the remarks made in reference to gold generally apply to the silver associated with it.

From what I have seen of gold mines and gold mining in the Sierra Nevada, in the Rocky Mountains, in the Southern States of America, in Nova Scotia, from the many kinds of ore I have seen from all parts of the world, and from what I know of the selective and energetic action of cyanides, I confidently predict that cyanide of potassium, hitherto used only to polish amalgamated plates, will take a front rank as chief agent in gold extraction.—J. S. MacArthur, in *Journal of the Society of Chemical Industry*.

UTAH NATURAL GAS.—Natural gas has been found near Ogden. After boring six days, and attaining a depth of 200 feet, a six-foot flow of perfectly odorless gas was struck. In boring, the drill passed through a shale, which is impregnated with oil. Flows have since been struck in two other wells. The region of country east of the Great Salt Lake shore and the Utah Lake shore has been for many years regarded as rich in oil and gas. At Brigham City, natural gas has been used for three or four years in burning brick and lime. The same thing has been done at Lehi, 22 miles south of Salt Lake City.

In the long fought and important mining litigation, the Old Jordan Mining Company vs. the Niagara Mining Company, Utah, involving the question of which had the apex of rich ore to the ledges, Judge Anderson has found for the defendant and dissolved all injunctions. The interests involved are very heavy, being probably over \$1,000,000. The Niagara will now push work on its claims in Bingham mining district.

AFTER twelve years' litigation, from the Circuit Court in Montana to the Supreme Court of the United States, whose decisions have been made favorable first to one side and then to the other, C. S. Warren, owner of the Butte *Inter-Mountain*, has been accorded the ownership of the Comanche copper mine, in Anaconda, through the decision of the highest court.

NATURAL GAS has been struck near Los Angeles. It is pouring out in large quantities under a high pressure, and appears to possess all the qualities necessary for heat and power purposes. The well has been bored by L. W. Hellman on his ranch a mile or so east of Boyle Heights, formerly known as the Repette place.

THE Virginia *Chronicle* of the 4th says the heaviest bar of bullion ever shipped from the Comstock arrived at the Carson Miot last night. It was from the Con. Virginia and weighed 153 pounds. It was valued at \$3600.

THE Mono County Miners' Association was organized March 1st with 36 members, and officered as follows: President, C. L. Hays; Vice-President, A. J. Severe; Secretary, Clay Hampton; Treasurer, J. A. Brown.

THE San Francisco stockbrokers who are drawing salaries as mining officials may have, many of them, to get back to the commission business again.

ANOTHER Colorado mining boom is in Bonanza, a camp 200 miles south of Denver. Numbers of men are going to the new camp.

ROSS E. BROWNE, the well-known mining engineer, has gone with Felix Chappet to Mexico to examine and report on a mine.

ON account of overstock and scant orders, the puddling crews of many of the Pittsburgh iron works have been suspended.

THERE were 215 lives lost by the explosion and fire in the Charlevoix coal mines, France. The mine has been flooded.

ANOTHER strike of natural gas has been made on the shore of Salt Lake, Utah. A heavy flow of gas has been found.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

THE MOTHER LONE.—Amador Record, March 17: Amador county continues to hold its own so far as its mines are concerned, and the indications are that it will enjoy increased prosperity in that direction. We feel confident that there is to be a general renewal of interest in the mining industry all along the line, and certainly if such should be the case, old Amador is likely to come in for a goodly share of attention. It is quite reasonable to suppose that the past history and the present status of our mines will continue to attract the investment of capital.

THE KENNEDY MINE, situated about three miles south of Sutter Creek on the mother lode, is said to be the best paying gold mine in the State. Last year, it paid the shareholders \$310,000 in dividends. A mine that has made as good a showing as this, is surely worthy of notice, and at some future time we hope to be able to give our readers a full description of the great dividend producer. We are led to believe that a good deal of the success the mine is now enjoying is due to the skillful management of the superintendent, J. F. Parks.

THE SOUTH SPRING HILL MINE, near Amador City, is owned by a Boston company with J. R. Tregloan, an experienced mining man, as superintendent. The mine has been operated for some 12 years past, and has paid handsome dividends. There is a 40-stamp mill, and recently arrangements have been effected for running both the mill and hoisting works by water power. This change will reduce the working expenses considerably. The shaft is down 900 feet.

THE KEYSTONE MINE is located in the same district as the above, and has been a dividend payer since the early fifties, some four or five millions having been disbursed among the owners. The mill has 40 stamps, but at present only 25 are being run. E. T. Hale is the superintendent, and the working force consists of about 70 men. The shaft is down 1400 feet.

THE SOUTH EUREKA MINE is, strictly speaking, a home enterprise, as it is under the control of parties here, although a portion of the stock will go to parties in San Francisco whenever certain conditions are fulfilled. The company was organized through the efforts of Jackson Dennis of Sutter Creek. The shaft has three compartments, and is down a depth of 465 feet. At present, the indications are considered very favorable for encountering the vein. It is in a direct line with the mother lode, and it adjoins the famous old Enreka mine, which was worked to a depth of 2200 feet and was yielding \$60,000 a month when the works were destroyed by fire. It is the universal opinion that the company is on the right track, and will ultimately develop a fine property. The mine is under the superintendency of J. F. Parks, while A. Reily is the foreman.

THE BELMONT MINE adjoins the Lincoln and Hector mines and is but a stone's throw from town. At present, the ten-stamp mill is running on surface ore. The vein is worked 10 to 20 feet in width, and is worked through a tunnel five by eight feet in the clear and 600 feet in length. On the northern portion of the claim a shaft has been sunk 75 feet. The water being too strong for their present power, operations in that quarter have ceased temporarily. The company proposes substituting steam, which will enable them to explore on deeper levels. The future for the mine is very encouraging, as the vein has been exposed several hundred feet in length, and as depth is attained, and the vein concentrated between well-defined walls, wonderful results may be looked for from deeper levels. James Tibbets, the company's superintendent, manages its affairs in a capable and practical manner.

THE WILMAN MINE, which is located at Sutter Creek, is rapidly coming into prominence as a bullion producer. The mine is fully equipped with all the modern improvements, consisting of a complete water hoist, one of Knight & Co.'s hydraulic pumping engines, air compressor and a complete set of circular and upright saws for framing timbers. Thirty stamps constitute their milling plant, and it is supplied with improved rock breakers and Frue and Triumph concentrators. A shaft has been driven down 900 feet. The milling ore comes principally from the 800 foot level from a vein 40 feet in width in a granite formation. Occasionally, large layers of the latter material are encountered in the vein, thereby reducing the value of the ore. The company now sorts the ore, and as a consequence only ten stamps are kept running at present. On the 900 foot level, stations have been cut and drifts run into the ore chute where the vein is free from granite, which is so frequently encountered on the 800 level. Supt. John Tregloan informs us that it will not be long before stopping will be in order on the lower level and the mill running to its full capacity.

Calaveras.

ANGELS.—Calaveras Chronicle, March 19: The Utica Company are preparing to erect an additional 40-stamp mill on the Stickles mine.

PUTTING UP MILL.—Messrs. Pellaton, Pfeiffer, Fisher and Wait, owners of the Democrat gravel mine, in Tunnel Ridge, are erecting a three-stamp mill and have it nearly completed. The mill purchased is the one formerly used on the Tuttle mine, in Chili gulch. It will be but a few days before the mill will be in operation.

QUAKER MINE.—The work of sinking the vertical shaft in the Quaker quartz mine is progressing favorably under the careful attention and intelligent management of our friend Hugh McSorley, who has been installed as the

superintendent. The shaft will be sunk 200 feet, when it will then have attained a depth of 600 feet.

MILL MOVED.—The 40-stamp mill on the Ilex mine, near Rich gulch, has been taken down and is now being moved to Angels. A number of large teams are engaged in the transportation.

LUCKY.—Mrs. Fred Mayer, of the Monitor House on Center street, was the lucky finder of a nugget of gold, valued at \$5, while working in her flower garden adjoining the Monitor House.

Nevada.

GOLD BEARING QUARTZ NEAR TRUCKEE.—Grass Valley Union, March 18: J. E. Gudden was fishing up the Truckee river Wednesday morning and discovered gold-bearing quartz. He was searching for willow worms for bait in a stream that flows down across the stage road, when he discovered the rock. There are several pieces showing free gold. There is much excitement over the matter, not only because of the specimens discovered, but because there is known to be a rich ledge in that vicinity. The ruins of Knoxville and Elizabethtown are silent witnesses of the fact that there was once a tremendous mining excitement not far from that region. Hundreds of people flocked to this country and started full-fledged mining towns. There were fair prospects to be obtained in many places, but the main ledge could not be found and the excitement subsided. Gudden's discovery is three or four miles nearer Truckee than Knoxville, and it may be he has found the croppings of the long-sought gold mine. Years ago a landslide occurred on the west bank of the Truckee river, opposite the old Fish ranch. Many particles of free gold were panned out of the earth that was uncovered. There is a rich ledge somewhere close to the river, and we hope Gudden has found it. Immediate steps will be taken to thoroughly prospect the region.

HUNSON BAY MINE.—Grass Valley Telegraph, March 16: For some time past Mr. Alf. Tregidgo has been working the Hudson Bay mine, situated a few hundred yards north of the North Star mine. The ground is owned by Martin Ford and others, and a long time ago some very rich ore was taken from a prospect hole on the property. A new shaft has just been sunk by Mr. Tregidgo and is now down about 80 feet. Water has been reached and machinery will be immediately placed on the ground.

W. Y. O. D. DIVIDEND.—Grass Valley Tidings, March 18: The directors of the W. Y. O. D. mining company, of Grass Valley, have declared dividend No. 7, of ten cents per share, aggregating \$3,000. To date, the mine has paid for a splendid hoisting, pumping and milling plant and \$15,000 in dividends, and there are many more dividends in sight.

THE W. Y. O. D. MINING SUIT.—Grass Valley Union, March 16: Frank Richards, on behalf of himself and others, has brought suit against the W. Y. O. D. Mining Co. for the value of certain shares of the company, estimated at \$30,540. This suit is based on what is claimed to have been an agreement on the part of the company to pay certain miners for labor in part cash and part shares of the company, upon condition that the stock should be unassessable. The complaint says the company did not keep this agreement, but subsequently assessed the stock and sold it out for non-payment of the same, and that the stock so sold is now of the value as sued for. The W. Y. O. D. officers say they do not attach much importance to the suit; that the plaintiffs have no valid claim, and that the suit would never have been thought of had it not been that the mine is now proving valuable. Some of the parties named never complied with an agreement to work, and none claimed or demanded stock, and, besides, the company never agreed to issue unassessable stock.

Placer.

TWO GRAVEL CHANNELS AND ONE CLAIM.—Grass Valley Tidings, March 18: The great Mayflower drift mine near Forest Hill, in Placer county, continues to send out good reports. Some two years ago, in working up the channel in this mine, they cut through another gravel channel at right angles, which was lighter in color, softer and more easily worked than the Mayflower, and which they named the Oreno. The Mayflower had apparently been cut in two by the Oreno, and, after crossing the latter a distance of nearly 200 feet, they came into the Mayflower again, and have continued up that channel, and have worked it, to date, for a distance of about 8000 feet. The company own the Oreno some 7000 feet, and recently they have commenced operations on this channel. The returns from it are very encouraging. One run of 29 tons recently yielded \$6 per ton, and a still later run of 94 tons yielded \$7.75 per ton. The channel will average over 100 feet in width, and when one estimates the amount of gravel that lies in a channel averaging 100 feet in width and 7000 feet long, and figures it at say \$7 a ton, he can form some idea as to the amount of wealth insured to the Mayflower Company by the apparently accidental but fortunate discovery of the Oreno channel.

DRIFT MINE.—Placer Herald, March 12: The Harmon drift mine, a few miles east of Rocklin, is working about 20 men and report says it is paying big. Some of the gravel is said to go almost an ounce of gold to the pound.

Shasta.

BIG MINING EXCITEMENT.—Redding Free Press, March 19: The recent rich discoveries of silver ore in the Igo district are creating much excitement and bringing into the districts many locators. The rich mineral belt is about four miles long and a little over a mile wide. Fully 50 persons have located. One man, to be sure of getting enough of a good thing, has located 25 claims. All along the belt can be found location notices, and the excitement runs high.

Several have gone over from Redding and secured claims. The ore contains both gold and silver, and until water is reached the pure stuff can be scraped off the rock. When the water is reached, the ore becomes base. Tisher & Zoellin have taken out four tons of rock in going 15 feet, which will go \$200 to the ton. Groener & Richter have sunk on a ledge, and it is said that wire silver can be seen in the quartz. O. Engle of Igo was over Wednesday, and he gave us the following reliable information: Enbanks, who is now running a tunnel to tap his ledge 60 feet deep, recently shipped 17 sacks of ore, getting a return of \$112.80. John Wright shipped 14 sacks and received therefrom \$160. Mr. Budd, with 44 sacks, netted \$500. This is a pretty good showing and shows rich rock. Mr. Rothwell, the pioneer miner of this section, bonded his mine some time ago to San Francisco parties, who have run tunnels and sunk shafts, taking out more than enough money to pay expenses. They have until May 1st to buy the mine for \$25,000, and there is scarcely a doubt but that they will secure it. It is expected that in a few months there will be erected a plant near by, thus obviating the necessity of shipping the ore. A man named Patrick Marley has some 20 men employed in clearing away for a mill site and furnace.

MINING ITEMS.—John White, the carpenter, has a splendid mining prospect on Clear Creek, near Shasta, and thinks that he will in future devote the most of his attention to mining. He is preparing to ship some of his rich ore. News comes from all over the county indicating that our mining interests will boom during the coming spring and summer. In Whiskeytown, Col. Moore and J. S. Strode are preparing for extensive mining operations. Another year, and the mines of Shasta county will have made great advances. O. Engle has sold a half interest in the Flicker mine on Kanaka gulch, opposite Mule Mountain, to the Hoskin Bros., Cornish miners. The price received was \$1000. This mine contains rich gold quartz. As high as \$2 has been panned out of a pound of the ore, and some of it goes as high as \$4000 to the ton. Mr. Engle, being a poor man, was unable to operate the mine alone. J. H. Morton has bonded the Yankee Blade and contiguous mines, located on the road to Iron Mountain, between Shasta and Spring Creek, near the Mike Wels place. A working fund has been deposited in the bank and a force of men will be employed in running tunnels and sinking shafts. If, after proper investigation, there appears to be a mine there, machinery will be put up. The property has been bonded of Dick Moline, who purchased the Pehrson saloon. The ore assays well. Colonel Stevenson, a San Francisco mining man, representing English capital, has bonded the Ed Reid mine, adjoining the Mammoth and Central mines, in the Old Diggings district. Several tunnels have been run on the Reid mine, but no substantial development work has been made. There is, however, a good ledge three feet wide, with ore assaying as high as \$95 to the ton. Colonel Stevenson will run a new tunnel, and endeavor to open up the mine in good shape, and, if it turns out as he expects, machinery will be put up and the property worked for all there is in it.

MINING SALES.—Shasta Democrat, March 16: The group of mines in Old Diggings district known as the Reid mine, and owned by E. A. Reid, John Salvave, W. H. Clendennen, and T. E. Dix, has been sold under a stipulated agreement to Robert Stevenson of San Francisco. The agreement runs for two years, and under it Stevenson agrees to give them \$5000 on the first day of April, 1893, and \$20,000 on the first day of April, 1894. Stevenson takes possession the first of next month, and will proceed to thoroughly develop the property. A. T. Molin, V. A. Molin, and John Wright have sold their claims situated on Spring creek, near the old Stump ranch, to Robert Stevenson and J. H. Morton for \$3000, the sale to be consummated in accordance with a stipulated agreement, on or before the 27th day of next November. We understand that the purchasers of this property intend to soon put up a milling plant on the same.

Sierra.

KEYSTONE.—Mountain Messenger, March 19: Six men are working at the Keystone quartz mine, owned by Senator M. H. Mead. Good paying ore, of which there is a large amount on hand, is being crushed at the mill.

Siskiyou.

QUARTZ AND PLACER.—Yreka Journal, March 16: J. H. Van Nader discovered a fine five-foot ledge of quartz on Humbug last week, which prospects from \$15 to \$20 per ton, creating much excitement on the creek, as it is the largest lode yet discovered in that district. It is in the neighborhood of the Hegler & Aldrich quartz mine, and gives promise of being a permanent lode of great value. Jos. Travelli and Tom Baxter have also located an extension on the ledge discovered by Van Nader, which is believed to be quite as extensive. Work will be commenced in sinking shafts and opening the ledge to fully determine its permanency. Ed. Sheffield finds good prospects and is taking out good pay from the Uncle Sam quartz mine at Salmon river, which is 12 feet thick at surface and also in the tunnel at 500 feet below the surface. The Gold Ball Mining Co. is taking out exceedingly rich quartz, and rumor says the owners of the mine are considering a proposition to sell for half a million dollars. The Ballarat Mining Co., at work in the old Chinese hydraulic claim on Spring gulch, at northern boundary of Yreka, finds considerable water to contend with, and may be obliged to put up more powerful pumping machinery to reach bedrock under the cement bottom washed by the Chinese. There is no doubt that rich pay will be realized on reaching the bedrock, and cause a general working of Yreka Flats, where many suppose the shallow diggings of

early days have a deeper strata of rich gravel under later bedrock and cement.

THE HYDRAULIC MINES at Quartz Valley, Oro Fino, Pinery and other sections on west side of Scott Valley, have commenced piping, since the late warm weather fills the ditches with water, by melting the great snowbanks on the Salmon range of mountains. The miners in these localities expect to take out more dust this season than ever before, as there will be a good supply of water until later in the season than usual. The Scheld Brothers are now busy at work in their claim in Greenhorn gulch, where the pay gravel is improving in richness. Owing to spigate water from above, they have considerable trouble in working, especially since the rain storm and filling up of the big ditch some distance above the claim.

PORTUGUESE COMPANIES at Hawkinsville have fixed up the big ditch to some extent, so as to get a supply of water from Forest House creek to their claims at Hawkinsville. They have an abundance of water, but the flumes at Greenhorn creek, Greenhorn gulch, Long gulch and Humbug gulch leak so badly that only a limited amount can be secured at Hawkinsville. They will be able, however, to take out considerable gold dust before the water supply slacks up, and if new flumes were built, could mine all summer. Lee, Lash & Co. have suspended work in their blue gravel claim at Greenhorn, in consequence of the great amount of water to handle, resulting mainly from so much leakage of the dilapidated flumes of big ditch. As soon as the water slacks up when hot weather comes, they will start their steam pump again, to reach bedrock in their new shaft near the Yreka and Scott Valley stage road.

HUMBUG CITY, at Forks of Humbug, which was quite a place during the '50 period when placer mining was carried on with great success, is coming to the front again as an important business center, by reason of the quartz mines turning out well in the yield of gold. New buildings are being erected for store, hotel and postoffice applied for, which, with the quartz mills near by and other houses, will make that place resume its prosperity and appearance of pioneer days. In addition to being a central trading point for the quartz and placer mines along the creek and all its tributaries, Humbug City will also be a station for change of horses on the Yreka and Oak Bar stage line, running from Yreka to the Klamath river mining sections, and is only about a quarter of a mile above the crossing where the stage to Honolulu crosses the creek from Yreka, so that parties can reach Humbug creek by either the Oak Bar or Honolulu stages, the former going up the creek to Little Humbug in reaching the Klamath, while the latter passes down the main creek to Lower Humbug and the Klamath.

THE BELLERET MINE.—Telegram, March 18: Work on the shaft of the Belleret Co. mine, on the flats north of town, is being carried on with all the speed possible, as they have a vast amount of water to handle which necessarily makes it very slow work; but with all this, they are down somewhere in the neighborhood of 30 feet. The Telegram called on them the forepart of the week, and was delighted to see the gravel they were getting from the bottom of the shaft, which by the way carries some gold, small iron cubes and a vast amount of black sand. They expect to strike bedrock in five or six days. Should it pay wages, the work will be prosecuted to its fullest extent, and should they strike rich, there will be in the neighborhood of a thousand men at work on the flats inside of two months, making the old town of Yreka appear as she did in the early fifties.

Tuolumne.

POCKETS.—Tuolumne Independent March 16: It was rumored nearly two months ago that A. W. Stinchfield had struck a pocket in his mine at Jackass Hill. We were unable at the time to verify the report, and have refrained from making a statement concerning the matter until we could be satisfied that it was correct. A number of well-known residents of the Hill have since told us that Mr. Stinchfield's pocket was a little over \$6000. It was reported at the time that he had taken out \$10,000. Isaac Copeland of Vallecito was in town Saturday. He is foreman for the Vallecito Mine Company, which is making arrangements for hydraulicking a gravel claim. Hank Gale has purchased Urban Conklin's interest in the pocket mine on Thompson's Hill, known as the Conklin & Lawson mine. The prospect is very fine, and Gale & Lawson will push the work of development. The mine has already furnished several handsome pockets. A. W. Stinchfield of Tuttle town has been drifting under Table Mountain and has found the pay gravel of the ancient river bed. It is said that he is getting some of the largest nuggets that have been found for years. The Last Chance, or Colby claim, owned by Conrad & Colby, situated in Sonora, was leased last May by Oliver, Johnson, Kelly and Dart. Colby, it is understood, took out \$42,000 while he was working the claim. Since the present lessees have worked the mine, they have taken out \$13,000 from one pocket, \$4000 from another, and smaller lumps aggregating \$200 more. They are now working on the English reef of slate. Lee McPherson, who is supposed to have found the old, lost Nigger Gulch lead, on the Jarvis ranch, north of Columbia, now has men working night and day. Work has been stopped at the Platt & Gilson mine at Soulsbyville, the vein having pinched out. The parties who were working it have purchased the Gerry-mander mine, near the Golden Gate, and will prospect it thoroughly. Uncle George Norton is still working his claim in the northern part of town, hoping to find a hunch such as rewarded his labor in the same vicinity in early days. He has a very fine body of quartz and a large vein of the very finest kind of slate, which, when he reaches the crossing, may

show a handsome hunch of gold. He finds some very pretty pieces of gold occasionally.

NEVADA.

Washoe District.

CON. CAL. & VA. MINE.—Enterprise, March 19: There has been extracted from all parts of the mine during the week 1020, 1790, 2000 tons of ore, which was shipped to the Morgan mill. The average value of all of the ore worked at that mill during the week, 980 tons, was \$20.75 per ton. Bullion shipped to the Carson Mint, assay value about \$15,184.30.

OPHIR.—1465 level.—The crosscut running east from the drift run north from the drift run west from the winze 122 feet below the sill floor of the 1300 level, has been advanced 21 feet; total length, 32 feet; in porphyry and quartz of low assay value. Have continued the work of repairing and retimbering the main south drift on this level. Shipped to Eureka mill 200, 380, 2000 tons of ore. The average assay value of all the ore worked at that mill during the week, 53, 1350, 2000 tons, was \$18.08 per ton.

MEXICAN.—On the 1465 level, the crosscut running east from the bottom of the winze sunk 101 feet down from the end of the crosscut run west 132 feet in from the main north lateral drift near the south boundary of the mine, has been advanced 20 feet; total length, 155 feet; the face is in soft porphyry.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 20 feet; total distance west from the shaft, 1760 feet; the face is in porphyry. From the Union Con. south lateral drift from the joint west drift, at a point 1570 feet west from the shaft, a west crosscut started near the south line of the mine has been extended during the week 22 feet; the face being in porphyry and clay.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft 1750 feet; face in porphyry. The north drift from the Kenosha tunnel was advanced 40 feet; total distance, 751 feet; face in porphyry.

UTAH.—The west drift from the shaft station, 340 level, was extended 70 feet; total length of 280 feet, continuing in a porphyry formation showing some water.

ANDES.—On the 420 level, north drift from east crosscut No. 4 advanced 13 feet; formation porphyry. Suspended work in face of this drift for the present. To-day started a west crosscut from this drift, 99 feet south of the face. West crosscut No. 1 from north drift extended 5 feet and stopped for the present. Have been easing timbers in main north drift.

HALE AND NORCROSS.—On the 900 level, the north prospecting drift started from the top of the north upraise was advanced 10 feet; total length, 45 feet; face in quartz. On the 1500 level we have resumed work in No. 1 winze, started 75 feet north of the incline, and sunk same 5 feet; total depth, 15 feet. Bottom is in quartz showing some pay ore. We resumed work in No. 2 east crosscut and advanced same 10 feet; total length, 35 feet; face in porphyry. This crosscut will connect with No. 2 winze from 1500 level and give us ventilation on both of these levels, and enable us to open an intermediate level between the 1500 and 1630 levels.

BEST AND BELCHER.—900 level, east crosscut No. 1 has been advanced 20 feet through porphyry and seams of quartz; total length, 35 feet. All work in west crosscut during the week has been on repairs.

GODD AND CURRY.—200 level: Northwest drift, 435 feet west of shaft, has been extended 20 feet through soft porphyry; total, 112 feet. South drift from upraise No. 2, 65 feet above this level, has been extended 12 feet through quartz giving low assays; total length, 64 feet.

CHOLLAR.—Are making repairs on 400, 550 and 650 levels. The south drift from joint west crosscut, 1640 level, is out 144 feet; face in porphyry.

BILLION.—Are resiping south drift, 1300 level. The joint west crosscut, on north line, 1300 level, is out 42 feet; face in porphyry. The east crosscut, 120 feet south of north line, 1500 level, is out 191 feet; face in porphyry. The southwest drift from Ward shaft, 1800 level, is out 1235 feet; face in a mixture of porphyry, clay and low-grade quartz.

WARD COMBINATION SHAFT.—The southwest drift from the shaft, 1800 level, is out 1235 feet, face in a mixture of porphyry, clay and low-grade quartz.

ALPHA.—The west crosscut from north drift, 550 level, is out 8 feet; face in low-grade quartz. The southwest drift from the Ward shaft, 1800 level, is out 1235 feet; face in a mixture of porphyry, clay and low-grade quartz.

EXCHEQUER.—The east crosscut, 150 feet south of north line, 600 level, is out 316 feet; face in porphyry.

CON. NEW YORK.—The raise from No. 4 west crosscut, 650 level, is up a distance of 53 feet; top in quartz showing hunches of fair ore.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 590 feet; face in gypsum and porphyry.

ARIZONA.

PROSPECTING.—Prescott Journal-Miner, March 16: Since the strike by Butler & Wright on the Dividend, a mine that heretofore nothing was expected of, the country adjacent has been swarmed with miners eager to lease or in any way acquire properties. Prospectors are reported in large numbers, and a district which has been slumbering in inactivity is now reported prosperous and thrifty. The new strike of Messrs. Thompson, Gleason & Rowe continues to show up well in rich ore. These claims, as far as developed, show up richer than anything yet discovered in this section. The claims are located about nine miles south of Prescott, in the Hassayampa district. John S. Jones is ready to start his new mill on Big

Bug on ore from several of his claims. He has a complete and improved concern, and will do custom work shortly. He uses water as a power to run the mill, but will substitute steam later.

BRADSHAW BASIN.—Work on the Crowned King, at Bradshaw Basin, is to be resumed at once. A general supply of merchandise and other articles is being shipped from Prescott to last through summer. Water is in abundance in that country at present, but the transportation facilities as usual are bad.

THE BOYCUS SYSTEM of placer mining will be introduced in the Stanton gold fields. S. E. Fuller, to whom can be given the credit of inducing the capitalists to take hold of the proposition, is at present on the ground, and, as stated before leaving Prescott, that though the system is comparatively an old one, it has been in successful operation recently in many localities of the West under the improvements which have been made to it of late. The amalgamation process was used, so there is no possibility of the loss of gold, no matter how fine the metal may be, or whether the ground be wet or dry. This system, under its improved order, is receiving considerable attention from the press and public, and promises to be a boom to the placer mining element.

AT WORK.—Since the Supreme Court has handed down its decision in the celebrated case of Clay vs. the Silver King Mining Company, on Groom Creek, which was in favor of the company, a force of 20 men has been put to work on the mine, under the superintendency of Mr. Barstow. Two shifts are at work sinking, drifting and stopping. The mine looks better after every shot, and gives every indication of developing into a bonanza. The first-class ore is sacked and shipped to Prescott, while the Greenwood mill, near by, reduces the second grade. Returns from a recent shipment gave a 400-ounce return in silver per ton.

HYDRAULICS.—The recent cleanup at the Lynx Creek hydraulics, on an 18 days' run, gave as result several thousand dollars of the yellow metal. The run was very satisfactory and was made for the benefit of Mr. McIlraith, the Secretary of the company, who is on a visit to the works at present from England. The success attending this enterprise in past runs has stimulated the company to such an extent that the rebuilding of the dam will be commenced at once, while other propositions calling for the expenditure of many thousands of dollars show a faith in our various interests commendable of this company's liberality and push, which we are glad to chronicle.

DIVIDEND.—Butler & Wright, who arrived in this section recently from Colorado, and secured a lease on the Dividend mine in Big Bug from Judge John A. Rush, are meeting with deserved success, and at the same time demonstrating that before you can lay claim to a mine you first have to go down on it. The Dividend is one of the first mines patented in Northern Arizona, and has a history in its early life filled with extreme interest, being the scene, in the '60's, where many miners fell by Apache warfare, making the district thereby one of insecurity to life and an impossibility to prospect in. The original workings on this mine were cleared of the debris, and the indications being such in the eyes of the present lessees as to warrant sinking, they undertook the work, and have been handsomely rewarded. The same gentlemen have also secured a lease on the Little Jesse, an extension of the Dividend, with likewise good results. It is stated that during the last three months \$15,000 has been taken out by this firm, and that, too, from claims which have been passed over by the prospector for years as not even worthy of the experiment a stick of giant powder might reveal if exploded in the right place.

NEVADA.

Tuscarora District.

NAVAJO.—Tuscarora Times-Review, March 18: South drift, 350-foot level, extended two feet. Have started a winze below the 350-foot level, on a small stringer of rich ore.

BELLE ISLE.—East crosscut No. 1, 350-foot level, extended eight feet. West crosscut, same level, extended 19 feet.

NORTH BELLE ISLE.—West crosscut south, 400-foot level, extended 12 feet. North intermediate, above the south 500-foot level, extended 11 feet; vein not looking as well. No. 4 north drift, south 500-foot level, extended 24 feet, showing some low-grade ore.

NEVADA QUEEN.—Eighty eight cars of second-class ore, average assay \$49 per ton, and three tons first class, average \$336 per ton.

DEL NORTE.—Second level: Stopes produced 18 cars of ore. Have started raise east from the No. 1 raise. Third level: No. 1 raise has been put up 22 feet; will cut the vein this week. Shipped 25 tons of ore to sampling works; average assay \$275 per ton.

NORTH COMMONWEALTH.—Second level: Stopes have produced 23 cars of ore, assay value \$50 per ton, and two tons assay value \$300 per ton.

OREGON.

MACHINERY ARRIVAL.—The arrival of large shipments of mill machinery for the mines adjacent to Baker City gives assurance of more extensive mining operations than ever before known in the history of the county. The machinery for the Bailey-Elkhorn mine purchased by Mr. L. W. Nelson on his recent visit to San Francisco is beginning to arrive, and as fast as unloaded from the cars, will be taken to the mine. Yesterday one of the Bryan mills was received, together with other machinery. There is a delay in the shipment of the other Bryan mill on account of its construction not being completed. It will arrive, however, in a few days. The machinery for the ten-stamp mill for the Virtue M., M. & D. Company is, also, arriving and being forwarded to the Virtue mine by wagon.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized.

The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. B. EVERETT.....Ass't Secretary.
H. PICHOR.....Treasurer.

VICE-PRESIDENTS.

NAME.	COUNTY.
R. F. Grigsby.....	Napa
Henry Martu.....	Trinity
Geo. W. Thomas.....	Marin
Frank R. Webe.....	Sierra
Woolston Banghart.....	San Mateo
R. H. Campbell.....	Siskiyou
Jas. O'Brien.....	Yuba
Frank Fitzgerald.....	Inyo
A. B. Call.....	Amador
Dixon Brabban.....	Plumas
J. F. Ryan.....	Humboldt
Aaron Bell.....	Shasta
H. O. Harvey.....	Sacramento
D. K. Perkins.....	Butte
A. M. Hardie.....	San Luis Obispo
A. Tregidgo.....	Nevada
Ex-Gov. H. G. Blaisdell.....	Alameda
T. B. Morse.....	Calaveras
Hon. A. M. Clark.....	Fresno
Hon. J. K. Luttrell.....	Sonoma
J. J. Crawford.....	El Dorado
R. M. Folger.....	Mono
Geo. F. Hoyle.....	Orange
R. McMurray.....	San Francisco
W. S. Chapman.....	San Francisco
I. C. Stump.....	San Francisco
C. T. Lacy.....	San Francisco
A. J. Ralston.....	San Francisco
John W. Maxwell.....	Tuolumne
Hon. R. Clark.....	Colusa
C. F. Reed.....	Placer
Chas. Bogan.....	Mariposa
James H. Lawrence.....	Merced

EXECUTIVE COMMITTEE.

Hon. J. H. Neff, Placer.	H. A. McCraney, Lake.
Louis Glass, San Francisco.	Jas. Tunstead, Marin.
Col. Dan M. Burne, S. F.	A. M. Bryant, Mono.
Col. F. McLaughlin, Butte.	W. K. Alderley, Napa.
S. K. Thornton, S. F.	Chas. Bogan, Mariposa.
Wm. Ireland Jr., S. F.	Jas. H. Lawrence, Merced.
Hon. C. W. Cross, Nevada.	Hon. J. M. Walling, Nevada.
Chas. G. Yale, San Francisco.	D. C. Pilex, Orange.
J. B. Hobson, Placer.	John Spaulding, Placer.
Hon. Edw. Coleman, Nevada.	W. W. Kellogg, Plumas.
Hon. A. Walath, S. F.	M. M. Drew, Sacramento.
Hon. J. K. Luttrell, Sonoma.	Thos. R. Church, S. F.
Ex-Gov. H. G. Blaisdell, Alameda.	John Hays Hammond, S. F.
Hon. Joo. Daggett, Siskiyou.	Myron Angel, S. L. Obispo.
Hon. E. O. Voorheis, Amador.	N. J. Brittan, San Mateo.
E. W. Fogg, Butte.	George M. Pinney, Sierra.
John F. Davis, Calaveras.	R. G. Hart, Shasta.
John Boggs, Colusa.	A. W. Dana, Sonoma.
Hon. Thos. Fraser, El Dorado.	A. Hewell, Stanislaus.
Mr. McDonald, Fresno.	O. P. Berry, Sutter.
W. H. Pratt, Humboldt.	O. McMunnahao, Tuolumne.
Hon. Patrick Reddy, Inyo.	G. O. Kimball, Tehama.
J. O. Miller, Kern.	John McMurray, Trinity.
	O. G. Mayo, Yuba.

FINANCE COMMITTEE.

Louis Glass, San Francisco	Edward Coleman, Grass Valley.
Wm. Ireland Jr., S. F.	S. K. Thornton, S. F.
N. J. Brittan, San Mateo.	John Hays Hammond, S. F.

COMMITTEE TO FORMULATE AND PROMOTE THE ADOPTION OF AMENDMENTS TO MINING STATUTES.

Hon. Niles Scaries, of Nevada	J. M. Fulweller, Placer.
Hon. O. W. Cross, S. F.	H. I. Thornton, S. F.
	Hon. J. K. Luttrell, Sonoma.

COMMITTEE OF CONFERENCE WITH RIVER AND HARBOR CONVENTION COMMITTEE.

R. G. Hart, Shasta.	Wm. Ireland Jr., S. F.
Frank McLaughlin, Butte.	J. B. Hobson, Placer.
Hon. J. K. Luttrell, Sonoma.	

DELEGATES TO WASHINGTON.

Hon. Niles Scaries, of Nevada County	
Hon. J. K. Luttrell, of Sonoma County.	
Robert McMurray, of Nevada County.	
J. B. Hobson, of Placer County.	

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

Sec. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

Sec. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

Sec. 3. The President and Secretary of the Association shall be ex officio President and Secretary of the Executive Committee.

tion shall be ex officio President and Secretary of the Executive Committee.

Sec. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

Sec. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

Sec. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in each sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

Sec. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in each sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

Sec. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

Sec. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

Sec. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as each County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittee as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

Sec. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of an annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

Sec. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

Sec. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

Sec. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

Sec. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of each intended meeting.

Sec. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

MECHANICAL PROGRESS.

Plating Iron with Aluminum

The vast difference separating the electro-deposition of metal upon an article the size of a spoon, and doing the same work on the exterior surface of a building of massive proportions, can be readily appreciated. The difficulties encountered in electroplating pieces of large size are far greater in proportion when the work is applied to specimens of insignificant dimensions. Yet the Tacony Iron and Metal Co. at Tacony, Phila., has taken a contract to plate, electrically, a surface of material of nearly 100,000 square feet. The contract is for plating the upper part of the tower of the Philadelphia public buildings. The unusual part of the work is to be found not only in the great size of the separate pieces to be handled, but also in the material with which it is intended to cover the entire exterior. This is the first case of any magnitude whatever in which an attempt has been made to plate iron with aluminum. The tower is now finished for a distance of 335 feet from the ground, and from that point, the remainder to a height of 548 feet from the ground, or 213 feet additional, will consist of an exterior of cast iron, conforming in its architectural aspects with the lower stone portion, and supported by an interior framework of iron.

A recent visit of a representative of the *Iron Age* to the works of the Tacony Co. showed that extensive preparations had been made in order to successfully carry out this work. A large building has been erected, at the entrance of which one first sees six long tanks arranged in two rows of three each, and running down one side of the building. These tanks are made of yellow pine and measure 26 feet long by 8 feet deep and about 5 feet wide, and in them all the operations of preparing and plating the different members of the structure will be carried on. To illustrate the method pursued, we will suppose that a column of cast iron is to be plated with aluminum. At its entrance into the building, it is attached to an overhead trolley, running on a track extending parallel with the first row of tanks, or the one next the wall of the building. In these tanks it is cleansed and brought to the proper condition, and at the end is taken by a cross track where it enters the first tank of the second row. In this the final work of preparing the column is accomplished, and in the next tank, or the fifth from the start, the metal is electrically deposited. The final or sixth tank performs the washing operation, after which the column is taken from the building.

Each tank rests in a separate or independent cement pit, the top of which is on a level with the floor, which is also cemented and properly inclined so as to drain well, and in the cement pit so formed the wooden tank is placed. The pit is then filled with water, this construction being followed in order that the pressure of water upon the inside of the wooden tank may be counterbalanced by water pressure upon the exterior. Any shape can be handled, and any dimension that will go in the tank, or that is not over 26x5x8 feet, can be plated. The plating will consist of pure aluminum placed directly on the iron. An extended series of experiments which have been carried on at the works have shown that it is possible to plate economically with aluminum directly on the iron or to plate with the aluminum on a first deposit of copper.

Taking Slack of Towing Hawsers.

In these days when tow boats are so universally employed, even on ocean service, and especially on the Great Lakes, any improvement in methods or detail which will add to security or enlarge the sphere of activity is of great importance. Both on the Atlantic and on this coast, it is now becoming more customary to tow large rafts of logs for considerable distances at sea. In the case of loss of propeller or other accident, where it becomes necessary for one large steamer to tow another, the greatest trouble arises from liability to breakage of the tow rope, from sudden strains. An invention has lately been put into application which will doubtless be largely used in the future as it overcomes the greatest difficulty in towing. It is a steam engine device for taking up the slack in a towing hawser, and again paying it out as the irregularities of both tow boat and the boat towed, require, in irregular or rough seas.

This improvement has recently been tested under severe conditions, which put it in the shape of a complete success. The steamship *Saturn* of over 2200 tons, is fitted with this device, and on the Atlantic has

made two important and successful attempts to tow large ocean steamships in heavy weather, and to the astonishment of the officers of the ships towed, has proved beyond all reasonable question its capacity to do well and securely what is expected of it.

The invention as described by John M. Batchelor in the *American Contractor* consists of a drum on which the towing hawser winds, and connected to the drum are two small steam engines of sufficient power to offset the resistance of the vessel towed. When a rough sea puts a greater strain on the hawser—which in the present case is a steel cable—the engines permit its paying out until the resistance is again restored to an equilibrium, and when the motion of the sea slackens the cable, the engines wind up the slack, thus the cable is constantly kept taut, and prevents that breakage which is the result of too sudden strains.

Many tows have been lost through the parting of the hawsers at critical moments, and their abandonment was a necessity in consequence of the impossibility, in a rough sea, to connect another line.

The two successful trips of the *Saturn* were the towing of the steamship *Akaba* from Turks Island to New York, and the steamship *Federation* from the Bahamas to Philadelphia. The *Federation* is a 2472 ton steamship and the voyage of 1200 miles to Philadelphia was made through what the captain describes as cyclone seas. The *Akaba*, a British steamship of 3700 tons, made the trip in the teeth of the heaviest gale, the captain says, he ever experienced. During the severest weather the tow made five knots an hour, and the voyage was successfully completed the 28th of February last in six days.

Power for Subsidiary Operations

One of the striking features in recent rolling mill design is the growing use of electricity as a power for subsidiary operations. In a recent visit to the works of the Wellman Iron and Steel Company at Thurlow, Pa., says the *Iron Age*, we noticed that a billet-shipping apparatus was run by a motor, the billets being elevated and distributed automatically along the shipping platform. At the same works an electric crane for loading plates is soon to be built, an interesting feature of which will be that the plates will be picked up by a large electromagnet. The screw gear for the famous large Wellman three-high 34-inch plate mill is operated by a motor, and the ingots are taken out of the heating furnaces and transferred to the roll table by a car, all of whose movements are controlled by motors. We understand that Mr. Wellman is now designing a charging machine which will go even farther in this direction. The Pittsburgh Engineering Company is building for the Carbon Iron Company of Pittsburgh a large new plate mill, in which the latest features in the application of electricity for rolling mill work will be adopted by John F. Wilcox, who is making the designs. We understand that, among other things, the shear will be run by an electric motor. Electrical engineers are apt to misinterpret the requirements of rolling mill managers. Thus, accustomed to scan closely economy in line wires and insulation for light and traction installments, they fail to appreciate that a rolling mill manager is willing to pay for the very best for short distances, however extravagant it might be for town work. It is becoming quite evident that, besides the electric light plant, our modern rolling mills will have an electric power plant as a part of their equipment.

USES OF MANNESMANN TUBES.—A paper was recently read before the Polytechnic Society of Berlin on "Developments in the Manufacture of Mannesmann Tubes," by Herr Krause. In the paper the military applications of the tubes were described, such as steel projectiles, ordnance tubes, rifle-barrels, steel lances, etc. Reference was also made to the manufacture of carriage poles, telegraph poles and water conduits by this process, and specimens were exhibited showing the bending resistance of the tubes. The demand for tubes to be used in the manufacture of bicycles is already overtaxing the productive capacity of the Berlin branch of the works, says a correspondent of *Industries*. One of the most interesting departments of the Mannesmann establishment is that of the telegraph poles, which is at present very active. The Postal Government for East Africa has ordered large quantities of these poles. Orders for about 7000 telegraph poles have been recently received for use on the small Asiatic railways, while large supplies are now being sent to Holland. Messrs. Heckmann have introduced the Mannesmann process in connection with the manufacture of brass and copper tubes with good results.

SCIENTIFIC PROGRESS.

An Interesting Electrolytic Phenomenon.

In a communication recently made to the Académie Royale de Belgique, Prof. Lagrange and M. Paul Hoho describe some experiments made by them on a luminous and calorific phenomenon which takes place under certain conditions when a current is passed through an electrolyte. The phenomenon was first observed in 1844 by Foucault and Fizeau, and has subsequently also been investigated by Righi, Colley, Plante and others. Prof. Lagrange and M. Hoho employed in one experiment a 10 per cent solution of H_2SO_4 , the positive electrode being of copper with 180 square cms. in the liquid, the negative electrode being a copper wire $\frac{1}{4}$ mm. in diameter plunged in the electrolyte to a depth of $\frac{1}{2}$ mm. Current was obtained from a battery of accumulators. At first, only the ordinary phenomenon of electrolysis are observed; then, as the volts are increased, bubbling and boiling occur at the negative electrode; next, intermittent arcs take place between wire and liquid, finally a luminous cylinder is formed having the copper wire for axis, the current then becomes steady and the resistance very high. On plunging the wire farther into the liquid, this series of phenomena can be reproduced. Much the same effects were produced with platinum, zinc, tin, iron, steel and carbon electrodes of different diameters, with sulphuric acid solutions of different strengths, and with a chloride of sodium solution. The production of the luminosity is accompanied by an abnormal resistance which is localized round the negative electrode; with electrodes 29 cms. apart, practically all the fall of potential takes place within 5 mm. of the negative electrode. The shape of the negative electrodes appears to have but little influence. Luminous effects can be made to occur also at the positive, but with some difficulty. It is, however, impossible to produce luminosity at both poles at the same time.

FATIGUE OF METALS.—The question as to the fatigue of metals under long continued stress has been tested, and, it is believed, satisfactorily settled, in the treatment of two similar suspension bridge links and the results obtained. A square iron link 12 inches wide, 1 inch thick and about 12 feet long, was taken from a bridge at Kieff, Russia, then about 40 years old, and tested against a similar link which had lain unused in store ever since the building of the bridge. Under these circumstances, the means of comparison were considered in the highest degree favorable, and the result necessarily of a reliable character in determining whether or not iron actually loses, and to what extent, any of its strength in prolonged service. The effect of the test showed for the old used link an ultimate tensile strength of 21.8 tons per square inch, an elastic limit of 11.1 tons per square inch, an elongation of 14.5 per cent, and a contraction of 17.33 per cent at the point of fracture. In the case of unused link, the tensile strength was found to be 22.3 tons per square inch, with an elastic limit of 11.9 tons, and an elongation and contraction at fracture of 18.42 per cent, and 18.75 per cent, respectively. From this it appears, therefore, that the two pieces of iron were of practically identical strength, the small difference actually observed being well within the ordinary range of variability of similar pieces of such metal.—New York Sun.

THE MAGNETIC PROPERTIES OF OXYGEN.—Commenting on Prof. Dewar's recent experimental verification of the magnetic properties possessed by liquid oxygen, M. Guillaume points out in *L'Industrie Electrique* that if we accept the values found by Edmond Becquerel for the magnetic constant of oxygen, it ought, when in the liquid state, and in a field of medium strength, to possess a magnetic moment per cubic centimeter, one-third of that of iron, and a magnetic moment per gramme twice as great as that of iron; so that the strange conclusion is forced upon us that oxygen is the most magnetic of substances.

ANOTHER SUBSTITUTE FOR IVORY.—The unsuccessful attempts heretofore made to prepare an artificial ivory have more recently been followed by an effort to produce a substitute for the natural article, in which quicklime plays the most important part. In this process, says *World's Progress*, the quicklime is first treated with sufficient water to convert it into the hydrate, but previously to its becoming completely hydrated or slaked an aqueous solution of phosphoric acid is poured upon it, and, while stirring the mixture, calcium carbonate,

magnesia and alumina are incorporated in small quantities at a time, and, lastly, gelatine and albumen dissolved in water are added, the result aimed at being to obtain a composition sufficiently plastic and as intimately mixed as possible. It is then set aside to allow the phosphoric acid to complete its action upon the chalk, and the following day the mixture, while still plastic, is pressed into the desired form in molds, and dried in a current of air at a temperature of about 150° C. In three or four weeks the product becomes perfectly hard. The proportions for the mixture are 160 parts of quicklime, 300 parts of water, 75 parts phosphoric acid solution, 16 parts calcium carbonate, 1 to 2 parts magnesia, 5 parts alumina, precipitated, and 15 parts gelatine.

SPENT ACID FROM GALVANIZING WORKS. Messrs. Davies Bros. & Co., of Wolverhampton, England, the waste acid from whose works amounts to 10,000 gallons a day, have disposed of this all to a syndicate who will treat it by the Ramage process. This process, the invention of Mr. A. S. Ramage, a chemist of repute, is simple and comparatively inexpensive. The liquor or "pickle" is first run into precipitation tanks to allow of the deposit of all refuse; then it is passed into another tank where milk of lime, finely strained, is added in such proportions as to entirely neutralize all the acid and precipitate the iron in solution. During the process of precipitation, compressed air is blown through the hydrate of iron, by which process the oxygen is so far absorbed that the compound becomes ferrousferic hydrate. The subsequent processes include filtering through pressure-pumps, washing, drying and grinding to a fine powder, when the constituent becomes a marketable commodity as a coloring matter for paint, having a commercial value of £10 per ton. This, omitting some minor details, is the outline of a project for the solution of what has long been regarded as an insuperable difficulty, and it appears to us as having in it the elements of immediate success, if not of ultimate perfection. What its ultimate results to the whole district will be may be partially estimated from the fact that to the individual firm in question, the material hitherto regarded as "waste" will yield a gross revenue of something like £4000 a year, to say nothing of the saving in constant and costly litigation.

"THE WORLD IS STILL YOUNG AND SCIENCE IS NEVER OLD."—At the recent annual dinner of the Royal School of Mines in London, Sir Lyon Playfair, in his response to a toast, said: "We know by experience much more than we know by science in regard to the occurrence of metaliferous veins. To this day, unless my science has not kept pace with my age, we cannot satisfactorily explain the manner in which metals have been deposited in their lodes; how their ores were originally formed; why a lode is rich in some places and dead in others; why they exist in continuous veins or are scattered in separate pockets. If we understood the scientific causes of mining phenomena, their application to practical ends would soon become of importance and repay a hundredfold all costs of research. A single new scientific fact, in correlation with other known facts, often throws a flood of light upon our ignorance. I had the pleasure of seeing, a few months ago, in America, that remarkable meteoric mass of iron which had real diamonds interspersed with it. This gave support to the Glasgow experiments of producing diamonds in molten metal, and may ultimately lead the way to their artificial production. But whether it does or not, is of far less importance than the acquisition of knowledge as to the conditions under which bodies are produced in nature."

A NEW INSULATING MATERIAL.—A new material possessing improved insulating properties is composed of sulphur, 7 lbs.; pipe clay, $\frac{1}{2}$ lbs.; slate dust, $\frac{1}{2}$ lbs.; paraffin wax, 2 oz.; and a variable quantity of oxide. The quantity of oxide added depends chiefly upon the color which it is desired to give to the mixture. It may vary from one-half to one-fourth of the total weight of the other ingredients. In working up the mixture, the clay and slate dust are first thoroughly mixed together by grinding, the materials being heated. Paraffin wax is then added, and the mixture is incorporated into a paste. After exposure for a time, during which it becomes dry and hard, the compound is ground to a powder and then mixed with the proper quantities of sulphur and metallic oxide.—Iron.

CLOUDS continue to form around storms in a continuous sheet, thickest near the center of the storm, and thinnest and highest at the outer limits.

ELECTRICITY.

Transmission of Power.

One of the most profitable sessions of the National Electric Light Association was that devoted to the discussion of the electrical transmission of power. It was aptly initiated by Mr. Carl Hering's paper on the general problem as illustrated by the Lauffen-Frankfort plant, which has made such a sensation the past summer. There seems just now to be a wide diversity of opinion as to the methods that should be pursued in this long-distance work that is likely to become so prominent a factor of electrical engineering in the very near future. Continuous currents, the synchronous alternating system, the two and three-phase rotary field systems, all have enthusiastic advocates equipped with divers reasons for the superiority of their respective pet methods. The fine results obtained by the three-phase transmission from Lauffen to Frankfort have just at present raised that apparatus to the rank of a first-class electrical fad, and not without reason, for so excellent were the results obtained on the whole, as to lead to general confidence in the apparatus by which they were obtained. Nevertheless, in the transmission of power to long distances, we have very much to learn. The *Electrical World* has this to say in this connection:

High tension continuous current apparatus, several units running in series, has been tried only in a single isolated case, and with a moderate amount of success. The synchronous alternating method has been tried with excellent results in a single American plant, but over a short distance and under circumstances especially favorable to the case. The two-phase rotary field has not been tried upon a large scale at all, and the three-phase system only, as before mentioned, at Frankfort, and in connection with this, it may justly be remarked that the false currents due to static capacity of the line show in some of the Lauffen experiments to a rather discouraging amount. What we most need now in the way of practical information is a series of experiments on these various proposed methods, such as can be tried, however, in the shops of any large company. Concerning the direct current proposals, we wish to know the total efficiency, and the difficulties, perhaps serious, that may be met in the care of high-tension commutators carrying comparatively large currents. From all the alternating systems we desire to know the actual efficiency of transmission, and the nature and magnitude of the difficulties produced by static capacity of the line. In case, as Prof. Elhu Thomson very pertinently suggested, the conductors are put underground in iron pipes and insulated with oil, this capacity must be very considerable, and even with overhead lines the experience of Lauffen has shown this result. To be sure, the effect of capacity will be partly annulled by the self-induction of the apparatus, but to what extent is this practicable, and in any case is the capacity of the plant for useful output likely to be seriously cut down by the capacity of the line? Regarding the synchronous system, it is very desirable to know whether a convenient, cheap and simple starting apparatus is available, and whether, in addition, motors such as those devised by Mr. Stanley, and described in his paper at the convention, will meet the requirements for power distribution after the current has reached its destination. Regarding the two and three-phase rotary field methods, the working efficiency of the motors must be accurately determined, and the question of running many motors in parallel—concerning which some doubts have been expressed—must be definitely settled. The practicability of very high tension alternate current dynamos feeding the line directly, instead of by step-up transformers, must be thoroughly gone into. Meanwhile plants of more or less importance will have to be built with such apparatus as can now be commanded. The electrical transmission of energy is just now beginning to develop, and it will not do to be too hasty in deciding off-hand in favor of one method over another. We have for guidance only a few isolated and uncertain experiments, and while the success of long-distance transmission of power should never for a moment be doubted, the particular methods which will lead to it are as yet by no means definitely settled. Steady and persistent experimental work is necessary, and meantime the problems that actually present themselves must in most cases be solved by methods which have been thoroughly tried, for a single unsuccessful commercial experiment would do an untold amount of damage in the progress of the art.

COAL AND ELECTRICITY.—In his address at the Convention of the National Electric Light Association, President Chas. R. Huntley pointed out that, after all, the cost of coal to operate an electric plant is only one among many items, and frequently a small percentage of the total cost at that. For instance, in electric railway work, the cost of coal comes to about 10 per cent of the total operating expenses, while in electric lighting it does not probably exceed from 15 to 20 per cent. In these days when municipal plants are the subject of frequent discussion, these facts are generally lost sight of, and the cost of electric lights is calculated by reference to the amount of coal burned under the boiler; thus ignoring the fact that firemen, engineers, linemen, trimmers, etc., are required; that carbons require daily renewal, and globes break; that, like all other machinery, engines, boilers, dynamos and lamps are subject to depreciation, require repairs, that the building must be insured, and that a sinking fund must be established for renewals. Cheap power in itself would therefore influence the cost of electric lighting very little, even if the electric current is distributed in the immediate vicinity where it is generated; while its distribution to any considerable distance in large power units on a commercial basis seems to be awaiting its demonstration here rather than in Europe. Hence a study of the facts pointed out is recommended, which ought to make any community falter before investing in a municipal plant simply because it may happen to have what is supposed to be a cheap source of power around the corner.

FORGING BY ELECTRICITY.—The outer part of a piece of iron, when heated in a forge, is at a white heat, while the inner part is comparatively cool, and it cools so rapidly that several heatings may be necessary before it can be forged. In forging by electricity, the slow, alternating currents heat the inner part first, and the heating is so rapid that only the part that is in the path of the current is heated to any extent, the ends being hardly warm. A workman can handle a bar of iron a foot in length that has six inches red hot. The heating apparatus has bronze clamps, with electrodes, that hold the piece to be heated. A bar of iron can be heated to a white heat in a few seconds. A steel wire can be twisted in a spiral at one heat. A square bar of iron can be heated evenly throughout its length, worked into different shapes on an anvil and straightened again at one heat. In welding by electricity, the two pieces are brought end to end, and, the imperfect contact causing resistance, the ends become heated and are then pressed together.

THE DEVELOPMENT OF ELECTRIC TANNING.—According to *La Lumiere Electrique* several French tanners have adopted the electric tanning process, but have not made the fact public "for fear of displeasing a clientele always distrustful of new methods." The Societe Brion et Dupre is known to employ six drums, capable of an annual output of 600 tons of tanned hide. In Portugal there are two electric tanneries at work, at Porte and Braga, having an annual output of 700 tons of tanned hide; and in Madagascar an electric plant is being set up. In Brazil, at Boa Vista, some eight miles from Rio de Janeiro, there is an electric tannery covering about 13 acres, and possessing no less than 100 drums. The annual output of the Boa Vista plant will ultimately be about 70,000 tons.

ELECTRIC WELDING OF IRON WHEELS. Electric welding is now applied to the work of manufacturing iron wheels. The process of welding the nave, spokes and tire of a wheel is accomplished in 30 seconds. First, the tire is laid on the machine, then half of the nave which contains notches in which the spokes fit. The latter are laid in the nave, and inserted in the tire, and then the other half of the nave is laid on the top of the lower half. These are held together by hydraulic pressure. The electric current is turned on; the iron becomes heated to the proper degree and welds. The pressure is removed, and the now compact wheel is taken from its resting-place, rolled aside and allowed to cool. The work is done in very much less time than that taken by the old process.

NOT PROFITABLE TO THE COMPANIES.—Erasus Wiman, of New York, read a paper recently before the convention of the National Electrical Light Association at Buffalo, on "Electric Lighting from a financial standpoint." He stated that present prices for electric lighting were not profitable and urged the friends of the electrical industry to endeavor to impress that fact upon the public, declaring that if perfect service

is to be had better prices must be paid. Low prices have prevailed because the companies themselves have not heretofore appreciated and understood the cost of operation and the great loss due to accident and rapid depreciation.

GOOD HEALTH.

The Movement Cure.

Medical Inspector F. S. Clark, U. S. cruiser Baltimore, in a report to the Chief of the Bureau of Medicine and Surgery, U. S. Navy, speaks as follows of the Swedish gymnasiums: Sweden, where originated the "Movement Cure," has the most general and perfect system of gymnasiums. It is taught in the public and military schools. Officers of the army and navy are teachers. A captain in the navy has charge of the system in Stockholm. People continue to take exercise in these gymnastics until fifty or sixty years of age, for preservation of their health. Special gymnasiums are constructed for treatment of sick. In these, passive motion is first given by attendants with the use of the mechanical appliances. Later, patient begins to exercise himself with assistance. Dr. Zander's gymnastique is of special interest—the original and largest of its kind in the world. Its originality consists in applying passive motion by machinery run by steam. It occupies three large rooms, connecting, on the same floor. The ingenious machines are numerous and well calculated to bring into play almost every muscle and set of muscles. Students come to Stockholm from different countries to prepare themselves for teachers in their respective homes. Some of the diseases benefited are paralysis of all kinds, congestions of brain, kidney, liver, and pelvic viscera, dyspepsia, rheumatism, and those conditions due to sedentary habits. Even one case of phthisis pulmonalis claimed to be much better after six months' treatment by active and passive exercise of thoracic muscles.

FRUITS SHOULD BE WASHED.—The following curious instance is reported in a French journal by M. Schnirer of the ease with which tubercle bacilli may be disseminated. While at work one day in the laboratory of Weichselbaum, he sent for some grapes to refresh himself with. The fruit had been kept up for some time in a basket outside the laboratory, and was covered thickly with dust, so that the water in which it was washed was absolutely black. On examining the water, he reflected that, inasmuch as the neighboring street was traversed frequently by consumptive patients going to the clinic, the dust probably contained the desiccated sputa of these patients, charged with tubercle bacilli. To settle this point, M. Schnirer injected into three guinea pigs 10 cub. centim. of the water in which the grapes had been washed. One animal died in two days from peritonitis, the two others died on the 48th and 58th days, respectively, presenting marked tuberculous lesions, especially at the place of injection. The water in which the grapes had been washed was taken directly from the faucet, and the glass containing it had been sterilized. Neither the boy who had brought the grapes, nor the merchant who had sold them, was tuberculous. Hence the cause of infection was beyond doubt the dust on the grapes. This experiment illustrates the danger arising from the dissemination of desiccated tuberculous sputa in the air. The conclusion is obvious: Wash grapes before they are eaten.—*Jour. State Medical Society of Arkansas.*

CIGARETTE EYE.—Tobacco smoke has always been regarded by the faculty as more or less injurious to the eyes. Whether the belief is well founded or not, we are unable to say, says the *Ophthalmologist*, as symptoms attributed to one cause frequently owe their origin to an entirely different source. Ophthalmic pathology is not so far advanced, even now, that we can dogmatically assert that tobacco smoke is hurtful to the eye; the cornea we know has great power of resistance, and although the smoke may occasion catarritis, even this would not be permanent. However, in the case of cigarette smokers, there are other noxious factors at work than those contained in the tobacco. The paper must be taken into account. The chemicals employed in the manufacture may enter into the smoke and have a very deleterious effect. "Cigarette eye" is well known in New York. At the present time there is said to be quite an epidemic there. The symptoms are dimness and a film-like gathering over the eye, which appears and disappears at intervals. It is said to be very dangerous.

USEFUL INFORMATION.

SIGNALING BRAKES ON PIPE LINES.—Mr. W. H. Glore, superintendent of the Covington (Ky.) city water works, writes to the *Engineering News* concerning a novel signaling apparatus which is to be used there to give warning of leaks in the supply main or any accident along the line needing immediate attention. The water supply of Covington is pumped from the Ohio river to reservoirs from which it passes by gravity through some eight miles of pipe to the city. As there is but a single pipe line, it is especially necessary to keep close watch of and repair leaks as soon as possible. It is proposed to parallel the pipe line with a telegraph wire strung on poles. Connected with the wire will be signal boxes located in farm-houses and each having numbers. A card of instructions will be placed beside each box, with, for instance, the following code of signals: One ring, a landslide; two rings, a small leak; three rings, large leak; more than three rings, a serious break requiring immediate attention. The alarm will be sounded both in the city office of the works and at the pumping station, the number of the signal station being indicated as well as the character of the trouble. In case of a serious break, the men at the pumping station will at once proceed to the reservoir and shut off the supply from the main, after which, of course, men would proceed to the break to make repairs.

A METHOD OF NICKEL-PLATING.—The following process of nickel-plating trailing wheel parts and similar articles is said to have given excellent results, according to *Iron*. The bath is composed of 1000 g. of pure nickel sulphate, 750 g. of neutral tartaric acid ammonia, 5 g. of gallic acid (tannin) and 20 l. of water. The neutral tartaric acid ammonia is obtained by saturation of a solution of tartaric acid with ammonia. The nickel salt must be neutral. For this purpose the whole is dissolved in 3 to 4 l. of water, and allowed to boil for about a quarter of an hour. Then as much water is added as will produce altogether 20 l. of fluid, which is filtered. The precipitate obtained is very white, soft and uniform, and bears no traces of roughness on the surface. On crude or polished castings very heavy deposits can be obtained, and at a price which scarcely exceeds that of copper plating. Galvanoplastic impressions may also be obtained in this bath. The current need only be weak.

RUSTY GRINDSTONES.—Some one has asked the *Blacksmith and Wheelwright* for information in regard to his grindstones which became rusty and refused to cut hard steel. Mr. W. L. Hardy gives a remedy as follows: "I have a small stone that acts the same way, and my remedy is to turn it off slightly with a piece of soft iron; a piece of three-eighths inch rod answers very well, using plenty of water. I have a 'kink' for this. Instead of holding the rod at right angles to the axis of stone, I incline the free end in the direction I wish to move it, and roll it on the rest block; this feeds the rod in as fast as it is ground off, and prevents jabbing holes in the face of the stone. I have noticed that when an emery wheel used for grinding hard steel becomes dull, grinding a piece of cast iron on it will cause it to again cut hard steel freely."

GRANULATING ORE.—At the recent annual meeting of the American Institute of Mining Engineers, Mr. W. H. Hoffman of the Croton mines, Brewsters, N. Y., described the Sturtevant mill, the features of which are widely known. He reported that on well roasted Croton ore he can granulate to 12 mesh 24 gross tons per hour in a 20-inch mill, with an expenditure of 96 horse power. The cost for renewals compares as follows with the different appliances used at various times at the Croton mines: Common single-jaw Blake soft-steel cover rolls, 1½ cents; Blake multiple crusher, 3 cents; rolls with chilled cast iron covers, 4-12 cents; Buchanan rolls with soft-steel covers, 2 cents; Sturtevant mill ½ cent per ton of rock.

MAGNETIC CONCENTRATION.—During a discussion at the late meeting of the American Institute of Mining Engineers, E. C. Pechin, Dr. Raymond and John Birkinbine referred particularly to titaniferous deposits, their magnitude and persistency geologically. President Birkinbine reported that efforts were being made to remove the ilmenite in titaniferous magnetites by magnetic concentration. In one instance fair success has been attained, about 70 per cent of the titanium being eliminated, while the amount of iron carried off in the tailings was relatively small.—*Iron Age.*

Gold and Silver Mining.

The silver mining rushes in Colorado should not entice any miners away from this State. Silver mining camps grow slowly. It takes several years to open and equip the mines, even after they pass from the ownership of the prospector and discover into that of corporations. After the first great excitement in a silver camp things are generally slow for a long period. In gold mining rushes, it is different, for in such cases the claims are apt to begin paying at once, and poor miners have as good a chance as anybody. Moreover, there is a good deal of advertising of Colorado in these new camps. Very high assays of ore are telegraphed all over the country, but they may be from specimens only. None of these mines are yet opened enough to give much employment to miners.

California's gold is greatly in demand in these days and will become more so. Silver mining is not as profitable as formerly, owing to the great discount on the metal. Should Congress finally give a good appropriation for debris dams in this State, and hydraulic mining be resumed, then California mining interests will revive and miners be better off here than in any mining State of the Union. And it looks as if this were going to be the case.

The Miners and Congress.

The success of the Miners' Committee at Washington in drawing such attention to the condition of the hydraulic mining in California, as to obtain a report from the Committee of Mines and Mining favoring an appropriation of \$450,000 for debris dams, is highly encouraging. It was feared a favorable report would be difficult to obtain from this Committee. Of course, the report is still to be dealt with in the House itself, and the amount may be cut down. But having been presented with the unanimous endorsement of the Committee, the bill has good chances to pass. Even if the amount is reduced, a start will be made in the right direction, and somewhat sooner than many expected.

The fact that such favorable consideration has been given to the pleas of the miners, before the committees, shows that an interest has been aroused on the question which did not previously exist. Only one side of this question has before been argued, and the representations heretofore made to Congress relating to this subject have been factional in their nature only.

During this session the miners' side of the case has been presented fairly and dispassionately. Their former opponents having agreed to assist the miners in certain specific demands, made upon a stated basis, the controversial features were absent. Therefore, it has been possible to obtain some encouragement. As long as two factions were opposing each other, nothing could be accomplished.

It was a wise move, too, for the Miners' Convention to send on a special committee in their interest. These gentlemen have not only been able to explain affairs properly to Congressmen and Committees, but they have enlisted the aid of the coast delegation. The Senators and Congressmen from California have given every possible aid. Senator Felton and Congressman McKenna and Caminetti in particular, have given valuable assistance. Mr. Geary had a bill of his own, local in its nature to some extent, which he did not care to see displaced, but his work has been in the same direction as the others after all.

Efforts will now be made to get an early hearing for the bill, while the facts presented are fresh in everybody's mind. It is important that work on the proposed dams commence at as early a date as possible. Preparations for mining would commence shortly should the bill pass. Messrs. Searles, Luttrell, Hobson and McMurray, the Miners' Committee, have worked hard to present their case properly, and have certainly succeeded very well as far as they have gone, and they deserve the hearty thanks of the California miners. They have still much to do, however, and must be kept at their post until ultimate success is reached. The Miners' Associations throughout the State must lend as much financial assistance as possible to the State Association, in order that this important delegation or committee may be kept at work.

Another thing, too, miners should remember: The bill has not passed yet, and this would be the very worst of times to start up any hydraulic mining. These mines should all be absolutely closed, as agreed to, until proper provisions are made which will again let them work without any danger of the injury formerly complained of.

THE COEUR D'ALENE MINES.—The Mine Owners' Association of Coeur d'Alene, at a meeting held Friday night in Wallace, Idaho, decided to resume work throughout that silver and lead section. The railroads have restored the old rates on ore shipments to the East, being a reduction of \$2 per ton. Work will be resumed about April 1st if a sufficient number of miners can be had. When the mines closed down, 2000 miners left the country. Heretofore, wages

have been \$3.50 per day alike to miners and carmen, but in the future the mine owners declare that they will pay this rate to miners only and \$3 to carmen.

Gold Mining Results.

People often wonder why it is that so little is heard of the details of results in California gold mining. We learn of the aggregate yield of the year, but as to profit or loss, very little is published.

The reason for this is simple. Most of the gold mines are the property of individuals or private companies who conduct them as legitimate business enterprises, and not for stock-jobbing purposes. When mining companies go to the public with stock to sell, then the public has a right to know all about their affairs. But if it is carried on by private owners, they do as they like about making results known.

Very few indeed, of the gold mines of this State have stock for sale unless, perhaps, at the inception of work. But the stock is not promiscuously dealt in by the general public. In the Stock Exchange of this city very few California mines are even listed or called. Stock dealing here is mainly confined to silver mines. The gold mines of the State are not much affected one way or the other by the variations of the market here.

The owners of the gold mines are therefore justified in keeping the condition of their mines to themselves if they see fit. There is no occasion to misrepresent affairs, or to herald abroad strikes or finds of rich ore. The better the mines pay, the less said about them by the owners, as a general thing. We hear more about prospects and newly developed claims than the old ones which are paying. California is less advertised as a mining country than it might be were these conditions not prevalent, for with no stock to sell, there is no occasion to "whoop up" the mines.

Restraining Dams.

The news that a favorable report had been made and an appropriation of \$450,000 recommended for debris dams, was received with rejoicing in the mountain counties. At Nevada City, a committee of Hydraulic Parlor, Native Sons of the Golden West, fired a national salute in honor of the event.

If Congress will now accept the recommendation of the Committee on Mines and Mining, and pass the bill, there will be a "boom" in the mining sections of this State within the next few months such as has not been experienced for years. There will then be reason to expect a return of former prosperity in the gravel-mining regions of California, which will be felt all over the State.

The time is ripe for this action. Gold is scarce and in demand. Our mines have plenty of it, if we are only permitted to get it out. With the recommendations of the Government engineers carried out, the mines can be worked without injury to any other interests. It has not taken us very long to prove this to the Congressional Committees. A simple presentation of the facts, properly established, has brought about a change of sentiment. It only remains now for the main body of Congress to adopt the committee's report. Then, in a few months, the claims can be got ready. The dams need not be entirely completed for the mines to begin. In fact, the engineers suggest only raising them about ten feet a year, so that it need not be very long before active operations can be commenced.

THE EUREKA mine near Hornitos, Mariposa Co., has been bonded to T. D. Callahan, and the Brooks mine has been bonded to J. E. Spencer. Both these mines will be worked at once. They have been closed down some time.

California Minerals and the Fair.

The California World's Fair Commission has decided to set aside the sum of \$15,000 for the Department of Mines and Mining. It was unfortunate that Robert McMurray, one of the Commissioners, was absent in Washington, helping the miners' cause there, or it is probable he could have prevailed upon the committee to increase this amount. However, agriculture gets only \$17,000, and horticulture \$20,000; machinery and manufactures get only \$500 each, so that mining fares passably well. Mr. McMurray had hoped to get \$40,000 for mining out of the \$300,000 appropriated by the State.

This settles one thing apparently. It will not be possible to attempt to make any new collections of minerals, etc. It will take pretty much all of the amount stated to send on the collection of the State Mining Bureau, display it and provide for its care. Little beyond this can be done. Men will have to be placed in charge of the display, and they must be paid out of this amount. Freight and other expenses will have to be paid.

THE MINING AND SCIENTIFIC PRESS suggested months ago that the State Mining Bureau collection be sent to Chicago. It belongs to the State anyhow, and we can readily spare it from the city during the Chicago fair.

The minerals are all identified, classified and labeled, and are in much better shape than any other lot could be without great labor and expense. The cases of the Bureau are well filled, and the collection is much larger than that possessed by any other State. It will help out the California mineral display greatly. It is understood that this collection will be sent under the care of the State Mineralogist or some of his assistants.

THE ASTRONOMICAL SOCIETY OF THE PACIFIC holds its annual meeting at the Hall of the Academy of Sciences on Saturday, March 26th. The annual election of a Board of 11 Directors and a Committee on Publication will be held from 8:15 to 9 P. M. The following papers will be presented: 1. Annual address by the retiring President, Hon. Wm. M. Pierson, F. R. A. S., San Francisco. 2. The Sun's Motion in Space, by W. H. S. Monck, F. R. A. S., Dublin. 3. How to find Celestial Objects with an Equatorial Telescope without the Aid of a Sidereal Timepiece, by Chas. Burckhalter, F. R. A. S., Oakland. 4. Astronomical Observations in 1891, by Torvald Kohl, Odder, Denmark. 5. The Harvard College Observatory Astronomical Expedition to Peru, by Mrs. M. Fleming of Cambridge. 6. Discovery of New Rills on the Moon on Lick Observatory Negatives, by Prof. L. Weinek of Prague.

COPPER has gone up about to 12 cents a pound of late, and the copper companies, by united action in restricting production, hope to give the metal still more of a lift. As before stated in the PRESS, the larger producers have come to an agreement as to the amount each shall turn out. The Montana and Michigan companies are the largest producers, and the Arizona next. Not very long ago copper was only 10½ cents, but the price in New York is now 12 cents.

WORK on the Pacific Mail Co.'s new steamer, now building at the Union Iron Works, is progressing very favorably. Her dimensions are as follows: Length between perpendiculars, 326 feet; over all, 345 feet; beams, 45 feet; depth of hold, 27½ feet. She will be supplied with six steel boilers, each 12 feet in diameter and 11½ feet in length.

THE Placer County Miners' Association now has 616 members, thirteen of whom are ladies.

Coal-Sorting Machinery.

In describing the arrangements for handling the coal at the iron breaker at Drifton, in recent numbers of the PRESS, the methods of dumping the cars have been plainly shown. The plane upon which the coal is hoisted is a pin-connected structure as shown in the accompanying plate, the posts, struts and tie rods being of the same general character as those employed in the lump chute and the rest of the building. Each track is carried on two riveted girders 18 inches high, which are connected together 27½ feet apart by division plates and tie rods. Over

S and S; 12, fifteen-inch I-beam carrying timbers under wet-screen; 13, eight-foot sheaves at dump for gunboat rope; 14, twenty-four-inch I-beam carrying east end of jig tanks; 15, I-beam carrying broken-coal screens S; 16, fifteen-inch I-beam; 17, twenty four-inch built up I-beam under deep end of pockets; 18, eight-foot sheaves nearest to hoisting engines, north side; 19, line shaft from Westinghouse engine for driving jigs; 20, line shaft for driving drags taking coal from jigs; 21, pulley from which gyrating separator K, is driven; 22, bevel wheel shaft for driving supplementary coal drag M; 23, beams for gunboat and plane;

The Caminetti Bill in Congress.

The Committee on Mines and Mining have agreed to report the recommendation of \$450,000 for the Osminetti Mining Debris bill, for the relief of the hydraulic miners of California. The only point upon which there was any trouble was the amount of the appropriation. Stevenson of Michigan, who is also a member of the River and Harbor Committee, and had not attended any of the former meetings to consider the mining bill, showed up to day and moved to fix the sum allowed at \$200,000. Mr. Caminetti had been authorized by several absent members to cast their votes in favor of \$450,000, but the

secure a day from the Committee on Rules for its consideration. As to the ultimate chances of the bill in the House, it is hard to speak with certainty. There is no visible opposition now—that is to say, everybody seems willing, as an abstract proposition, to give the miner a show, but the bill is very long and complicated, and when it comes to be considered in detail, there is danger of trouble over particular features. Mr. Caminetti is confident that the only point about which there is any uncertainty is the appropriation. The bill, he thinks, is sure to pass. As to the appropriation, he hopes to be able to convince the House that the miners are asking nothing unreasonable. "I take my stand," he says, "upon the

SIDE ELEVATION OF BREAKER FOR HANDLING AND SIZING COAL.

the tops of these, wooden sills are laid, which are also shown in the drawing. Each gun-boat track is immediately over a pair of girders. The main structure, or that part of the breaker which contains the machinery, is built immediately over the pockets.

The side elevation of the breaker is shown in the plate. The numbered parts are as follows: 2, built-up I-beam carrying dump; 3, large girder at top of mud-screen pocket; 4, taper built-up girder, forming sides of mud-screen pocket H, and carrying dump chute and bars; 5, built-up I-beam carrying platform E; 6, check horn on end of mine-car rail on dump C; 7, inside girder carrying sheaves (18); 8, outside girder carrying sheaves (18); 9, fifteen-inch I-beam carrying mud-screen S; 10, latch on tail-gate of mine-car; 11, twenty-four-inch I-beam carrying driving mechanism of jigs, also screens

24, slate chute under jigs; 27, five-foot sheave or dump for barney rope. Pare the lump coal chutes for various sizes, and Q are the loading chutes.

W. H. STORMS, representing the MINING AND SCIENTIFIC PRESS, is in town. The PRESS is under the very able editorial management of Cbas. G. Yale, a gentleman widely known in newspaper and mining circles, and is vastly improved. It is a journal all Pacific Coast mining men should read.—Grass Valley Tidings.

SILVER PURCHASES.—The offers of silver to the Treasury Department aggregated 921,000 ounces. The amount purchased was 605,000 ounces at .8987 to .8984. The price per ounce paid by the Government on Monday for silver is the lowest figure at which the Government has ever purchased the metal,

chairman ruled that no proxies could go.

The committee adopted the \$200,000 proposition. Mr. Caminetti moved a reconsideration, and the absent members dropping in subsequently, the \$450,000 appropriation was carried.

One member objected to the provision forbidding the employment of Chinese labor on the works. Acting under instructions from the miners' delegation, the committee waived that point. A country editor of the committee protested on behalf of his guild against the section requiring notices to be advertised in the city papers. He was pacified by adding "a paper in the county containing the mine to be opened."

The provision levying a 3 per cent tax on the miners was added, and with these amendments and some slight verbal changes the bill was unanimously agreed to, and Mr. Caminetti was instructed to prepare the report.

He is now engaged on this work, but does not expect to bring the bill into the House until after the River and Harbor bill is reported. After that he hopes to be able to

conclusions of the Government engineers. There are the accumulations of 40 years of mining, as well as the result of natural erosion, which will have to be taken care of sooner or later. If they are not retained in the mountains, they will have to be dredged out of the river channels in the valleys. The Government will save money by doing the work at the right end, and by means of the 3 per cent tax it will be able to pay itself back at the expense of the miners. The miners are not asking charity—they are proposing to give it."

THE Jenckes Machine Co., Sherbrooke, P. Q., Canada, have been appointed the sole Canadian representatives of the American Diamond Rock Boring Co., 15 Cortlandt St., New York, manufacturers of the celebrated Diamond Rock Drills for Tunneling, Mining and other rock-boring purposes. The arrangement provides for the manufacture of these machines at Sherbrooke, and the Jenckes Machine Co. will thus be in a position to supply the demand for them promptly throughout the whole Dominion.

The Game Birds of Lassen County.

We find in the *Weekly Mail* of Susanville, Lassen county, a very interesting popular article on the game birds of that portion of California, and as the same species are visitants or residents also in other parts of the State, the account will be generally interesting.

While the natural histories placed in the hands of our young people give much information concerning the game birds of all countries, there is no list showing the child what birds are found here. In this article we have called attention to the principal game birds of this county, giving at the same time some data about their size, color, habits, number of young reared, etc.

These facts should be placed in the hands of every child in the county who is old enough to read well, and each schoolroom ought to contain this matter in some conspicuous form for the use of both teacher and pupils.

One of the finest game birds of Lassen is the dusky grouse which lives in the mountains, while the sage hen, another grouse, inhabits the valleys. The dusky grouse, during the summer, feeds upon berries, seeds and grain, but in the winter, when the mountains are covered with snow, it lives upon the buds of the fir trees. This grouse is about 20 inches long, is dark brown above and lead color beneath. These birds frequent the roughest and most difficult ground, and are not easy to find. Their flesh is dark colored, but is sweet and delicious.

The sage hen is another of the grouse family, and is one of the largest and finest. They have a varied plumage of black, brown, gray and white, their tails are long and pointed and contain 20 feathers. The male bird weighs five or six pounds, but the female is fully a third smaller. They do not fly readily when disturbed, but squat down or attempt to hide, apparently thinking they will not be seen. They fly with a loud whirr like the rest of the grouse family, but their flight is slow and laborious compared with the dusky grouse. They live in the dry, treeless and waterless plains of the Great Basin, but here are found both in the open valleys and in the timbered hills. The male bird has large, flame-colored patches on the sides of its neck that are greatly distended during the mating season, but these are hidden by his feathers at other periods. They build their nests on the ground, beneath low bushes or high tufts of grass, and the mother bird lays from 13 to 17 eggs. These require from 21 to 22 days to hatch.

Owing to their food being very largely the leaves of the bitter sage brush, the flesh of the old birds, especially in winter, tastes very strong; but the young bird, in the fall of the year, is delicious. Hunters assert that by emptying the stomach and crop of the bird as soon as killed, the strong taste of the flesh is avoided. One curious fact about this grouse is that it has no gizzard like other birds.

THE QUAIL.

A third favorite game bird is the quail, and this is found in nearly every part of Lassen, from the open valleys to the highest mountains. These birds associate in flocks of from 15 to 20, and live upon seeds, berries and insects. Of the latter, they destroy immense numbers. They do not perch upon trees like other quail, but roost upon the ground. The upper parts of the birds are olive brown, the breast and neck lead colored and the abdomen white. They have two long, straight feathers rising from the back of the head like a plume.

Their nests are formed upon the ground, and from 10 to 15 eggs are usually laid, but some nests have been found with 20.

A quail, when shut up and the eggs taken away each day, has been known to lay in one season over 70 eggs. These eggs are speckled, like the eggs of a turkey. One of the most curious facts about the roosting of the mountain quail is its habit of watching against danger. The birds will all form in a circle, standing some distance apart, then they will back up till their tails touch each other and then they drop upon the ground, knowing that nothing can approach them without being seen or heard by some of the flock.

When the flock has been scattered, owing to an alarm, the birds call their mates with a clear, shrill whistle, much like a man whistling to his dog, and hunters take advantage of this to call these birds, for the purpose of killing them.

Each spring and fall there are many swans, for a short time, in the various valleys and lakes of the country. These birds stop for a few days to rest and feed, on their annual migrations north to Idaho, parts of Washington, and to British Columbia, where they breed and rear their young. Of the swans, there are but two varieties that visit our county—the American and the trumpeter. The flesh of the young birds, called Cygnets, is palatable; but that of the old swans is tough and stringy. The American species is five feet long from the point of its bill to the tip of its tail, and six feet across its extended wings. Its plumage is snow white, but the feet and bill are black.

The trumpeter swan receives its name from a harsh, loud cry that it gives, and this is a larger bird than the American, measuring nearly five inches longer.

THE GESE.

These birds pass through our county twice a year, both in going to their northern breeding grounds and south to their winter pastures. All varieties are noted for their sharp ears, sharp eyes and keen smell. They migrate in flocks of from 10 to 100. They always, like the swans and ducks, fly in the form of a triangle, with the strong and tough old ganders in the lead. Geese can readily detect noises that indicate danger. We have counted 29 flocks of geese in the air, at one time, moving toward the north. The largest and finest for table use is what is known as the "honkers," or Oregon geese. These on the Atlantic Coast are known as Canada geese. They are 40 inches long, and a very large and fat one will weigh 16 pounds, or as much as a big turkey. The honkers usually fly by themselves, but the other geese may be seen in the same flock. The head, neck, feet and bill are black.

The brants are only about half the size of honkers; they are a dark-grayish goose, with black legs and feet.

The speckled breasts are next to the honkers in size, and are the next best for the table. They have pale or yellowish legs and feet.

The snow geese is a fourth species that is often seen. They have reddish-yellow legs and feet. While their plumage is snowy white and they are very attractive looking birds, they are the poorest game bird among the ducks and geese that frequent our lakes.

In the Sacramento valley, all these geese make their homes in the vast tule swamps, but fly to the grain fields each day, and have to be frightened away by men who shoot at them to keep them from eating up the grain. In our mountain valleys, occasionally, a goose will make her nest and rear her young, but this is seldom the case, and when it occurs, hunters think that the bird is a wounded one that is unable to keep up with its fellows in their northern migrations. In returning from the north, the geese make short halts, while the ducks remain in Modoc, Plumas and Lassen until about the second snowstorm, when they take wing for the Sacramento and San Joaquin valleys.

DUCKS.

There are found in California some 22 species of ducks, and of these, eight or ten visit the lakes, streams and ponds of Lassen each year. In size, beauty, and graceful attitude when swimming, the mallard duck stands at the head of the list. He is not so fine a table bird as the canvasback, but these are seldom seen here. The mallard is 24 inches long and weighs from four to four and a half pounds. The drake is handsomely marked with green, chestnut and white. The female is brown and destitute of the bright colors of the drake. The female makes her nest upon the ground amid rushes or weeds, or sometimes in a hollow log. The eggs vary from eight to fourteen in number and the ducklings are very active and alert from the moment they are hatched. The nests are often found fully half a mile from a stream or lake, yet the day the little ducks are hatched the old bird manages to escort all to the water, upon which they launch themselves with fearlessness. While the female is sitting the male bird remains near by, as if to watch for danger. The mallards are shy and cautious, and they fly in a circle several times around the spot where they intend to alight. If there is the slightest thing that looks suspicious, they will seek another spot. They have sentinels posted while feeding, and by old hunters it is said some of the flock are awake at all times during sleeping hours. They feed mostly at night and seek the waters of the creeks and streams during the day. A peculiarity of this duck is that the drake sits on the eggs during the absence of the duck while she is feeding.

A few mallards rear their young in our valleys, but the greater number go much farther north. They pass through our county in March and April going north and return in October or November.

The canvasback is 20 inches long and weighs about three pounds. It feeds upon wild celery and dives to get its food. It is a strong and rapid flyer, and we have seen this bird in the Sacramento valley rise some distance behind a railroad train in motion, follow and overtake the train and then pass ahead of it very rapidly. It is one of the most expert divers known, and remaining under water longer than a mud hen, our boys will understand that few birds can beat it diving. It goes as far as Alaska to breed during the summer.

The redhead is often sold for the canvasback and few can tell any difference in the taste. The redhead has a blue bill and is a smaller duck than the canvasback.

The duck most frequently seen is known as the Widgeon or "bally." This duck has a white patch on its head and in many localities is known as the Baldpate. It is 18 or 19 inches long and weighs about two and a half pounds. The head and neck is a reddish yellow, the forehead of the body a brownish red, and the under parts are white. The tail is brown and contains 14 feathers, while its bill is blue and has a black tip. The natural histories assert that this bird is a day feeder, but old hunters say that it feeds both during the day and at night. It gives a clear whistle that may be heard some distance. They can neither dive as quickly nor fly as swiftly as the mallards or other ducks we have named. About one-fourth of the ducks that are killed here are Widgeons.

The Teal is not so large as the other ducks already named but it is a fine table bird. There are two species, the green winged and the blue winged Teal. They are 14 or 15 inches long and weigh one and a half pounds. It has a narrow bill as long as its head and pointed wings. The head and shoulders are chestnut colored with a green stripe on the neck, while the under parts of the bird are white. It is one of the first birds to return from their northern migrations. Johnson's Natural History, one of the newest and most complete ever published, says that the blue winged Teal is not found on this coast, but this is evidently taken from a very early report upon the birds of this coast, where such a statement is made. It is not a fact, for there are thousands of blue winged Teal ducks found all over California. It is a less shy and suspicious bird than the green winged duck and more easily shot. About 25 per cent of the ducks killed in Lassen are Teal ducks. The female duck lays from 11 to 17 eggs but as high as nineteen have been taken from a single nest.

The summer or wood duck is the most beautiful of the duck family found here. It receives its name of summer duck because the duck remains here during the summer, while it gets its name of wood duck from its habit of making its nest in trees or stumps. Dr. Brewer says that it is conspicuous for the swiftness, ease and elegance of its flight. It can pass through woods and among the branches of the trees with as much facility as the wild pigeon. Its splendid plumage shows a great variety of rich colors. Instead of congregating in flocks, like the Teals and Widgeons, the wood ducks are usually seen in little flocks of three or four; often they go in pairs and occasionally they are seen alone.

They live mostly upon acorns and will eat so greedily that they cannot swallow another one, yet will hold one in their mouths. They seek the deep pools along the creeks, where they are hidden by the dense bushes of the banks,

and are shy and difficult to approach. They build their nests in hollow trees or stumps, and when the young are hatched the mother bird carries the little ones down to the ground by holding them by the back or wing with her bill. Hunters assert that the ducklings will ride to the ground on the back of the mother. The old bird lays from 12 to 20 eggs in a nest and some nests have been found with as many as 23 eggs in them.

Another duck found here is the Spoonbill, which derives its name from its large, flat bill. This duck is 20 inches long and weighs nearly two pounds. The head and neck are green, the back brown and the tail black. This duck feeds largely upon worms, frogs, etc. It makes its nest on the ground, lays from 10 to 12 eggs and rears its young in the marshes of the far north. It is a shy, suspicious, intelligent bird, with great powers of flight. But few of them are killed by hunters.

The Gadwall or Grey duck is 19 inches long and weighs two and a half pounds. It is a quick diver and rapid flyer, feeds during the day as well as at night, and makes its home mostly amid pools shut in by rushes and high weeds.

The Springtail or Pintail is a wilder and more wary bird than the mallard and not easily approached. It rides the water as buoyantly as a cork and bounds from it very quickly. Its length is 30 inches, its weight three pounds. It has a long and narrow bill and a pointed tail, the feathers of which slightly curl. The head and neck is a dark brown, glossed with green and purple. The tip of the tail is coal black while the breast is pure white, the wings are bluish grey while the bill is black above and blue beneath.

The Butter duck is a small and very fat little duck, not half the size of the mallard, and is common along most of the small streams of this State. It feeds on grass and grain and is so quick a diver that it is almost impossible to kill it, unless the hunter shoots it upon the wing or watches till the bird just puts its head out of the water. Its body is dark with white underneath and the bill is blue.

OTHER BIRDS.

The robin is unfortunately considered by many a game bird and suffers accordingly. The top and sides of the head are nearly black, the under parts of the body a chestnut brown, and the wings a dark brown. The bill is yellow. These birds are migratory, like the ducks and geese, and go far south during the winter. They do not make their nests or hatch their eggs lower than an altitude of about 3000 feet. Their nests are built in trees, four or five eggs are laid, and these eggs are dark bluish green. Two broods are often raised in one season. Their nest is composed of three layers, the outside of roots, shavings, etc., then a layer of leaves, moss and grass, and this is cemented by mud. Inside of this is a soft lining of fine, dry grass. They eat many insects and should be protected by every farmer and fruit grower.

The dove, like the robin, is migratory, going far south in winter. They are so common that any description of them would be useless. The nest consists of a few twigs carelessly placed together, and in this two eggs are laid.

While the blackbird and the lark are occasionally killed for game, they should not be classed among the list of game birds and descriptions of them are omitted.

The band-tailed pigeon is a large and beautiful bird, loving the dense woods of our mountains. The eggs are white and, like the doves, they lay but two before hatching. They collect in Southern Oregon in great flocks, but here only a limited number are ever seen together. This bird is 16 inches long, it feeds upon acorns and berries and furnishes a delicious table fowl.

The sandhill crane, when young, is a fine table fowl. Their food consists mostly of roots and plants. This bird stands nearly five feet high, owing to its long, stilt-like legs. They breed in Oregon and farther north and return before winter sets in. They are often tamed and kept as pets.

The Great Blue Heron is nearly as tall as the crane, but is smaller in its body. Owing to living mostly on fish it is rarely eaten except when young. The bird is found only along the streams and marshes, where it finds its favorite food. It builds its nest in trees and seeks its food at night. It is said of this bird that the feathers upon its breast give forth a bright light at night that attracts the fish toward the heron.

The Golden Plover is not infrequently killed and is a delicate table bird. Its body is a brownish black with yellow spots, while the under part of the body is almost black. Farther east they frequent grassy plains in large flocks. They are larger than the Mountain Plover which is found here, but are no finer eating. The Mountain Plover is a brownish gray bird, frequenting the dry plains of the Great Basin in pairs, and comes west of the Sierras during the winter. The length of the Plover is about ten inches, while its wings spread a foot. Both of these birds vary greatly in plumage during different seasons of the year.

The Grass Plover, about the size of a dove and a good table bird, is found here at times.

The Snipes are the best small game bird found here. They frequent the low marshy sections or wet fields, where they feed upon worms and insects. The female lays four pale greenish grey eggs with brown blotches upon them. One peculiarity of the snipe is the long bill, which is very sensitive, so that the bird can tell when probing with it in the mud whether the object it has touched is fit for eating or not.

The long billed Curlew is the largest of the snipe family, frequently measuring 18 inches without its bill, which is seven or eight inches long. The bird weighs about two pounds and is a fine game bird. Like the other members of this family, it frequents the low, wet, marshy grounds or flats, where it feeds upon insects and worms. They are, perhaps, more abundant on the Pit river plains than in any other part of the State. Like all the snipe family, the nests are placed on the marshy lands, four olive green eggs are laid by the female snipe, and the young are quick to run about when hatched from the shell.

Eagle lake is a favorite resting place for ducks and geese in their northern and southern migrations, and here in spring and fall large numbers of these birds can be found.

Francis Smith & Co.'s Steel and Sheet Iron Pipe Works.

In view of the wide-spread interest now being manifested in the subject of irrigation, and also the prospective speedy renewal of the hydraulic mining industry in California, the matter of conducting water from its various and limitless sources to points where it can be made available for power or fertilizing purposes becomes one of growing importance. In this connection, the attention of readers of the PRESS is called to one of the oldest and largest manufacturing concerns in this city, Francis Smith & Co., who have for more than 30 years been making a specialty of the manufacture of riveted sheet iron and steel pipe for the purposes above mentioned.

Since making the first iron pipe for hydraulic mining in California, back in the fifties, down to the present day, this firm has been steadily growing in popularity, and during this time it has furnished pipe to all the principal mining camps west of the Rocky Mountains, both for milling and hydraulic use. The firm has also put in place the supply pipe for water works in many cities and towns on the Pacific Slope, notably among which is the extensive plant at Ogden, Utah Ter., completed during the year just past. In this instance, the water was successfully conducted to the water works from Ogden canyon, in the Wahsatch Range, a distance of seven miles, along steep and rocky mountain sides where there were many difficulties to overcome. This pipe is very strong and durable, being made of the best quality of iron or steel, double riveted and thoroughly coated inside and out with a special preparation of asphaltum. In some instances, where the expense and difficulties of transportation are great, the iron is punched and formed ready for making; tools for the purpose being supplied. Of course its lightness affords many advantages over any other kind of pipe in the saving of freight and the comparative ease with which it may be conveyed to and placed in position, as frequently happens, in almost inaccessible places. So much has this fact alone been appreciated, that many miles of pipe from this factory have been sold in British America, Mexico, South America, Australia, South Africa, as well as in hundreds of valleys and canyons all over this coast, wherever water wheels for mining or electric plants are operated, or water is brought from a distance for city supply or irrigating purposes.

The works at 130 Beale street, this city, are extensive and amply equipped with skilled workmen and modern appliances of every kind for turning out first-class work upon short notice, and at the lowest prices compatible with fair business methods.

AN ASBESTUS MINE FOR SALE.—The mine is located near Forest City, Sierra County, California. Ledge two feet wide. Croppings traced 2000 feet. For particulars, inquire of the undersigned at Forest City. B. F. DEBKESON.

FOR SALE.

A PLACER CLAIM:
ON KLAMATH RIVER.

CONTAINING SOME 400 ACRES PROSPECTING from 10 cents to 50 cents per cubic yard. Plenty of water and good dump. Address "HYDRAULIC," Box 2517, San Francisco, Cal.

WANTED.

A THOROUGHLY COMPETENT CHEMIST AND Metallurgist, who has had experience in treating Gold and Silver Ores by wet methods, to take charge of chemical department in large reduction works. State age, previous experience, references and salary expected. Address, X. Y. Z., Chicago, Ill.
Care Union League Club.

W. H. CONLY,

Mining, Commission.

LEGITIMATE INVESTMENTS A SPECIALTY: 331 Pine Street, Room 7, San Francisco; Telephone No. 5057.

GOLD SULPHURETS SAVED.

"GATES' PATENT" for saving Gold Sulphurets below quartz mills. Built by J. A. GILBERT, Jackson, California.

EVERY one in need of information on the subject of advertising will do well to obtain a copy of "Book for Advertisers," 328 pages, price one dollar. Mailed, postage paid, on receipt of price. Contains a careful compilation from the American Newspaper Directory of all the best papers and class journals; gives the circulation rating of every one, and a good deal of information about rates and other matters pertaining to the business of advertising. Address ROWELL'S ADVERTISING BUREAU, 10 Spruce St., N. Y.

If you wish to advertise anywhere at any time write to GEO. P. ROWELL & CO., No. 10 Spruce St., New York.

SHEET IRON PIPE

ALL SIZES, FOR GAS STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,
ALL SIZES.

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.
The weight or thickness of metal used, is graded according to service required, and pressures to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipes in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

A Complete Map of Solar System, best ever made, 10x13. The Names of all Cabinet Officers, with length of term. Pictures of all the Presidents, from Washington to Harrison.

ILLUSTRATION OF MAP PACKED READY FOR SHIPMENT

INDORSEMENTS.

BENSON J. LOSSING, LL. D., Historian: "Like a concave mirror, it reflects to a single focus an epitome of the essential elements of our national history, showing clearly at a glance the progress of the nation from its infancy to its present period of maturity."
 PROF. G. F. WITTER, JR.: "It is concise, complete, and in the study of political history indispensable."
 HON. J. C. BRANNER: "It can not fail to be of great utility to the people without regard to party or occupation."
 SUPT. G. R. SHAWHAN: "I think it very fine indeed."
 SUPT. A. F. CLARK: "Grandest success ever issued."

AGENTS' REPORTS.

"Received sample; sold 8 maps the first hour."
 "Magnificent map; my boy sold 12 the first day."
 "I sell 9 each day."
 "Have 7 agents at work selling 60 a day."
 "Called on 30 houses, sold 29 maps."
 "Made 16 calls, sold 21 maps."
 "I sell at every office, without exception."
 "Received the 10 maps, sold 7 before supper."
 "Sold 17 yesterday, will send order Saturday."

The **LARGEST AND LATEST U. S. MAP**, printed in colors, covers the entire back and is the best published. It alone sells for \$5.00. The complete Reversible Map (printed on both sides) is 3 feet 10 inches, by 5 feet 6 inches, mounted on rollers top and bottom, with tape on sides. These two maps sell separately for \$10.00

This Magnificent Map will be sent (mounted on rollers, postage prepaid) to subscribers to the MINING AND SCIENTIFIC PRESS for \$1.00 in addition to the regular subscription price of the paper. The Map will not be sold to any person not a subscriber nor to any subscriber who does not stand credited upon our books with an advance payment. The premium is the best ever offered in California. Address DEWEY PUBLISHING CO., 220 Market Street, San Francisco.

Langbein's New and Splendid Book on the
Electro-Deposition of Metals.

JUST READY.

A COMPLETE TREATISE

ON THE

Electro-Deposition of Metals

Comprising Electro-Plating and Galvanoplastic Operations, the Deposition of Metals by the Contact and Imposition Processes, the Coloring of Metals, the Methods of Grinding and Polishing, as well as Descriptions of the Electric Elements, Dynamo-Electric Machines, Thermopiles, and of the Materials and Processes used in every Department of the Art. Translated from the German of Dr. George Langbein, with additions by William T. Brann, editor of the "Techno-Chemical Receipt Book." Illustrated by 125 engravings. One volume, 8vo, 404 pages. Price.....\$4.00
Free of postage to any address in the world.

Abstract of Contents.

I. GENERAL HISTORICAL PART. CHAPTER I. HISTORICAL REVIEW OF ELECTRO-METALLURGY.
II. THEORETICAL PART. CHAPTER II. MAGNETISM AND ELECTRICITY. I. Magnetism. II. Electricity; Electro-Magnetism; Induction; Chemical Action of the Electrical Current—Electrolysis.
III. SOURCES OF CURRENT. CHAPTER III. GALVANIC ELEMENTS, THERMO-PILE, MAGNETO AND DYNAMO-ELECTRIC MACHINE.
IV. PRACTICAL PART. CHAPTER IV. ARRANGEMENT OF ELECTRO-PLATING ESTABLISHMENTS IN GENERAL. ELECTRO-PLATING ARRANGEMENTS IN PARTICULAR. V. TREATMENT OF THE METALLIC ARTICLES. (a) Mechanical Treatment; (b) Chemical Treatment. VI. PROCESSES OF ELECTRO-DEPOSITION: REDUCTION OF METALS WITHOUT A BATTERY (Electro-Deposition by Contact). VII. DEPOSITION OF NICKEL AND COBALT. 1. Nickeling. 2. Coating. VIII. DEPOSITION OF COPPER, BRASS AND BRONZE. 1. Coppering; 2. Brassing (Cupreous Deposit); 3. Bronzing. IX. DEPOSITION OF SILVER. X. DEPOSITION OF GOLD. XI. DEPOSITION OF PLATINUM AND PALLADIUM. 1. Deposition of Platinum; 2. Deposition of Palladium. XII. DEPOSITION OF TIN, ZINC, LEAD AND IRON. 1. Deposition of Tin; 2. Deposition of Zinc; 3. Deposition of Lead; 4. Deposition of Iron (Steeling). XIII. DEPOSITION OF ANTIMONY, ARSENIC AND ALUMINUM. 1. Deposition of Antimony; 2. Deposition of Arsenic; 3. Deposition of Aluminum. XIV. GALVANOPLASTY (Reproduction). 1. Galvanoplastic Deposition in the Cell Apparatus; 2. Galvanoplastic Deposition by the Battery and Dynamo Machine. XV. COLORING, PLATING, OXIDIZING, ETC., OF METALS. LACQUERS. XVI. APPARATUS AND INSTRUMENTS. XVII. HYGIENIC RULES FOR THE WORKSHOP. XVIII. CHEMICAL PRODUCTS USED IN THE ELECTRO-PLATING ART. XIX. USEFUL TABLES. INDEX.

The above or any of our books sent by mail, free of postage, at the publication price, to any address in the world.
A circular of 5 pages, quarto, giving the full Table of Contents of this important Book, with specimens of the illustrations, will be sent free of postage to any one in any part of the world who will furnish us with his address.

Our New and Enlarged Catalogue of Practical and Scientific Books, 83 pages 8vo, and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 24, 1892.

So far the weather for growing crops could not have been better ordered to secure a large return. Everything warrants the assertion that California and this coast in general, is on the eve of a more prosperous season than ever before enjoyed. This opinion is emphasized in the fact that the various lumber camps have arranged to increase their cuts, so as to meet an expected enlarged demand for lumber, for improvement purposes. Mr. Fillmore, general superintendent of the South Pacific Coast Railroad, says that his line will probably handle all of from two to three times more lumber in this year than they did in last year, and that the increased demand will come chiefly from agricultural districts. The favorable position of the mining debris bill as reported by telegraph from Washington, is cause for congratulation in its passage by Congress is almost assured, which if it becomes an accomplished fact will have a decidedly stimulating effect on our various industries, either directly or indirectly. Active railroad construction this year promises to be on a much larger scale than was witnessed last year.

The local money market continues easy with a plethora of funds reported, but if present signs do not fail a large increased demand for funds will set in soon from the agricultural districts, which will enlarge as the season advances. It is generally claimed that to move the wool, fruit, cereal and other products larger sums of money will be required this year than has been employed at any time within the history of the trade of this State.

MEXICAN DOLLARS—The market is weak at around 77 cts. The weak and declining markets for silver unsettle Mexicans.

QUICKSILVER—Receipts the past week aggregate 414 flasks. There was also received by overland railroad the past week 100 flasks, while in last month the shipments eastward aggregated 8 tons—5 tons from San Francisco, 2 tons from San Jose and 1 ton from Sacramento. The market is barely steady.

SILVER—The market is an enigma and difficult to solve, for with the United States more than absorbing all its products, mines shutting down and a certainty that Congress will pass a free-coinage bill, prices at home and abroad go down. With representatives of foreign banks, to whom we have gone for information on the subject, there is a growing impression that silver is being manipulated in England against Americans. It may be possible that the manipulators will go too far and get themselves into a trap from which it will be impossible to get out of without heavy financial losses. English mail advices report that in London the market is without support, not even India being a buyer, but it was claimed that in April there will be better support with India a large buyer.

BORAX—The past week 1,400 cts. were received from Oregon. The market is reported easier although quotations remain nominally unchanged. Overland shipments in last month aggregate 229 tons.

LIME—Receipts the past week aggregate 4,189 bbls. The demand is free at current quotations.

ANTIMONY—The market is barely steady. Eastern mail advices report as follows: Ordinary jobbing parcels are about all that have found sale, and prices are without remarkable change. Current quotations are 10½¢ for Hallet's, 12½¢ for L.X. and 14½¢ at 15¢ for Cookson's in wholesale quantities.

LEAD—The local market is essentially unchanged. Corroders are confident of a larger general distribution this year than ever before.

TIN—Plate is going into consumption, but so far as we can learn with no new business done—all that is being consumed was purchased some time ago. Quotations for both pig and plate are more or less nominal. Eastern mail advices report a slightly better demand. London cables to Iron Age reports as follows: Demand for Tin Plate has been slightly better, with the call chiefly for Cokes for Russia and Frisco. Charcoals and Teines are still unusually slow for the season.

PIG IRON—The market continues in buyers' favor both for spot and shipment. The consumption is not only large—but increasing. The agricultural works have taken freer than ever before. London cables report a fairly strong market, but this is offset by weak freights to this port. Eastern markets are reported as follows by mail: The most conspicuous feature is the further development of a tendency to sell crude material for delivery during the whole of the year at low prices. It is a confession on the part of some makers, and notably of the largest of them, that they do not hope for any improvement for 1892. Many leading authorities in the Iron trade do not go quite so far, but there are few who have the courage to predict any improvement before midsummer. Reports from the Mahoning and Shenango valleys are growing a little more definite as to the blowing out of furnaces, and from the Lehigh and Schuylkill valleys come a similar story. But the aggregate capacity thus involved is not great, and is at least partially offset by the blowing in of three new Southern furnaces, Florence, Clarksville and Dora being named.

COPPER—The market has gained strength, as indicated by us that it would. The little boomlet is based chiefly on the understanding among the producers, to which we refer editorially. Mines which last year produced 228,000,000 lb. are going to restrict their 1892 product to 250,000,000 lb. London cable to Iron Age reports as follows: Copper has been active and strong, with an advance in prices of about £2 during the week. Better demand from home consumers has helped the market, but the chief incentive was renewed reports of restriction of output in America and of European producers having been approached by American producers with a view to joint action.

COAL—Imports the past week aggregate as follows: Departure Bay, 3023 tons; Tacoma, 6772; Cardiff, 3388; Comox, 4750; total, 17,333 tons. The market is reported weak and in buyer's favor, with quotations nominally unchanged. It now looks as if there will be a very great increase in the consumption of this city and consuming points in this State. The very large crops will bring into the

arena a larger steam tonnage on the bay and rivers, more railroad business and more business in other branches in which coal is consumed as a motor generator. Notwithstanding the outlook for a large increased consumption, yet dealers think low prices will rule owing to the prospects favoring a very large wheat crop, which, if realized, will send vessels laden with coal to this market for outward cargoes.

Eastern Metal Markets.

New York, March 23.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.	41	9 1/4	11 1/2	4 2 1/2	19 5/8
Friday.	41	8 3/4	11 1/2	4 2 1/2	19 7/8
Saturday.	41	8 3/4	11 1/2	4 2 1/2	19 7/8
Sunday.	41	8 3/4	11 1/2	4 2 1/2	19 7/8
Tuesday.	40 1/2	8 1/2	12 1/2	4 1/2	19 1/2
Wednesday.	40 1/2	8 1/2	12 1/2	4 1/2	19 1/2

Tin is strong and high. Lead is easy. Copper is very strong at an advance. Quicksilver is easy, as is borax. Iron continues in buyers' favor.

Mining Share Market.

SAN FRANCISCO, March 24, 1892.

The market showed more life the past week than it has exhibited for some time past. Activity commenced in Hale & Norcross shares, accepted as quite a feather in the cap of the Brokers' Combine, and also that of the Mining Stock Association. The mill ring, it is claimed, did all in its power against an up move, and with some effect. Bob Morrow's reported brokers (Wall, Lang, Stauff, and one or two others), it is said, were always on hand to down the market as soon as it showed any degree of weakness. There is no denying that outside money men are not in the market, and rightly so, for until the insiders are forced to conform to the laws under which the companies incorporated, the game will continue hullo for the rings and assessments for outsiders. Probably the mines were never before in so favorable condition for working to pay dividends or for looking as the case may be, the later will continue to prevail unless insiders are compelled for it looks as if they would not of their own volition to do justice to all stockholders by sharing the bullion produced.

The Hale & Norcross management has instituted several needed reforms, that should tell with favorable effect in the interest of outside shareholders. But the latter should not lose sight of the fact that an adjoining mine to the north of the Savage, offered by those who controlled Hale & Norcross while the latter was being looted, and that the president of the Chollar Mining Co., whose mine joins to the south end, was vice-president of H. & N. With their drifts, etc., the latter mine can be looted either from the Savage or Chollar side.

Gas Sars, the Senator's brother, experienced a change of heart? In his weekly—should be weekly letters giving, as far as he sees fit, the work, etc., done in Belcher, in Seg. Belcher, and also in Crown, he reports finding some ore. Is this done for the purpose of collecting assessments, or does he see in the Hale & Norcross election the hand-writing on the wall? Be this as it may, it is some relief to hear even of strings of ore, in these days of porphyry reports for outsiders and rich developing work secretly reported to insiders.

Probably one of the most important events that has lately taken place on the Comstock is that of testing the more refractory ore by the cyanide process, in which ex-U. S. Senator Tabor of Colorado and other capitalists are interested. The following letter published by the Denver Times gives the result of one test:

VIRGINIA, Nev., Feb. 27, 1892.

Col. T. L. Wiscall, Esq., DEAR SIR: Yours of Feb. 23d at hand. I will write at length to-morrow or next day in regard to Havens, but to-day am pressed for time. One test on Ophir ore, which is the same as Consolidated Ad Virginia, shows extraction of 84 per cent in three days' leach, 20 mesh wire screen. I have a test one of 10 mesh, and I hope to get the same results. This test shows that the ore can be worked up to 95 per cent in five days. Mr. Lyman is greatly pleased. Yours truly, D. W. BALCH.

An assessment of 50 cents was levied this morning by the Hale & Norcross directors. It looks as if the brokers who gave their proxies to the Flood-Messer combination, to vote against the Brokers' Combine, have fouled their own nests. It is claimed by mining men that in the Hale & Norcross mine there are over 10,000 tons of ore extracted and ready for hoisting and milling, yet the Flood-Messer combination has an assessment levied, and for what? The same combination wrested the control of Andes from the Billy Brown combination, since when the stock has sold considerably below the assessments that have been collected.

The share market opened barely steady this morning, and after that fell to lower figures. We still think that prices will go some higher, although the points are for a break; but when top prices are reached, operators will be treated to a big decline, ranging from 50 to 75 per cent, so that the person who sells at an advance will make the money.

From the outside mining districts our advices continue uniformly good. It looks as if the managers of

MINING SHAREHOLDERS' DIRECTORY.

the mines in two of the districts are preparing to do something so as to sell out their stocks at higher prices, provided gudgeons will bite at the bait that will be thrown out.

From the Comstock mines our advices continue favorable. While the mines are in better condition than ever before for economic working and the paying of dividends, the inside rings are all wrong in every way and diverting the turning of bullion and part of the assessment money into their already overhanging exchequer. In Con. Virginia, developing work gains in importance. Official letters from Mexican are silent on a recent ore find, as are the Ophir letters on the find made some months ago. If Savage, Gould & Curry and Best & Belcher were differently managed, the rich ore in them would be shown up and distributed. The turning of bullion could be found so that the bullion would not be confiscated by inside rings. The ore strike reported by us in the Ward shaft is now officially announced. It is more important than insiders like the public to believe. Another strike was made in the shaft, but it is as yet a sealed book to outsiders. They are evidently preparing to show up, in one or more of the Gold Hill mines, the ore to the east which the late Senator Sharon was unable to take out, owing to water interference.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

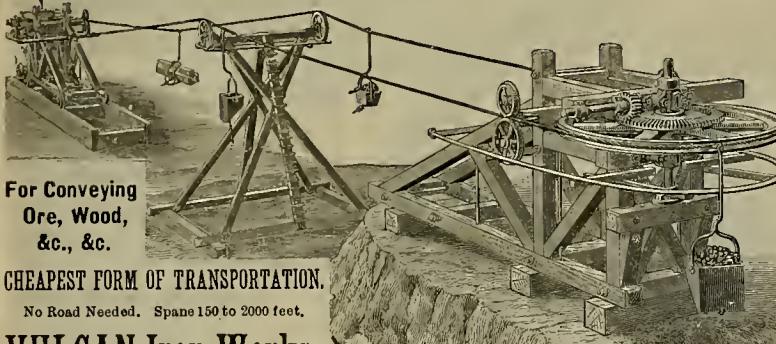

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

KENDALL'S PATENT, AUGUST 24, 1886.
CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

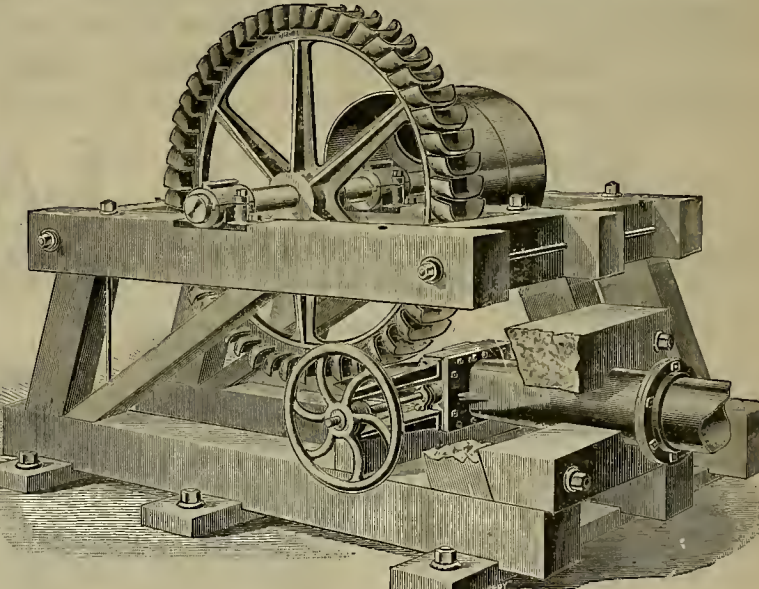

The Patentees and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List. MARSHUTZ & CANTRELL

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

CLADSTONE MINING COMPANY, C. J. Clark, M. E. Geul, Sup't.
 MESSRS. ADAMS & CARTER, San Francisco, Cal.—Dear Sirs: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have made competitive tests against them with other widely puffed-up concentrators and have always found the Frue in first place. When I built this mill (20 stamps), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 st mps, crushing a minimum of fifty tons per day, and do better work than the four-foot tables. They require no more attention than a four-foot table and haul it at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same beatings and wearing parts, require no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing here I will state that the ore has varied monthly from \$5 to \$20 per ton and the tailings from 100 lbs to 60 cts. per ton. I will conclude by saying that I cannot endorse the six foot Frue Vanner too highly, and it is the only table that I would have in my mill.
 C. J. CLARK, Gen'l Supt.

Price of 4-foot wide Main Belt Frue Vanner..... \$350, f. o. b.
 " " " Improved Belt Frue Vanner..... 800, f. o. b.
 " 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

 No. 132 Market Street, - - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs;" for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

(PATENTED.)
 Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

 and Nickel Plating.

F. A. HUNTINGTON,

— MANUFACTURER AND DEALER IN —

MINING MACHINERY.

HUNTINGTON'S IMPROVED ROCK-BREAKER.

The Main Features of this Machine are Strength, Ease of Adjustment, and Simplicity of Construction.

The movable jaw A is worked by the eccentric B and is pivoted at the bottom. The stationary jaw D is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt C. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt C and the jaw D. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

HUNTINGTON'S PATENT ORE FEEDER. PATENT SHINGLE MACHINE.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slime, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet-crushing and gold-saving it has no equal.

I CLAIM ESPECIAL MERIT IN THAT FEATURE OF THIS SYSTEM WHICH PREVENTS ALL FLOURING OF GOLD AND QUICKSILVER, and the consequent loss of gold that attends stamp-milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

This machine is so well and favorably known by all the principal lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. Send for Circulars.

Measurement of Ropes.

Circumference vs. Diameter.

For the following measurement of ropes we are indebted to Mr. A. S. Hallidie, President of the California Wire Works of this city:

A custom has obtained of measuring ropes by their diameters, and the consequence has been that many disputes have arisen between the seller and buyer, regarding the actual size of such ropes.

The custom that has generally prevailed heretofore has been to measure ropes by their circumference, and this custom is still in use where ordinary technical or business accuracy is required, and no other way of measuring a rope can be relied on for accuracy and fairness. This applies equally to all kinds of ropes, whether three, four or six stranded.

Take for example a rope made of six strands; its section is as shown in the annexed diagram, and there being no accepted rule as to where the diameter shall be measured, it may be taken at any part of the circumference of the hexagon formed by the six strands.

Now what constitutes a one-inch rope when measured by diameter? Is it one inch measured on a line cutting the axis of two opposite strands, or is it measured on a line cutting midway on the faces of the hexagon, or is it any point between? There can be no dispute as to this method of measurement, applied to a round bar of iron; but modify the circle to suit the conditions of a six-strand rope (nearly all wire ropes are thus made), and the trouble begins. The measurement on line "Dc" is one inch, but on line "Dp" it is only 0.911 inches; hence there is a cause for dispute that would not exist if the circumference was taken as the measure, instead of the diameter.

But even in measuring the circumference of a rope there is a possibility of unfairness, in the absence of a defined method of measurement, although this possibility is much reduced. Such ship chandlers and hardware men as are required to sell rope by circumference are very apt to take a piece of rope yarn and wrap it around the rope, and cut across the overlapping parts; but a mining or cable railway superintendent requires a more accurate way of measuring, and will take a piece of twine.

Better than either is a piece of ordinary writing-paper about one-quarter inch wide, which is wrapped around the rope and cut off at the overlap with a sharp knife. This will give the circumference measured on the faces of the hexagon, and determine exactly the size of the rope.

A careful consideration of the question will show this advantage in measuring rope this way; each division of space of the circumference is three times that of the diameter.

MEASUREMENT OF ROPES.

ter, hence the circumference is three times as accurate, and in every way, both as to fairness, accuracy and simplicity, is to

The Mining Building at Chicago.

The Mines and Mining Building for the World's Fair at Chicago is now well advanced in construction. The style of the building, as the engraving shows, is classic, and its dimensions are 700 by 350 feet, with a height of the main cornice 65 feet. There is a pavilion at each of the four corners 85 feet square and 90 feet in height, surmounted by a dome. Entrances to the building are on either side, besides the grand entrances at each end, which latter are 110 feet high and 82 feet wide, opening into vestibules. A 60 foot balcony extends entirely around the building, and the roof of glass is 100 feet from the floor. The total cost of the structure is estimated at \$350,000. S. S. Beman, of Chicago, is the architect.

In this building are to be grouped all those objects connected with the mining

To Visit the Mines.

All sorts of associations and organizations have made excursions to California in the past ten years, and have been entertained by our citizens. They have been shown the usual stock sights of the metropolis and the country, taken through the citrus fruit belt, the wine and raisin regions, looked at our manufacturing plants, universities, stock farms, the natural scenery, and all that sort of thing. But none of these visitors have been told anything about the mines of the State, and have never been taken to the mining regions.

For the first time, now, an Eastern excursion party is to be taken up country and shown the mines at work. The delegates to the National Educational Convention (which is to meet here in May) are to be shown the industrial features of the State. They are to be shown the centers of citrus and deciduous fruit interests, raisin and wine making, etc., and are to be taken to the mines. The system of hydraulic mining will be exhibited at Dutch Flat, Placer county, and probably the quartz mining at Grass Valley, Nevada county.

These are real newspaper men who are coming on this excursion; men who will write of what they see. They are not coming on a junketing expedition, but to examine into the resources of the State. It is well, therefore, that the mining industry is for once recognized. The California Miners' Association was requested to appoint a committee of reception to cooperate with the other

societies, and the following were appointed: S. K. Thornton, W. C. Ralston, Henry Martin, Chas. G. Yale (of the MINING AND SCIENTIFIC PRESS), and W. H. Meade. At a meeting held this week, a program was laid out. As to the mining features, the principal one will be the visit to the old Dutch Flat mines. There the process of hydraulic mining will be shown, as one of the claims will be run an hour or two for that purpose. The sluices will be cleaned up, and the whole process illustrated. The visitors will be given a miner's meal of beans, bacon, flapjacks, brown bread and coffee.

It is one of the hopeful signs of the revival of interest in mining in this State, when a large party like this is invited to see actual gold mining carried on.

The total bullion product of the Hale & Norcross mine for the month of February was \$28,083.08, and the average battery assay of all ore worked was \$21.82 per ton.

The Harqua Hala gold mines, Arizona, are reported sold to a New York syndicate,

MINES AND MINING BUILDING AT THE COLUMBIAN EXPOSITION.

be preferred. The diagram shown herewith will graphically explain my contention.

d = diameter of strand
Dc = " " circle
Dp = " " between hexagon sides
C = circular circumference
Cp = hexagonal circumference
Dc = 3 d = 1.000
Dp = 2.732 d = 0.911
d = Dc = 0.333
Cp = 9.14 d = 3.046
C = 3.14 = 3.1416
C = 1.031 Cp
Cp = 0.97 C

ALAMEDA COUNTY MINERS' ASSOCIATION.—An association of mining men in Alameda county was formed in Oakland last week. The officers are as follows: F. Chappellet, president; W. P. Perrine, first vice-president; J. W. Henderson, second vice-president; C. B. Rutherford, secretary.

AMADOR COUNTY MINERS.—A branch Miners' Association has been formed in Amador county, with the following officers: J. F. Parks, president; W. Truscott, J. Tregloan, J. Venning and J. Hoskins, vice-presidents; A. B. Call, secretary.

industry. Coal and iron, gold and silver, and all other forms of mining in this country, will be illustrated there. In the display of minerals, California will make the best show of any State if the collections belonging to the State are forwarded as intended. In mining machinery, however, thus far there has been no special preparation, and it is not probable that anything very extensive in that line will go from here.

THE Black Wonder is another Colorado mine now being hoisted. Senator Jones is reported as saying it is a second Comstock, because the assays run \$17,000 a ton. We do not believe Senator Jones ever said anything of the kind, because high assays of that kind amount to nothing whatever and any mining man knows it. It is hush and nonsense to suppose any amount of such ore has been found. That sort of an assay as a basis of values, would not have the slightest influence with an experienced miner.

THE MacArthur Forrest process is to be tried in Arizona shortly.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

Mines of Grass Valley.

GRASS VALLEY, CAL., March 25, 1892.

TO THE EDITOR:—In my last letter, written in this city, I promised additional information concerning the mines of this locality. Within the past few days things have been unusually lively about the Peabody mine, which is located just on the edge of the town. The old hoisting plant had become too small to satisfactorily perform the work and new machinery is now replacing the old. The work is being quickly accomplished, too, and before this letter is in print I have no doubt the new engine and hoist will be in operation. The Peabody mine is the property of the Nevada County Development and Improvement Co., with Alfred Tregidgo as superintendent.

The main working shaft is now down over 430 feet and sinking is in progress. The rich strike referred to in my former letter was made in the lowest part of the mine, and since that time more rich rock has been taken out. The new machinery will be powerful enough, it is thought, to sink to 2000 feet at least. The shaft has three compartments and is 13 by 8 feet. This mine has had a constant battle with water and is now raising a large amount. A Knowles, a Davidson and a Blake pump, each No. 7, are now employed in raising this water, but these will soon be replaced by a 12-inch plunger which will control the water for some time at least. The water is now raised from the bottom of the mine to the 250-foot level by the steam pumps referred to. On this level, it flows in a flume to the old pump shaft, where a 10-inch Cornish pump hoists it to the surface, a Pelton wheel furnishing the power. Rock from this mine has been milled for some time past in the Rodgers mill, a few hundred yards distant, but the company will probably build a new mill later.

Mr. Tregidgo has a proposition on foot which promises much for the mines and manufacturing establishments of Grass Valley and vicinity. The gentleman proposes to locate an immense electric plant on the Yuba river some miles distant, and from there distribute power and light to all points where it is required within a radius of many miles. The plan is entirely feasible, the only question being the securing of sufficient contracts to render his scheme a financial success.

At the Idaho mine, everything appeared to be running smoothly—in fact, the business of mining has been carried on for years at this great bonanza without anything of particular moment to disturb the even tenor of its way. The only thing worthy of mention, perhaps, is the fact that what appeared to be a new shoot of rich rock had been discovered on the 1900 level. Free gold was visible in much of the rock, a bluish quartz with foils of serpentinized material.

Melville Attwood, the veteran scientist and mining engineer, has been in Grass Valley for several days past and has made frequent visits to the Idaho.

Among the great mines of this locality is the Omaha Consolidated, Geo. Mainhart superintendent. The Omaha is sinking two working shafts, both being equipped with hoists of recent pattern. The shafts are each 1000 feet deep, levels being opened every hundred feet from top to bottom. The quartz is crushed in a mill of 28 stamps, which is under the same roof with the main hoist. In this mill are two batteries of five stamps each, and two of four each. About 50 tons of rock are crushed daily and the mine is on a paying basis. One hundred men are employed and the entire property appears to be under excellent management and one of the best examples of a well equipped, well managed mine in the district.

Near the Omaha is the Menlo, which is opened to the 300-foot level, a small force of men is engaged in development and good rock was being raised at the time of my visit. The property is being managed by Wm. D. Smith, and is among the promising mines about Grass Valley. The Homeward Bound, owned by the same company, is now idle, but operations will be resumed soon.

At the North Star mine, which, by the way, is one of the largest concerns here, everything is going on as usual. It has the most perfect equipment that I have yet seen. The great pump which raises the vast volume of water from this mine was formerly in the Chollar mine on the Comstock and is capable of doing much heavier duty than it is now called upon to perform. The mill is a model of convenience, every

piece of machinery and all the shafting being easily accessible and in the light.

The Brunswick, situated on the Idaho fissure, is evidently a coming property. It also occurs at the contact of diabase and serpentine rocks. Some splendid looking quartz was being taken out by tributaries at the time of my visit. The shaft is down 565 feet, and will be carried down to 600 feet, where a new level will be opened. The mine is supplied with good hoisting machinery and pumps. A four inch bucket pump lifts the water from the bottom of the mine to the 265-foot level, from which point an eight-inch pump of similar design controls the water from below, and also the surface water, which fortunately appears to be the larger amount.

The Empire mine is among the great prosperous properties of the district. Over 100 men are employed here and everything seemed to run like clockwork. The mine is equipped with powerful hoisting machinery, pumps, etc. It has a first class mill, a complete machine shop, and every modern convenience for the complete and economical working of the mine.

A new shaft is being sunk on the Hudson Bay, near the North Star, and the miners were expecting to cut their vein at any time, when I was there. The work is under the direction of Mr. Tregidgo.

Work, which some days since was stopped on the California, has been resumed. It is looked upon as one of the most promising mines in Grass Valley district.

The Central North Star Company has just completed a new hoisting and pumping plant, and active development is now looked for in that direction.

Prospectors, singly and in pairs, are scattered over the hills looking for new veins or opening old ones. As I said last week, there is abundant opportunity for work of this character, and the prospectors should receive substantial aid from the men of means of this city, and many paying mines would result from this combination of labor and capital.

The mines of Grass Valley and vicinity are not worked out, but they need just now a little more push and energy to bring the hidden treasures to light.

W. H. STORMS.

Coast Rivers and Harbors.

The House Committee on Rivers and Harbors has completed its consideration of the regular appropriation bill, recommending in all \$20,700,000, or nearly \$4,000,000 less than last Congress. On this coast the Columbia at the Cascades gets \$435,000. Among the appropriations above \$10,000 in the bill are the following: Humboldt harbor and bay, \$200,000; Oakland, \$150,000; Wilmington, \$20,000; San Diego, \$50,000; San Luis Obispo, \$30,000; Coos Bay, \$210,000; Yaquina bay, \$75,000; Tillamook bay, \$15,000; Gray's harbor, Chehalis river, \$30,000; Olympia harbor, \$25,000.

As to rivers, the Sacramento and Feather get \$150,000; San Joaquin, \$50,000; Petaluma creek, \$10,000; the Columbia at the Cascades, \$335,000; Upper Columbia and Snake, \$15,000; mouth of the Columbia, \$300,000; Lower Willamette and Columbia below Portland, \$50,000; Willamette above Portland, \$30,000; Coquille, \$25,000; south of Siuslaw, \$10,000; Snake river to Seven Devils mining district, \$20,000; Skagit, Steilacquamish, Nooksack, Snohomish, and Snoqualmie rivers, \$10,000; Snohomish slough, \$15,000.

The appropriations for the California rivers are much less than was hoped for. The Government Debris Commission showed in its report that a much larger amount than this would be necessary to put the rivers in proper condition. However, a start can at least be made with the amount suggested. The River and Harbor Convention people will be disappointed at the smallness of the appropriation suggested by the Committee.

HOME MANUFACTURED SCIENTIFIC INSTRUMENTS.—The A. Lietz Co., makers of scientific instruments, has recently been organized in this city, and the business of a private firm will now be enlarged and extended by the incorporation. The directors are Adolph Lietz, C. Weinmann, Otto Von Geldern, E. T. Schild and C. E. Grunsky. These gentlemen do not give up their engineering practice by becoming directors of the company, but their experience will assure the production of instruments of precision with every improvement. Some of these directors are practical field engineers, well known to the profession on the Pacific Coast. The new company will keep on hand an assortment of field and office supplies for civil, mining, irrigation, hydraulic, military and mechanical engineers. The Lietz surveying instruments manufactured are well and favorably known, especially de-

signed in details for the requirements of this coast. Mr. Lietz, the President of the company, is examiner and adjuster of instruments for the U. S. Surveyor-General, Wm. H. Pratt. In addition to the manufacture of special work, the company is in a position to manufacture and repair scientific instruments of any character for astronomical, philosophical, nautical and similar purposes.

Practical Matte-Smelting, No. 2.

MINERAL, IDAHO, March 25, 1892.

TO THE EDITOR:—On reflection, I find that my communication on "Practical Matte-Smelting," published in these columns on January 20th last, contained no allusion to what must be regarded as one of the most important and most obvious characteristics of this group of processes.

The unconscious omission has been made clear to me by the receipt of letters of inquiry, for the most part from the owners of mines who desire to inform themselves concerning this mode of ore treatment, and to whom my statements, while evidently striking, were not as conclusive as I could wish they had been. The omission to which I refer is this: While I said as emphatically as possible that matte-smelting under all circumstances would extract the gold, silver, copper, nickel and cobalt, and a portion of the lead, I neglected to state that it would extract them all at once, or rather all in one operation. The consequence is that we would not ordinarily have to make any differences in our smelting work, whatever be the metal that we desire to save. The variations in practice come from the nature of the accompanying substances (the gangue) that we desire to get rid of. No doubt every metallurgist who reads this will say that these reflections are unnecessary—that they are too obviously the resultants of what I wrote before, and I should have taken this view myself, except for the receipt of certain queries whose tenor was such as to convince me that, to the lay reader, these principles were not by any means too clearly understood, even by men who, like several of these correspondents, are very evidently possessed of great acumen and business sense. Such people are not, as a rule, concerned in an inquiry into the metallurgical principles of this or any other process. Their investigations tend to the all-important end of, "How much money can be made out of it?" This is a very proper inquiry, strictly in line with true progress, and entirely consonant with the celebrated definition of metallurgy as "the art of making money out of ore."

To render these inquiries a little less haphazard, I have prepared a list of questions, presented herewith, which embrace, I believe, all the essential requirements of matte-smelting. They embrace, in fact, more than that, for I do not see why an inquiry into the possible adaptability of a process should not include the comparative adaptability of every other known process, whereby the particular question as to the usefulness of a certain method becomes merged into the general question of what process, under given conditions, best satisfies those conditions. The question becomes, under the most favorable circumstances, not unlike a mathematical problem, where we deal in known and unknown quantities, and finally arrive at the answer through the solution of an equation. We might, I fancy, even solve the metallurgical problem in a similar summary way were it not for the too great preponderance of unknown quantities, which act quite as prejudicially in metallurgical as in mathematical analysis, though doubtless we can, by dint of investigation, place our theorizing upon a plane of equal exactness and certainty.

ACCURATE INFORMATION NECESSARY.

To properly decide upon the best mode of treatment, two conditions must be complied with. We must be in possession of copious and accurate information; and second, we must enter upon the consideration in the right spirit. That is to say, we must have no particular process to advocate. The engineer who has such a hobby sinks the metallurgist in the "process man" and loses his power of being useful to his clients and to his profession. It is a regrettable fact that more than one of our foremost authorities, acting in obedience to the natural but injurious tendency that leads the successful cultivator of a particular process to advocate it in season and out of season, have thus degenerated, losing the philosophic engineer in the huckster of patent rights!

Besides the possession of the unbiased spirit, there are certain facts with which it is necessary to familiarize one's self in order to efficiently perform that oftentimes vague duty of "reporting upon a mine" or deciding upon a process. In proportion to the thoroughness with which we get up these

facts, and familiarize ourselves with the surrounding conditions, will our reports become valuable. Mining reports are most frequently written to decide categorically some question of economic geology or of ore treatment, and demand for the most part no inconsiderable local knowledge in addition to the technical information which is the stock in trade of modern engineers.

THE QUESTIONS ASKED.

The queries which I am in the habit of propounding when I seek to solve the special problems of ore treatment are as follows:

THE ORE.—(a) How many measured tons are in sight? (No guesswork allowed nor any estimate of possibilities. Ore below the lowest workings has no place in this estimate.) (b) Give average contents of the whole mass (not picked specimens or small lots) in gold, silver, copper, lead and other valuable metals, each separately. (c) Give as closely as possible the percentages of the whole mass in quartz, oxide of iron, iron pyrites, zinc blende and every other constituent most carefully and thoroughly. Estimations by the experienced eye are often sufficient as to the composition of undecomposed gangue matter, but must usually be supplemented by a chemical analysis in the case of decomposed ores. Thus, an ore containing such unmistakable constituents as quartz, calc spar and pyrites would require no analyses to assist in deciding upon a process, for the mere ocular inspection of such is sufficient. THE PROPORTION of each of the constituents is very important, of course, and should be made the subject of particular inquiry. To make assurance doubly sure, one analysis or, better, several analyses of average ore samples are advisable. (d) What part of the gold is free to amalgamate? (e) What mineral is the remaining gold contained in? (f) What proportion of the silver is extractable by amalgamation of the raw ore? (g) What mineral holds the remaining silver? (h) In what form are the remaining valuable metals? (i) Give proportions of lead, copper, etc., as sulphides, oxides, etc.

COST OF PRODUCTION OF THE ORE.—Give estimates, based on costs of labor, materials, cost of necessary mining plant and roads, of producing one ton of ore and doing necessary dead work. This must include all interest charges, depreciation of plant, administration expenses, etc. Add to above the estimated cost of hauling one ton to the proposed place of reduction. (If a portion of the vein matter, easily separable from the remainder, is of different character, can be mined by itself, and is supposed to be amenable to more advantageous treatment than the bulk, describe it precisely as above.)

THE FUELS.—Wood—Give kinds and cost per cord of each sort, in large quantities, delivered at place of reduction. Charcoal—Give kind and cost per ton per cubic foot or per bushel of about 2600 cubic inches. Delivered in large quantities. Is the future supply certain? Coal and Coke—Give kinds, with prices delivered, per ton of 2000 pounds, large quantities. If the coal is a local variety, give analyses.

THE FLUXES.—Describe with detail the available sources of iron ore and limestone, giving analyses of each. Give cost per ton of each delivered in large quantities. The estimates of people engaged in quarrying and transporting such material are preferred. In all these cases, it is imperatively necessary to avoid guessing at costs. Thorough investigation is essential.

FLUXING ORES.—Whenever it seems probable that ores of a fluxing character can be had instead of the usual fluxes, iron and limestone, such deposits must be studied exactly as indicated above under the head "The Ore." The same is true to some extent of the iron ore and limestone deposits, which must be thoroughly studied, especially as to their purity and accessibility.

TRANSPORTATION.—How long is the wagon haul (or pack-train route), and for what price can sacked material or general freight be contracted in large quantities to the nearest railway or steamboat shipping-point? If such data are procurable, give the railway charges thence to some metallurgical center, as Denver, on carload lots of copper bars and matte, lead bullion, sulphide concentrations, crude ore, etc. The ordinary railway freight classifications and tariff afford little information on this subject, inasmuch as the companies invariably grant much lower rates—"special rates" as they are called.

WATER POWER.—Give quantity of unappropriated water in miners' inches, with fall and distance from proposed site. Of appropriated water, mention cost per 24-hour inch and power available. Discuss in this manner all possibly available sources of water power.

WATER FOR OTHER PURPOSES.—(Supply for battery, boiler, pans, etc.) Give avail-

able quantity in miners' inches, cost of bringing it to proposed site, and furnish analysis, or at least some data as to its chemical and physical properties, such as its effect in forming boiler incrustations. Give its temperature.

LABOR.—Character of labor supply. Nativity of the miners and laborers. Wages of miners. Ditto of surface laborers, furnacemen, amalgamators, mill hands and all existing classes. Does a labor union exist?

PRESENT FACILITIES FOR REDUCTION. Describe existing mills, furnaces, etc., their condition and adaptability to the work. Discuss the results of past working, percentage of recovery, cost of treatment, etc.

Give full information regarding accidental occurrences or uncommon facilities, such as exceptionally cheap native salt, carbonate of soda or other factor of reduction; also enlarge fully upon the possibility of securing other ores, fluxing or otherwise, describing each source as accurately as possible, in the manner prescribed for ores.

Include a statement of the financial expectations of the investors. Is there capital sufficient for the construction at once of a complete plant, or is it expected that a part only will be erected immediately and subsequently enlarged out of the profits of working?

A PROCESS SUITED TO THE CONDITIONS.

Once in possession of the above data, the requirement is not to fit some particular process into the conditions, but to find that process which is best favored by the conditions. It is not well to be too exacting; it is useless to expect a perfect fit. The desire should be to satisfy the most important conditions—the inexorable ones. As I hope to show elsewhere, some of the greatest metallurgical successes ever made were made in spite of strongly adverse conditions, which, however, were overbalanced by some single favorable circumstance of relatively great importance, a case in point being the ores of the Comstock lode.

It will be remembered by those who have made themselves familiar with my previous contribution that I offered to receive samples of typical ores, and advise upon their adaptability to this matting. Quite a number of such suites of specimens has come to hand, but as I anticipated, accompanied, as a rule, by such a paucity of information that the advice I could tender was in most cases of so tentative a nature that I fear it could hardly be deemed satisfactory or conclusive. Feeling the obvious need of each case, I therefore recommend to those who meditate an application of this sort, to myself or to any other engineer, a strict and thorough preliminary study of the situation upon the lines herein laid down—a careful working up of the questions, and then, and not till then, a reference of the whole case to the engineer. Any intelligent mine owner ought to be able to collate these facts, and I do not see why the engineer or metallurgist, with all this information before him, should not be able to form as reliable a judgment as to the working process to be ployed as he could possibly do if he were to make a personal visit to the spot—more so, in many cases, for it is one of the chief evils of the business of mining expediting that its conclusions are not often derived from sound premises, but are quite commonly the whimsical deliverances of some one who is popularly supposed to have "a tiptop judgment on a mine."

But it is useless and thankless to inveigh against the mining expert—that long-established and sometimes useful nuisance—whose very existence and appearance go far to prove the contention that "mining doesn't pay." Let us rather ask him what he would do in the following cases:

In illustration of the foregoing, I propose to introduce to the attention of the reader what I will call

FIELD STUDIES IN METALLURGY.

Under this head, I propose to cite such examples of the metallurgical and business questions which are commonly placed before engineers as will serve to illustrate some of the conditions under which the mining industry is found to lie, and which I have sought to include, tacitly, in the preceding list.

CASE I.

C, living in Central Nevada, possesses a group of veins, which, as I judge from specimens, carry oxidized silicious copper-silver ores, with and without lead; un-silicious copper-silver ore and undecomposed nonsilicious sulphides in intimate admixture of lead, copper (as copper pyrites), and zinc, carrying silver. Silver value averages perhaps 15 ozs., copper contents perhaps 10 per cent, and lead a considerable, but fortunately not too large a percentage. Of zinc there appears to be enough to be troublesome, but not enough to require special measures for its riddance. The

locality is not adapted for intricate or complicated processes, and, naturally, a single process is required which will treat all the classes of ore at one operation; and, as the claims are said to be equal to a production of 100 tons daily, a good reducing capacity is demanded. The ore contains probably nearly \$40 per ton market value in metals, and the silver is indifferently disseminated throughout, which fact, added to that of the oxidized condition of a part of the ore, precludes concentration by water as a general process. It has indeed been proposed to treat the sulphides by concentration in order to separate the galena from the accompanying copper pyrites and blende; but this is evidently faulty as sacrificing valuable copper and silver, and obtaining a comparatively poor product of galena by a wasteful, if cheap and rapid, process, which has, after all, to be eventually smelted. It would be much better to smelt the mixed sulphides and separate the products subse-

quently. If we review the various leading extraction processes, such as lixiviation in its various forms, amalgamation, etc., we do not, for obvious reasons, find them at all applicable to this case. We are facing one of those problems that have arisen of late in increasing numbers: the profitable treatment of low grade mixed sulphides. It is, in fact, a phase of the great base metal question, but it is a question that in this instance solves itself, for as nothing else can be done, C. will have to matte his ore, making a mixture of all sorts and running it down rapidly in a blast furnace (of large size on account of the zinc) and separate the resulting lead-copper, iron-silver matte into lead bullion and copper matte, while it is still molten, by the Marche's air-blast method or other cheap method, then shipping the two valuable products each to its appropriate refinery. If C. builds on this suggestion, he will realize the advantages of an inexpensive plant capable of rapid work and high extraction at low costs—the process, in fact, being to base sulphides what the stamp mill is to gold quartz and the pan to silver chlorides.

It is their simplicity that makes certain ores amenable to simple processes. It is their complexity that makes others yield readily to smelting. I believe that matte-smelting alone is applicable to the exceedingly complex ores cited. To illustrate the advantages of this complexity, I will further cite the case of M., who sends from Utah a sample of pure copper pyrites, and asks if it is suitable for matting. "Only this and nothing more!" The character of the substance—a plain sulphide of iron and copper—is such that at the first thought one is apt to answer yes; but so many qualifying conditions presently occur to the mind that the question arises: Would not some other method prove preferable in certain not unexpected contingencies? Would it be safe to recommend any process whatever in the absence of further data? Such a substance smelts easily to be sure, but it is equally docile to other processes. How about the Hunt & Douglas, the

localities in that region, particularly at the Imuris and Oso Negro mines, and at Nacozari. The general character of the ores is a mixture, more or less intimate, of galena, zinc blende, copper pyrites, iron pyrites, etc., with usually quartz or calcite. In the particular case to which I refer, it has been ingeniously proposed to roast these mixed sulphides in heaps, uncovered, and with considerable access of air, whereby two results are expected, namely, the removal of a portion of the zinc by sublimation and the decomposition of the galena by the liquation of the metallic liquation of the metallic lead, which, it is judged, will settle to and be found upon the ground at the conclusion of the operation. It is then the intention to ship this metallic lead to market as base bullion, while the remaining ore, now deprived of the lead and zinc (and sulphur?), wholly or in part, will be smelted into a matte in mixture with other silver-bearing ores in reverberatory furnaces.

In discussing this plan, it is necessary to remember that it is possible to reduce metallic lead in this way, for it is a matter of history that the lead mines of Illinois and Missouri, which produced a very pure galena, were first worked by the pioneers of that region, who, seeking lead for the purpose of making bullets, were accustomed to build piles of logs upon which the lumps of ore were placed, and, fire being applied, metallic lead soon ran out. But the process is very imperfect, and under no circumstances would the extraction of bullion by such means reach a tolerable percentage. There are no means of predicting before the actual trial what the proportion of lead extracted would be, but I should fear that the amount left in the ore would debar the use of the reverberatory for the subsequent fusing, for reasons well known to smelters who have used that style of furnace.

Again, we could not expect to derive much benefit from the influence of the heap-roasting on the zinc blende, for that substance would not probably be volatilized to any extent; but, as happens in ordinary roasting, would be decomposed into oxide and sulphate, which, being left in the ore, would prove nearly as obnoxious as the sulphide. Beyond the driving off of a portion of the sulphur, I think the operation of heap roasting would fail of good results. I would give the same advice as in the case of "C,"—that is, to fuse in cupolas to form a matte, either with the pyritic modification (Austin's process) or as in ordinary matting, according to circumstances; decompose the molten matte by an air blast, and sell the products.

HERBERT LANG.

Nevada Fall in the Yosemite.

Our artist takes us into the Yosemite and presents us a glimpse of a noted waterfall of that valley, from a point of view unlike anything before enjoyed in our columns, although we have, in past years, paid due homage to the Nevada fall.

The picture gives a profile view of the upper half of the waterfall. It well presents its volume and grace, but does not give adequate notion of its height, for the mass of water shown in the lower right hand corner of the picture has struck upon the ledge of rock, from which, it falls again in thinner sheet to the foot of the fall. In further characterization of the precipitation shown in the engraving, we shall use the appreciative words of W. G. Marshall, an English tourist, who gave an account of the Yosemite in his work, "Through America," which was published abroad eight or ten years ago.

The Nevada fall merits all the eulogy which has been heaped upon it by its admirers, for it is indeed a glorious leap, and one possessing some very remarkable and lovely features. It plunges 700 feet, yet this plunge is not perpendicular, for many feet below where it has topped the precipice, it strikes with its full force against a ledge of rock, and this causes it to shoot out anew into a still wider sheet; for, expanding now to a width of 200 feet, it descends the remainder of the distance in a network of fleecy curls, with an effect which is exquisitely beautiful, and which lends to the fall a peculiarly distinctive charm. The curled, crisp appearance of this fall constitutes one of the striking sights in the Yosemite. One might liken it to the arrangement or disposition of the sea waves as they gently break upon a flat, sandy shore. But to this must be added the active force with which each wave is thrown out; and then, if it is also borne in mind that there are hundreds of such wave jets in this one grand sheet—hundreds shot out at the same time followed by hundreds more while these are dying out of sight—some idea, incomplete though it will be, may be obtained of the remarkable form of this most beautiful fall.

PROFILE VIEW OF NEVADA FALL, YOSEMITE VALLEY.

Doetsch, the Longmaid-Henderson, or even the sulphatization in heaps, as practiced at many mines with profit and satisfaction? Were the ore as complex as those of C, there would be no room for such queries; but in this case, be it observed, it is the simplicity of the material that makes its treatment a matter of doubt and leads us to question the superior advantages in this instance of a process that, when used on complex ores, has no equal, and that becomes more and more useful in proportion to the complexity of the ore which it is designed to treat.

CASE II.

A very interesting case, parallel in some respects to that of "C," has been referred to me from a correspondent in Arizona. It is well known that in the Southern part of that Territory and in the northern part of the adjacent State of Sonora, there exists an extensive belt of base sulphide ores of a very intractable character, but so rich in the valuable metals, especially in silver, copper and lead, that their beneficiation is a very important matter. Such ores are being, or have been, produced at several

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

WILDMAN.—Amador Record, March 24: At the Wildman mine they have run seventy-eight feet south from the shaft on the 900 level and the ledge has continually widened out until now it measures thirteen feet. These developments are certainly very encouraging to the owners as well as to the people of Sutter Creek.

SUMMIT.—The Summit claim lies along the mother lode, and adjoins the old Eureka, which yielded \$75,000,000. It is less than a mile from Sutter Creek and on its southern boundary it also adjoins the South Eureka, lying between that and the original Eureka. An incline shaft was sunk 700 feet by the original owners, but after reaching that depth work was suspended owing to their inability to handle the water with the machinery in use and no work has been done since. The developments made at that time were more than satisfactory and furnished convincing proof that with suitable machinery for working the mine it would prove a valuable property. It is now owned principally by John and John R. Tregloan, both prominent and experienced mining men. They, with others, who are cognizant of the facts connected with the history of its former workings entertain no doubt as to its ultimately being developed into a big-paying enterprise. It is to be hoped that the owners will conclude arrangements whereby the mine may be worked.

LINCOLN.—The Lincoln mine is located near Sutter Creek and is controlled by American and foreign capital. For ten years the property has been leased and worked upon the tribute plan. At present the creditors of a deceased lessor are operating it under the superintendency of Robert Pope. The present lease expires next June and we understand that the company may then decide to work the mine themselves. The claim is 3000 feet in length by 600 feet in width. A shaft has been sunk 1000 feet and knowing ones say there is an abundance of ore in the mine from the 500 level down that will pay a handsome profit. The company own a water right consisting of ten miles of ditches; reservoirs; a milling plant of 40-stamps; two large hoisting engines, boilers and heavy pumping machinery. For several weeks past a representative of the company has been here investigating the affairs of the mine.

KENNEDY.—Amador Ledger, March 26: There is a report afloat that the Kennedy mine has been sold to an English company for \$2,000,000. The rumor, however, is not generally credited, but there is no doubt that negotiations are in progress looking to its purchase. At the Bright claim, the upraise from the tunnel has been driven to the surface, meeting with ore the whole distance. The quartz, which assays from \$6 to \$7 per ton, is thought to be good for at least a \$4 milling proposition, and with a large vein, such as is met with here, this certainly holds out a prospect for a big paying concern. The work now in hand is to sink the shaft below the tunnel, so as to tap the ore at a greater depth and determine its quality. George Gites, who is running the sulphurets-saving plant below the Kennedy mill, is arranging to leave next month to start up the Plymouth Rock mine, near Milton, Calaveras county. He will leave his works here in charge of experienced hands. Sidney James is running a small mine and 5-stamp mill above Pine Grove, with encouraging results.

Butte.

FIVE HUNDRED DOLLARS A TON.—Oroville Reporter, March 24: Wm. Fitch, of Oroville, visited the Rainbow mine at Yankee Hill on Sunday and made a thorough inspection of that valuable property by invitation of Superintendent W. H. Fowler. He brought back with him a number of samples of rich ore and informs us that the incline is down 170 feet on the ledge and that the deeper they descend the richer they find the ore to be. A crosscut has been run 70 feet and where the ledge is tapped it is six feet in width. Mr. Fitch says there are fully 200 tons of rock on the dump and from the results that he obtained by using a hand mortar he is satisfied the ore will average \$500 a ton. There is a six-stamp mill on the mine run by steam power, this was started on Monday of this week and will be run until a sufficient quantity of the rock has been crushed to give the mine a thorough test. Should it prove as valuable as it now promises a large mill will be erected during the coming summer.

THE BLUE LEAD.—Oroville Mercury, March 24: Billy Will brought \$250 in gold yesterday that was taken out by three men in one week from the Bishop mine on the Blue Lead at Bangor. All the miners there have splendid prospects and new ones are constantly being opened. The lead seems to underlay the entire country along the foothills between Bangor and the Feather river. No doubt many rich mines will be developed.

El Dorado.

DARLING.—Mountain Democrat, March 26: We get word that the Darling mine has closed down, perhaps temporarily. The vein is said to be large and ore of good grade, but it seems the mill does not give satisfaction, as it only works about ten tons in 24 hours. This is far too low for a ten-stamp mill. The average should be not less than 20 tons a day, and two men is quite sufficient to attend a mill working that amount of ore or even five times as much. Millmen sometimes make a mistake in reducing ore too fine. Rich gravel is now being taken out of the Stewart mine at Weaver Hill. A bed of gravel about 20 inches thick has been found by Mr. Zimmerman near the Pacific House, on the Lake Valley road. It has long been believed that there was rich gravel at that place, and there is no good reason why it should not extend along the ridge for miles. Work is progressing at the Toll House mine, near Smith's Flat. The water is being pumped out of the Rogers mine at the same place. Gregory Bros. have struck rich gravel in their mine, which is so far developed as to make it certain that they have a large amount of gravel ready to drift out. We get favorable accounts from the mines on the north side of the county.

Calaveras.

TO SINK.—Calaveras Chronicle, March 26: Mr. C. W. Caldwell, of San Francisco, is with us again. Mr. Caldwell is the owner of the south ex-

tension of the B. K. & D. M. Mauna mine. He is preparing to sink a shaft and then will erect a mill on the mine. We hope he will have a good mine. B. K. and D. M. Mauna are running a tunnel in their mine to tap the main shaft. Some very rich ore has been taken out of this shaft. The Hoosier mine is running in full blast, and it will be but a few days before the mill will be in operation. We have a few other mines here that will soon start up, and we think our little town will soon look up again.

PUTTING UP A MILL.—Calaveras Citizen, March 26: Messrs. Pellaton, Pfeiffer, Fisher and Wait, owners of the Democratic Gravel Mine, in Tunnel Ridge, are erecting a three-stamp mill and have it nearly completed. The mill purchased is the one formerly used on the Tuttle mine, in Chili Gulch. It will be but a few days before the mill will be in operation.

QUAKER MINE.—The work of sinking the vertical shaft in the Quaker quartz mine is progressing favorably under the careful attention and intelligent management of our friend Hugh McCoskey, who has been installed as the superintendent. The shaft will be sunk 200 feet, when it will then have attained a depth of 600 feet.

Inyo.

HIRSH.—Inyo Index, March 23: Developments in the Hirsh mine are very encouraging. Shipping ore is being taken out and indications point to a large body of high grade. A. W. D. Carroll, from Lone Pine, reports the work by Messrs. Mills, Austin & Co. as progressing favorably.

Los Angeles.

A SMELTER.—California Farmer-Miner and Oil Reporter, March 28: Yesterday, Maj. L. C. Moreland announced his intention of erecting a smelting plant in this city, and after consulting a number of prominent business firms in regard to the advisability of placing such a plant here in Los Angeles, met with such encouragement as to decide him that a smelter established here would not only pay him a handsome interest on the outlay, but would prove of inestimable benefit to the business interests of our city. At present, thousands of tons of valuable ore pass through Los Angeles for El Paso, Denver, Omaha, San Francisco and other points. All this ore could be smelted here at a much lower rate than at any of the points above mentioned, and a smelter of 20 tons capacity could be kept running night and day. Major Moreland is an old-time miner; has been raised in mines in Montana, old Mexico, and Southern California, and has accumulated quite a handsome competence, and feels confident that Los Angeles is the most available location for such an enterprise. Another reason why such a plant has so much advantage here is the fact that the natural gas just struck here would furnish motive power much cheaper than it could be obtained at any other point that has yet been mentioned.

Mono.

BODIE CON.—Bodie Miner, March 25: We are extracting ore of fair grade from upraise above south drift No. 2, 700 foot level, and from stope north of No. 1 upraise above the 500 foot Jupiter shaft level. The seams of ore in drifts continue good. We have commenced to extract ore from north of No. 1 upraise, 700 foot level. We will commence to crush Mono ore as soon as we get through cleaning up from test on Summit ore.

Nevada.

VULCAN MINE.—Grass Valley Telegraph, March 23: The Vulcan mine is situated between the North Star and Hudson By mines and has been leased by the following named persons. John G. Logan, John Edwards, W. J. Barker, Patrick Farrell, Geo. Browning, Wm. Thomas, Frank K. McDavid. The company is now drifting on the top ledge but will soon begin to sink for the bottom ledge. Ore from the Vulcan has always been of good quality and the ledge is from 10 to 14 inches thick.

A RICH STRIKE.—Nevada Transcript, March 26: John Skewes, superintendent of the Gold Flat mine, was in town to-day with some of the finest looking quartz we have seen for many a day. It came from the 300-foot level of the above mine. The specimens brought in show free gold and are heavily charged with galena and high grade sulphurets. The general character of the quartz is good, there being a "lively," rich appearance about it, which miners regard as a good sign. The ledge was struck a little below the old workings, and varies from twelve inches to two feet in thickness. Some years ago this mine was worked by Bruce Lee, who sunk a shaft down 300 feet and then ceased operations. It was formerly called the Potosi. A few months since the property was purchased by Grass Valley and Nevada City parties and a fine pumping and hoisting rig erected. The work of cleaning out and repairing the old shaft was begun and has not been entirely completed as yet. It was while the work was progressing, and a little prospecting at the same time, that the strike was made. The stockholders are highly elated over the prospects.

Placer.

DIVIDE MINING NEWS.—Plover Herald, March 25: We learn from a gentleman who has recently been on a tour of inspection of the Forest Hill divide that he found the mines of that section quite prosperous, and the outlook altogether encouraging. The pioneer quartz mine at Damascus, he says, has recently tapped the ledge with a new tunnel, at a lower level, and is taking out ore from a strong vein that will average \$75 a ton. At the Red Point drift mine, they are working over 50 men, and the mine is paying well. The Hidden Treasure is paying well at present, and is working about 40 men. At the Paragon, Breece & Wheeler's mine at Bath, the last clean up averaged \$4.02 to the car. At the Gray Eagle, the gravel is found to be so thoroughly cemented that it is thought they will have to erect a mill for crushing it. The Drummond quartz mine continues to yield rich rock from a strong ledge. At the Mayflower, they are, at present, doing a good deal of contract work in the way of opening new ground, etc.

Plumas.

RICH DEVELOPMENTS.—Quincy Bulletin, March 25: During the past few months, McGill & Standart have been running a lower tunnel from North Canyon into the Drury mine, to tap the chimney worked on a higher level. About ten days ago, the chimney was reached in this new level. It is reported to be a 7-foot ledge of high grade ore, estimated at \$25 per ton. This is an important development, both

for the lucky owners and the interests of the county generally, and for Indian valley especially. It will probably result in the erection of a large mill, near the bed of North Canyon, and the operation of the mine on a large scale. The quartz deposits west of the present workings, are practically inexhaustible. Backs of 1200 feet can be secured. The ore can be mined and milled at a small expense. Water power is handy and cheap, and plenty of timber is on the ground, thus giving every facility for the economical operation of the mine.

THE MERCURY.—Another very flattering quartz prospect has been found in the vicinity of Newtown flat. The location is called the Mercury, and was recently made by C. J. Lee, Chas. Blakesley and J. P. Richards, who are now developing it. The ore vein runs across the Fairstake, a gravel mine owned by Thomas & Thompson. Beginning in the bed of the Tate ravine, the ledge extends northwesterly toward Newtown flat. On the ridge, the owners have put a shaft down on the vein about 20 feet. It has not been sufficiently developed to judge accurately of the extent of the ore body, but in the ravine it is about 6 feet wide. The quartz extracted prospects about \$7 per ton. Development work will be continued.

San Bernardino.

SILVER REEF.—Press and Horticulturist, March 26: C. O. Barkeley and S. S. Nowlin, two of the directors of the Riverside Silver Development Company, returned last night from the Silver Reef mines on the desert, about 90 miles northeast of here, bringing with them a load of very fine carbonate ore that assays over \$700 per ton. Expert miners pronounce it the finest ore ever brought to Riverside. These gentlemen say they have a ledge of paying ore over 30 feet wide that will run from \$12 to \$40 per ton, milling ore, and a rich streak next to the hanging wall, from 8 to 22 inches thick, that will run from \$600 to \$1000 per ton of rich carbonate ore, such as they brought in.

ROSE.—Last week D. A. Wheeler, superintendent of the Rose mine, came in from the mine, bringing a gold bar weighing over 100 ounces. The company is now engaged in changing the plant from the dry process to the wet process, as by the latter they can work the ores much cheaper, and extract more of the valuable metal. As they go down, the vein shows up very satisfactorily. In running a crosscut, the workmen struck a 4-foot vein of ore that runs \$10 to the ton. As it will cost only \$2.50 per ton to extract and treat it, some idea may be gained of what a bonanza a 4-foot vein is. Next week, this mill will be running on the wet process.

San Diego.

JULIAN AND BANNER.—Julian Sentinel, March 26: C. E. Smith and George Plant are following a promising lead of quartz on the Ella, which may bring them soon into clover. A number of men has commenced work on the Madden, which has always turned out rich ore, and Dave Lane is opening up the Kentuck with fair prospects. It is in the air that the famous Golden Chariot mine which used to turn out \$75,000 to 20,000 per month—ore that went \$80 to \$100 per ton—is to be reopened. Al Frary and Bob Johnson have had their untiring efforts of the past many months rewarded by striking pay rock in the Eagle. They expect soon to have it come along now steadily richer and richer. The Antelope and Warlock mines are both idle at present, caused by circumstances unavoidable. Rich ore is found in both these mines and they should be worked every day. There has been a good deal of ore milled within the last year, the average being \$34 a ton. We understand that work will be resumed on these mines soon. The legal complications that have befallen the Helvetia mine have not as yet been determined, although rumors are rife to the effect that Mr. Havermale is negotiating with outside capitalists to pay off the indebtedness and start up the mine. The water is being pumped out each day and everything kept in running shape, so that at an hour's notice men could be put on and ore buckets again sent up the shaft.

Shasta.

AN EXCITEMENT.—Redding Free Press, March 26: From G. L. F. Reeo, of Round Mountain, we learn that there is quite a mining excitement in that locality. Nearly everyone has taken up a location. The ore carries silver and lead. While no well defined and extensive ledge of lead ore has yet been discovered, the prospects appear very flattering. A considerable quantity of rich float has been picked up by prospectors, and it is hoped that the all-important question of a smelter for Shasta county will be settled affirmatively by the discovery of large quantities of lead ore, it already having been settled that there are a number of coal deposits capable of furnishing large quantities of that important mineral. Parties from Grass Valley are negotiating for the Stowell gold and silver mine near Iron Mountain. Stowell has a rich and extensive mine and has been asking \$500,000 for it. He could have sold it for a less figure several times. The Hidden Treasure mine in the Iron Mountain district has been bonded to Messrs McCormick & Commore for six months, the consideration being something like \$40,000, provided a sale goes. Of course the mine will be developed and prospected by the bonders. This property is owned by Mat Hume, George Dix and a man named Hough. Our old friend E. P. Vanderveer was in Redding this week from Copely. Van and his partner, Mr. Bullard, are making money on Flat creek, working an arrastre on rich ore. He says that they have been averaging \$20 to the ton from rock by this old-fashioned process, not counting the large amount of gold that is lost. The Flat Creek district is very rich, but the gold is very fine and hard to save. R. G. Dunn has bonded his patented mine at Copper city to a man named McMillan for a period of ninety days. McMillan represents Eastern capital.

Siskiyou.

MINING ON HUMBURG.—Siskiyou Telegram, March 18: Hunt's new custom quartz mill on Humburg is now completed and will be started up next Tuesday, and will begin by crushing 30 tons of rock for Van Nader, after which about 50 tons will be crushed for Henry Marion. Fahl and Lawson are running an arrastre and crushing about a ton and a half a day of \$11 rock; their ledge is looking fine, and is about seven feet in width. Harrison and Tom Keaton are working the Harrison mine and are taking out some excellent ore. Some good ore is being taken out on the lower level at the Spencer mine. Cartright & Phillips are taking out some

very good ore at a depth of 250 feet. This last is conceded to be the best mine in the camp by mining men. B. B. Jackson is running a tunnel to strike the same ledge higher up the mountain. Andy Rabbitt and partner are taking out some very good ore on the old Schoolhouse ledge. They have also located the old Knapp mine, which they intend working. This last was rich, there being over \$60,000 taken out of it at one time. Mr. T. J. Baker and P. Donohue, on their mine which they have located, have taken out some exceedingly rich ore. The lode is between gneiss rock and porphyry, which is the best indication of a good paying mine. Van Nader is down between 15 and 20 feet on his lode, which is now about 3 1/2 feet in width, and is prospecting very well. The Humburg hills are full of prospectors and the outlook for the camp for the summer is very bright.

Trinity.

EAST FORK.—Trinity Journal, March 26: Supt. E. M. Hoffman is getting things in shape at Barney Gulch and will be ready to run the mill soon. At the North Star mine they have the tramway extended up to the Poorman mine, having nearly a mile of track laid. They are now building an ore bin and repairing the flume and ditch, and, when this is done, will be ready to start the mill on Poorman rock. Grant Day has a lease on the Fritz mine and has several tons of ore on the dump, which he will soon have crushed at the Enterprise mill.

GOOD WAGES.—Rohnerville Herald, March 23: Writing from Francis, New river, our friend McAtee says: Noble and son are making good wages on Pony creek. Shook & Co., on the same stream, are doing well. Information comes from a reliable source that work will be resumed on the Ridgeway when spring opens. Funds will be received from England to push the work. Aside: Two prospectors (first of the season) passed last Saturday on the way to Virgin creek, expecting to find the "Lost Packers' mine," said to have been richer than the "Pegleg" of Arizona desert.

Tuolumne.

THE BONANZA.—Tuolumne Independent, March 26: It is rumored that the Bonanza case will probably be settled within a week. A compromise will have to be effected, or the suit will shortly be brought to trial. It is to be hoped that an agreement can be had satisfactory to all parties. The property is valuable, the mine having already produced millions of dollars. The owners are very confident that there are other pockets not yet discovered.

NEVADA.

Washoe District.

CON. CALIFORNIA & VIRGINIA.—Chronicle, March 24: 1750 level.—In working out and upward from the bottom of winze No. 2 sunk from the 1650 level, we continue to extract ore of fair quality. Have also extracted some milling ore at the point where the upraise carried up from the crosscut run west from the southwest drift made connection with slopes on the eight floor. Have continued to extract ore of average quality at the point where the upraise from the southwest drift 70 feet north from the uth line of the California ground connected with the eighth-floor slopes. In the east crosscut No. 3 from the main south drift some ore has been extracted, 1800 level.—Along the south end of the drift running south from the crosscut run east from the winze No. 1 sunk from the 1750 level we have continued to extract ore from the sill floor upward of milling value. There has been extracted from all parts of the mine during the week 1025 49-5000 tons of ore, which was shipped to the Morgan mill. The average value of all of the ore worked at that mill during the week, 980 tons, was \$29 99 per ton. Bullion shipped to Carson Mint, assay value about \$16.657 36.

OPHIR.—1465 level.—From the end of the crosscut run east from the drift run north from the drift run west from the winze 122 feet below the sill floor of the 1300 level, an upraise has been carried up 26 feet in a porphyry formation and stopped. From the above mentioned north drift, at a point 35 feet in from its mouth, an east crosscut, No. 2, was started and has been advanced 15 feet, showing bunches and streaks of ore assaying from \$5 to \$10 per ton. Have continued the work of repairing and retimbering the main south drift on this level. Bullion shipped to the company's office in San Francisco, assay value, \$9,771 45.

MEXICAN.—On the 1465 level the crosscut running east from the bottom of the winze sunk 200 feet down from the end of the crosscut running west 132 feet in from the main north lateral drift near the south boundary line of the mine, has been advanced 11 feet; total length 166 feet, in hard porphyry and stopped. From this east crosscut, at a point 32 feet east from the winze a south drift has been advanced 12 feet in porphyry with quartz of low assay value.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 20 feet; total distance west from the shaft 1780 feet. The face is in porphyry. From the Union Con. south lateral drift from the joint west drift, at a point 1570 feet west from the shaft, a west crosscut started near the south line of the mine has been extended during the week 26 feet; total length 47 feet; the face is in clay.

UTAH.—The west drift from the shaft station, 340 level, was extended 59 feet; total length 337 feet; face in porphyry formation showing clay separations.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft 1,780 feet; face in porphyry. The north drift from the Kenosha tunnel was advanced 40 feet; total distance, 797 feet; face in soft porphyry with some quartz and clay.

ANDES.—On the 420 level west crosscut No. 2, from north drift on east side of the ledge, has been advanced 20 feet; face in quartz and porphyry. Easting timbers in main north drift.

BEST & BELCHER.—900 level: East crosscut No. 1 has been advanced 22 feet; total length, 57 feet; face in soft porphyry and stringers of quartz. Have finished repairing west crosscut No. 1 and extended same 7 feet; total length 124 feet; face in porphyry and stringers of quartz.

400 level.—Northwest drift from west crosscut No. 1 has been extended 15 feet; total, 48 feet; face in soft porphyry, clay and quartz.

HALE & NORCROSS.—On the 900 level the north

prospecting drift started from the top of the north upraise, 50 feet above this level, was advanced 15 feet; total length 60 feet. This drift has connected with the Savage Company's ore slopes on our north boundary. Near our north line on this level are cutting out a winze to connect with the 1100 level slopes. On the 1500 level, No. 1 winze, started 75 feet north of the incline, was sunk 15 feet; total depth below this level, 30 feet; bottom in quartz and porphyry, giving low assays. On the 23d instant commenced shipping ore to the Brunswick mill, and have shipped to date 350 480-2000 tons. The mill began crushing on the 25th. During the week we have hoisted 233 cars of ore. During the month we milled 780 tons of ore at the Nevada Mill, yielding \$12,255 86 in bullion. Average battery assay of same, \$19 25.

CHOLLAR.—Are making repairs on the various levels. The south drift from west crosscut, 1640 level; is out 145 feet; face in porphyry.

POTOSI.—The winze is now down 146 feet below the 1500 level; bottom in soft porphyry mixed with quartz that gives low assays. The north raise, 60 feet south of north line, 1130 level, is up 30 feet; top in porphyry with streaks of quartz of good quality.

WARO COMBINATION SHAFT.—The southwest drift from the shaft, 1800 level, is out 1,275 feet, face in mixture of porphyry, clay and quartz.

ALPHA.—The west crosscut from north drift, 550 level, is out 16 feet; face in low grade quartz.

EXCHEQUER.—The east crosscut 150 feet south of north line, 600 level, is out 322 feet, face in porphyry.

BULLION.—Have completed repairs to south drift, 1300 level, and started an east crosscut, 350 feet south of north line, which is now in 10 feet; face in soft porphyry.

OCCIDENTAL.—The winze from west crosscut in the south drift 350 level is down 30 feet; bottom in pay ore. The crosscut on the 400 level, started to meet the winze sunk from the 350 level, is in 29 feet and continues in pay ore. The crosscut from north drift, 750 level, at a point 300 feet from the station is in 12 feet; face in low grade ore.

CON. NEW YORK.—The raise from No. 4 west crosscut, 650 level, is up a distance of 71 feet; top in quartz showing bunches of fair ore.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 610 feet; face in gypsum and porphyry.

SAVAGE.—During the week we have hoisted 785 cars of ore from the 750, 950, 1150 and 1400 levels, and shipped to the Nevada mill, 666 tons; milled 665 tons; average battery assay, \$17 85. Bullion yielded for the week, \$8,316 70.

CROWN POINT.—The east crosscut from the top of the raise, 500 level, has been extended in a total length of 54 feet at which point it was stopped; face in porphyry. Have started a south drift from No. 1, west crosscut, 160 level, and are out now 36 feet; face in soft porphyry, with streaks of pay through it about 8 inches wide, giving good assays.

BELCHER.—We are saving some pay from No. 2 raise, 300 level, and opening out on the second and third floors. Are timbering the 1300 level slopes from the south raise.

KENTUCK.—The north drift, 160 level, is now out a total distance of 164 feet, at which point it was stopped and an east crosscut started from the end of it, or at a point about 30 feet south of the north line. This crosscut is out 22 feet, and the face in porphyry and low-grade quartz of a favorable appearance.

JUSTICE.—The west drift, 490 level, is now out a total distance of 720 feet; face in hard rock. There has been no work done in the raise from the 822 level during the past two weeks as we are engaged in taking out the old pump column from the north compartment of the shaft.

CONFIDENCE-CHALLENGE.—The joint Confidence-Challenge west crosscut from north drift, 200 level, is out 130 feet; face in porphyry. The joint Confidence and Challenge raise from the north drift, same level, is up 7 feet, having been commenced during the week; top in quartz of no value.

SCORPION.—The joint drift from the 900 level of Union shaft was advanced 10 feet during the week, making its total 747 feet. The ground is softer and requires timbering, which has delayed the usual progress in advancing the drift.

SEG. BELCHER.—The raise from south lateral drift, 1300 level, is now up a total distance of 27 feet; top in porphyry with streaks of quartz through it assaying from \$5 to \$15 per ton.

YELLOW JACKET.—Shipping to the Brunswick mill 35 tons of ore daily. The usual prospecting is being done.

IMPERIAL.—We are taking out some fair ore from streaks and the old fillings on the upper levels.

Ferguson District.

WORK COMMENCED.—Correspondence White Pine News, March 26: I am now located in this new mining district, which is about forty miles south of Bristol and about the same distance from Pioche and Hiko. Real work began here about the first of this year, though some prospect work had been done the past summer, and assays obtained that went as high as 1716 ounces in silver and \$5 in gold, out of the Discovery claim. Since we came here January 1st last, several other miners and prospectors have come here and been prospecting and opened their new finds. Many new claims have been located that promise to be of great wealth. There are now six mining claims being worked and every one of them has found rich born silver ore and yellow chloride in veins running from two to six feet wide, and every man here is excited to the highest pitch. Since we came here assays have been obtained running as high as 1974 1/2 ounces. The formation is porphyry, slate and lime, with plenty of quartz and granite. The ore lays in what miners call a contact between slate and porphyry. The camp is all alive and many coming and more talking of coming with stocks of supplies, and we hear of two parties intending to put up a quartz mill here in the near future.

Bristol District.

LEACHING ORE.—Correspondence Pioche Record, March 26: John Savor of the Mayflower mine says he has an abundance of leaching ore on hand ready to extract and can obtain samples of ore all the way from 30 to 300 ounces of silver to the ton. The Mayflower was worked by chlorides years ago, who extracted a large amount of good ore therefrom which they sold to the Bristol smelter, realizing handsome profits upon it. The mine fell into litigation and judgments were rendered against its own-

ers, which were purchased by John Roeder, John Savor and others. Mr. Savor will put the mine in shape this summer for advantageous working upon the advent of a railroad to Pioche.

LEASE.—James C. Nicol has taken a lease from Tom Gillan on the old Michigan mine near Bristol, and will proceed at once to work on the property. Mr. Nicol thinks there is a good showing for some pay ore, and was in town this week getting supplies to begin work. No work has been done on this property for a number of years, it, like a good many others, being relocated every year, instead of being represented by labor. When a railroad comes here and our resources are known to others, that kind of representing won't do. It will have to be done with a pick and shovel and not with a lead pencil.

Glencoe District.

PROMISING.—Salt Lake Journal, March 26: Glencoe Mining District, in White Pine county, promises to come to the front this season as one of Eastern Nevada's banner camps. A number of fine mineral deposits have been uncovered there, and if mill-run tests of ore soon to be made in Salt Lake are satisfactory, as anticipated, it is safe to predict that there will be a boom for that region equal to that now raging at Creede and Cripple creek, Colorado.

Tuscarora District.

NAVAJO.—Times-Review, March 25: No. 2 winze, 350-foot level, extended 10 feet, showing small seam of good ore. No change in the other workings.

BELLE ISLE.—The crosscut from No. 1, 350-foot level, extended 12 feet. West crosscut, same level, extended 19 feet.

NORTH BELLE ISLE.—West crosscut, south 400, extended 11 feet. North intermediate drift above the south 500-foot level, extended 19 feet, the face is looking better than at last report. No. 4 drift south, 500-foot level, extended 14 feet. West crosscut, same level, extended 13 feet. Hoisted 29 cars second-class ore.

DEL MONTE.—Second level—No. 4 raise from stope extended 30 feet, showing seams of good ore and looks very favorable. Hoisted 14 cars of second-class ore, assay value \$51 per ton. Third level—No. 1 raise has been advanced 30 feet, top is in vein matter.

NORTH COMMONWEALTH.—Second level—Footfall raise from north drift put up 15 feet, exposing seam of good ore, produced 14 cars of good ore, assay value \$49 per ton.

MONTANA.

BUTTE MINES.—Montana Mining Journal, March 23: A new water column was placed in the Mountain View shaft a few days ago. During the week the Lexington Company shipped 15 bars of bullion of an estimated value of \$24,000. The water in the Alice was lowered to the 1500 floor yesterday, which will permit of access to this level. The Montana Consolidated mine, which belongs to the Anaconda Company, has been adorned with a new pump. The Hibernia is being worked through the shaft of the Nettie. Both properties belong to the Colorado Company. Superintendent Helehan, of the Emma Nevada in Loop Gulch, reported work progressing in the 200 of that property. Samples of ore from the vein of the Pandora in the Camp creek district, assay as high as 9000 ounces per ton. The ore is a black sulphide and is found only in small doses. A shipment of 150 ounces ore was made from the Brackstone last Saturday. This is the first shipment made from this mine, as it has only recently been opened up. The Blackstone is situated northwest of Walkerville. The new shaft for the Anaconda hoisting engine was shipped from the East last Thursday morning. Work at the mine, it is thought, will be resumed on the 2d of April. The Biston and Montana Company will soon commence to increase its force at the Mountain View and Harris-Lloyd properties, to which spurs of the railroad are now being built. By the time the spur work is finished the force of the former property will be double what it is now. A specimen of copper glance weighing 1800 pounds was shipped from the Mountain Consolidated mine to Baltimore a few days ago. From there it will be sent to France for exhibition. The ore was taken from the mine about two years ago, since which time it has been kept on exhibition in the hoisting works.

NEW MEXICO.

HANOVER IRON MINES SOLO.—Southwest Sentinel, March 24: A deal which has been going on for some time has been consummated. Thirty-one iron mines in the Hanover district were sold to a syndicate of Pennsylvania capitalists for \$110,000. Of the mines sold nine belonged to W. H. Newcomb and nine to John Bockman, both residents of this city. The deal was closed by Lewin W. Barringer, a Philadelphia attorney, for the purchasers, and the mines were transferred to John W. Brock as trustee for the company. The mines purchased comprise most of the valuable iron mines in the Hanover district, and they are believed to be the best iron mines in the Territory. The ore runs about 60 per cent iron, and has been used extensively by the Socorro and El Paso smelters for fluxing purposes. Just what the purchasers of these mines propose to do with the ore is not known, but for the present at least they will continue to fill the contracts for ore which were made by Mr. Newcomb and which have been turned over to the company in the deal. These contracts amount to about 30,000 tons per annum. The company will purchase the Silver City and Northern railroad if possible, but, failing in that, will build a new line from Hanover to this place over which to ship their ores. The speedy development of the Hanover iron mines is now assured, and if the company should build a railroad from Hanover to this place there would be sharp competition for the Hanover business and more favorable rates could be obtained for the shipment of copper and zinc ores from the Hanover mines. The silver City and Northern railroad company owns a number of iron mines in the Hanover district, and there are some in the camp which are still owned by individuals who do not appear to be anxious to sell. The greater part of the money paid for these mines has been paid to residents of this city and will be used in the development of the resources of the country. Mr. Newcomb will work with the new company and will soon leave for the East on important business.

The California Miners' Association.

Officers, Committees and Constitution and By-Laws of the State Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized. The officers of the Association are as follows:

HON. J. H. NEFF.....President.
W. C. RALSTON.....Secretary.
THOS. B. EVERETT.....Ass't Secretary.
H. PICHOR.....Treasurer.

VICE-PRESIDENTS.

NAME.	COUNTY.
R. F. Grigsby.....	Napa
Henry Martin.....	Trinity
Geo. W. Thomas.....	Marin
Frank R. Wehe.....	Sierra
Woolston Banghart.....	San Mateo
R. H. Campbell.....	Siskiyou
Jas. O'Brien.....	Yuba
Frank Fitzgerald.....	Inyo
A. B. Call.....	Amador
Dixon Brahban.....	Plumas
J. F. Ryan.....	Humboldt
Aaron Bell.....	Shasta
H. O. Harvey.....	Sacramento
D. K. Perkins.....	Butte
A. M. Hardie.....	San Luis Obispo
A. Tregldgo.....	Nevada
Ex-Gov. H. G. Blaisdell.....	Alameda
T. B. Morse.....	Calaveras
Hon. A. M. Clerk.....	Fresno
Hon. J. K. Luttrell.....	Sonoma
J. J. Crawford.....	El Dorado
R. M. Folger.....	Mono
Geo. F. Hoyte.....	Orange
R. McMurray.....	San Francisco
W. S. Chapman.....	San Francisco
I. C. Stump.....	San Francisco
C. T. Lacy.....	San Francisco
A. J. Ralston.....	San Francisco
John W. Maxwell.....	Tuolumne
Hon. R. Clark.....	Colusa
C. F. Reed.....	Pleasant
Chas. Bogan.....	Mariposa
James H. Lawrence.....	Merced

EXECUTIVE COMMITTEE.

Hon. J. H. Neff, Placer.	H. A. McCraney, Lake.
Louis Glass, San Francisco.	Jas. Tunstead, Marin.
Cal Dan M. Burns, S. F.	A. M. Bryant, Mono.
Col. F. McLaughlin, Butte.	W. K. Aldersley, Napa.
S. K. Thornton, S. F.	Chas. Bogan, Mariposa.
Wm. Ireland Jr., S. F.	Jas. H. Lawrence, Merced.
Hon. C. W. Cross, Nevada.	Hon. J. M. Walling, Nevada.
Chas. G. Yale, San Francisco.	D. C. Fixel, Orange.
J. B. Hobson, Placer.	John Spaulding, Placer.
Hon. Edw. Coleman, Nevada.	W. W. Kellogg, Plumas.
Hon. A. Walrath, S. F.	M. M. Drew, Sacramento.
Hon. J. K. Luttrell, Sonoma.	Thos. R. Church, S. F.
Ex-Gov. H. G. Blaisdell, Alameda.	John Hays Hammond, S. F.
H. N. Jno. Daggett, Siskiyou.	Myron Angel, S. L. Obispo.
Hon. E. C. Voorheis, Amador.	N. J. Brittan, San Mateo.
E. W. Fogg, Butte.	George M. Pinney, Sierra.
John F. Davis, Calaveras.	R. G. Hart, Shasta.
John Boggs, Colusa.	A. W. Dana, Sonoma.
Hon. Thos. Fraser, El Dorado.	A. Hewell, Stanislaus.
Mr. McDonald, Fresno.	O. P. Berry, Sutter.
W. H. Pratt, Humboldt.	O. McFarlane, Tuolumne.
Hon. Patrick Reddy, Inyo.	G. O. Kimball, Tehama.
J. O. Miller, Kern.	John McMurray, Trinity.
	O. G. Mayo, Yuba.

FINANCE COMMITTEE.

Louis Glass, San Francisco.	Edward Coleman, Grass Valley.
Wm. Ireland Jr., S. F.	S. K. Thornton, S. F.
N. J. Brittan, San Mateo.	John Hays Hammond, S. F.

COMMITTEE TO FORMULATE AND PROMOTE THE ADOPTION OF AMENDMENTS TO MINING STATUTES.

Hon. Niles Searles, of Nevada.	H. I. Thurwell, Placer.
Hon. O. W. Cross, S. F.	Hon. J. K. Luttrell, Sonoma.

COMMITTEE OF CONFERENCE WITH RIVER AND HARBOR CONVENTION COMMITTEE.

R. G. Hart, Shasta.	Wm. Ireland Jr., S. F.
Frank McLaughlin, Butte.	J. B. Hobson, Placer.
Hon. J. K. Luttrell, Sonoma.	

DELEGATES TO WASHINGTON.

Hon. Niles Searles, of Nevada County.	
Hon. J. K. Luttrell, of Sonoma County.	
Robert McMurray, of Nevada County.	
J. B. Hobson, of Placer County.	

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

Sec. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of the organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members selected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

Sec. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

Sec. 3. The President and Secretary of the Association

shall hold *ex officio* President and Secretary of the Executive Committee.

Sec. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of this Association.

Sec. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

Sec. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

Sec. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of the Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

Sec. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

Sec. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may unite with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

Sec. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as such County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by the Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittees as they may determine. They shall fill all vacancies of the officers of the Association or members of any committees. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

Sec. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

Sec. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

Sec. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

Sec. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

Sec. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of such intended meeting.

Sec. VII.—The Secretary and Treasurer shall receive such compensation for their services as the Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

MECHANICAL PROGRESS.

Machine Mining.

Lewis Stockett, of St. Louis, Mo., contributes to the *Colliery Engineer* an article on "Machine Mining," from which we take the following:

Ten years ago, in this country, machine mining was looked upon almost entirely as an experiment in which few had any faith, or were willing to hazard capital in. To-day the experiment has become an assured success, and machine mining is fast becoming the rule and not the exception. In the State of Illinois, for the year ending July 1, 1890, out of a total of 12,638,364 tons mined by all methods, 2,881,983 tons were mined by machinery, being 23 per cent of the total. In the Fourth Inspection district of this State for the same period, of a total of 3,716,464 tons mined, 1,615,453 tons, or 43.5 per cent of the total, were mined by machinery; and in the Fifth Inspection district, covering the same period, of a total of 3,240,204 tons mined, 1,101,262 tons, or 34 per cent of this total, were mined by machinery; and succeeding reports will show increased percentages.

Pennsylvania, Ohio, Indiana, Michigan, Iowa, Missouri, Kentucky, Alabama, and several Western States, will show percentages, that, compared with previous years, will show that machine mining is steadily increasing, and there are scarcely any of the coal-producing States or Territories of the Union where machines are not being or have been used with more or less degree of success, in other respects as well as financially, when under proper conditions, and earnest effort has been made to make them succeed.

Ten years ago the miner that worked with or after machines was a "blackleg" to be shunned by his fellow-workmen, and often followed his occupation at the risk of the "boycott," personal injury, and even loss of life from those opposed to the innovation. This has all changed, and to-day the machine miner and laborer form a large portion of the mining class, and are often the commanding influence. Where machine mining has been successfully organized and carried out, the result has been greater regularity of work and better wages for employes.

So far, machinery for mining is confined to machines for "undercutting," "shearing" and "drilling," and which, by cutting the vein horizontally or vertically, and drilling the holes for blasting, prepare it for the work of the miner in charging, blasting, assorting, loading, and timbering. Machinery for these latter purposes has not been introduced, though experiments are continually being made with machines for loading, and the writer has seen two patterns that in a large vein with good roof would do the work very well; it is to be hoped that a successful machine will finally be devised to relieve this the most laborious portion of securing coal. The cleaning of coal from its impurities, where the same exist, and throwing them back into the gob is a task that can hardly be accomplished by machinery, which can only be expected to lift the mass from the floor and deposit it in the cars. Where these impurities do not exist in too great an amount, the cleaning can be done more thoroughly and more economically by proper coal-cleaning machinery placed in the tipples outside.

Electric batteries for firing blasts after the charges are tamped, and the use of lime cartridges and power wedges for breaking down the coal may be mentioned as attempts to do the breaking down by machinery, but have not come into general use.

For timbering, machinery has nothing to offer, and it is only indirectly that a saving can be effected in this department of the work; by deep undercuttings, the roof if tender is shattered less by the blasts; and as machine mining gets over the ground much quicker than the older method, rooms are driven their length and finished before timbers need replacing. To offset this, places for machinery are generally driven as wide as possible, in order to give the machine the advantage of working steadily and preventing the loss of time in moving frequently from one face to another; this will take more timber, and it becomes a nice point to determine on the score of economy just where to draw the line between the two.

The power used to operate mining machinery has been almost entirely compressed air. Of late electricity has become a recognized factor as such, and there is no doubt but that in time with improvements in application, it will become more and more so. At present the most successful machinery being driven by compressed air necessitates its use, and for this reason is preferred by the writer.

Diversity an Industrial Factor.

There is nothing stationary in industrial conditions. They are in perpetual motion, and the panorama of changing production is an endless exhibit on a ceaseless wheel. There is nothing stereotyped or perfect in human ingenuity, and one invention succeeds another, as the clock of time strikes each succeeding hour. The age is inventive, and the skill of modern man has its aims and emoluments in that direction. There are no fixities along this line, except the industrial fact that products or appliances in their manufacture have no mortgage on the future. What is supreme in the market to-day may be in the underflow to-morrow. It is on this grindstone that competition sharpens its knife and makes its mince-meat of men who fail to appropriate the advantages of new and progressive methods. So wide and vital are these changing conditions that it has become an economic necessity to increase and diversify the specialties of manufacture so as to reap a dollar from the seed of a hundred cents. Public enterprise is generally in response to this industrial and commercial necessity.

The farmer finds financial anchorage in a diversity of crops, and when one fails in product or price he pays his taxes and buys his boots from the increased value of the rest. The merchant adopts the same procedure, and finds his prosperity enhanced by introducing variety into his business, and in manufacture it is equally as necessary. In the established staples of production, elasticity is a law of success, and where the man of business ignores these flexible conditions, he dries with the pea that fails to grow with the pod; in other words, his business stagnates, and if sustained for a period at a loss of time and money, is inevitably destined to starve itself to death. There is no lack of such corpses in the financial graveyard, and perhaps too many men living to-day, by being too conservatives in their modes and methods, are simply postponing their funeral expenses. Hence it is necessary to multiply the lines of product in many of our industrial establishments, and thus avert the consequences of glutted markets or no demand.

The escape is in diversity. The class of goods that make a successful run one season is generally supplemented by a reaction of over-supply in the next, every man reaching for the same big plum. It is but a logical sequence to these fluctuations that a combination of interests where several varying lines are amalgamated is good business policy when wisely carried out. This places the manufacturer in command of the varying phases of public demand, by giving him a wider range of products with which to meet existing mercantile conditions, and thus insure more stability and a wider range of operations. It is wise to recognize the logic of events in this instance, and keep pace with the march of progress and public needs, and in no one direction is the line of security and prosperity so accurately drawn as in the deployment of industrial products. —The Lumber Worker.

THE BANDSAW MILL.—How rapidly the band mill has converted the mill owners of the country! Conceived with the idea of saving a reasonable percentage in the sawing of walnut and a few other valuable cabinet woods, it is now, by long odds, the mill of mills, says the *West Coast Lumberman*. The first manufacturers of this band mill had a long and weary struggle against the deeply rooted prejudice in favor of the circular. Then, when it demonstrated that it would really do good work in the afore-said cabinet woods, at a considerable saving of lumber, the white pine men said it would never be fast enough for their use. But they were quickly won over to its favor. Then the yellow pine and cypress men said it would not do in their timber, but experience proved them wrong. The millmen of the Pacific Coast were certain it could never be made a success in the redwood and fir of their region, but it is noticed that it is going into their mills right along, and they are beginning to brag about the big cuts they make with it, and this last victory makes the band mill almost complete master of the situation in the United States.

THE BROWN GUN.—The system of great gun construction, known as the Brown segmental tube wire-wound method, which, it is claimed, is destined to revolutionize the fabrication of heavy ordnance, has undergone a completely successful trial, under Government auspices, at the works of the Pennsylvania Diamond Drill Manufacturing Co. at Birdsboro, Pa. The Brown gun is to be constructed of a tube of accurately adjusted segments of steel, extending from breech to muzzle, wrapped with many layers of steel wire, applied under heavy pressure,

and lined with an inner tube to carry the rifling and endure wear and tear of repeated firing. A complete gun has not yet been finished, but a sample cylinder, representing the powder chamber of a five inch gun, was subjected to the trial yesterday. The external diameter was a trifle under 16 inches and its length about two feet. Three and a quarter pounds of powder gave the enormous pressure of 52,850 pounds to the square inch. The highest pressures used in modern guns does not exceed 35,000 pounds. *Manufacturers' Gazette.*

SCIENTIFIC PROGRESS.

A Ships' Compass.

It is said that much of the unsteadiness of ships' magnetic compass needles can be obviated by the following device: In place of one needle, or set of needles, there are several mounted concentrically one above another. The vibrational period of each needle, or set of needles, is slightly different from that of the others. The lowermost needle carries a pair of stops, which project upward so far as to embrace all of the other needles of different vibrational periods, and so as to prevent them from moving independently through more than a limited number of degrees. The weights of the several needles are so proportioned as that the momentum of each is, in the normal condition of vibration, about equal to that of the others. The swing of such magnetized needle is, of course, hampered not only by their mutual attractions, but also by the stops before mentioned, that are affixed to the lowermost needle. The result is that—the vibrational periods of the several needles not being commensurate one with another—the whole combination has virtually no vibrational period. The combination is not free to respond to any single isochronous swing. The attempts of any individual needle to assume such isochronous motion are frustrated by the interferences of the other members of the combination. There are various methods of mounting the needles, which, however, it is hardly necessary that we should describe. One objection that we see to the device is possible derangement by a sudden jerk, etc.

An Artificial Aurora.

An experiment showing "molecular bombardment" and the "aurora" may be made by rubbing an incandescent lamp on this clothing, or on paper, leather, sheet rubber or tinfoil, when the bulb will become filled with light; if you stop, it grows dark. If touched with the finger, the filament and the interior will be a bright glow, lasting from one to three seconds; if touched again, it is repeated; by drumming or drawing the finger slowly over the glass, the light is quite continuous. If rubbed on newspaper in an absolutely dark room, the larger letters can be read at a distance of two or three inches. Fan the bulb with a sheet of rubber eight or ten inches away, but do not touch the glass; it will light the same quite bright if the fanning is very rapid.

The lamps used were the 16 c. p., 20 and 22 volts. Most of the miniature lamps will give the light, but not all; the 110-volt store lamps will not.

It is evidently charged through the glass, as the glow will occur if the metal parts are enveloped in rubber. Everything used should, of course, be dry. It seems to be an electrophorus effect, the discharging only exhausting a section at a time. —T. B. Heimstreet in *Electrical World*.

MANGANINE.—Manganine is the name of a new alloy, consisting of copper, nickel, and manganese, which has been brought on the market, says *Iron*, by the German firm, Abler, Haas & Angerstein, as a material of great resisting power. The specific resistance of manganine is given as 42 microhm centimeters, that is, higher than that of nickeline, which has hitherto passed as the best resisting metal. Another advantage of manganine is its behavior under variations of heat, the resistance, it is claimed, being affected only in a minute degree by high temperatures. It is therefore adapted for the manufacture of measuring instruments and electrical apparatus in general, which are required to vary their resistance as little as possible under different degrees of heat. A further interesting fact is that, while other metals increase their resistance by the raising of the temperature, that of manganine is diminished.

NEW ALLOY.—A French contemporary is experimenting with a new alloy for armor plates, projectiles and guns, viz., a steel containing one per cent of chromium, two per cent of nickel and not more than

0.4 per cent of carbon; the steel is first melted in an open hearth, and in the ordinary way. When the silicon and manganese in the metal have attained their proper proportions the nickel and chromium are added successively in the form of ferro-nickels and ferro-chromes, or in the shape of a double ferro-chrome and nickel.

DO WE TEACH GEOLOGY.—The cultural aspects of civilization are due to geologic structure, but in how many of our institutions are students taught to appreciate topography or configuration of the earth's surface and its relation to structure, or to observe with inquiring eye the forms and contours of this landscape? The student usually learns the chemistry of certain nicely-arranged hand specimens of hard rocks, and memorizes the names of leading fossils, or the crystallography of minerals under the guise of economic geology. As a result, the study is supposed to be merely the study of hard rocks and curious fossils. Although the student knows these by sight, he cannot trace a rock-sheet above the ground or below it, or see the great soft terenes void of fossils and rocks which make up this larger area of our country, and cannot appreciate the broader relations of structure to agriculture, hygiene, climate and civilization. Hence, the great unfossiliferous terenes are unknown; for example, the nonmountainous regions of the West and South, over which in places one may travel from the Rocky Mountains to the Gulf of Mexico without finding a fossil, a crystal, or a building stone. —Robert T. Hill.

OCEAN DEPTHS.—The eight or nine mile depths in mid-ocean, declared very probable by Maury, are not found by later actual investigation, according to the *Engineering News*. A depth of five to six miles is very exceptional, and the average appears to be about 2,500 fathoms for the waters of the globe. The greatest depth yet found is 4,575 fathoms (5.2 miles) south of the Ladrone, and 4,561 fathoms north of Porto Rico, near St. Thomas. The deepest sounding, then, in the North Atlantic, is 4,561 fathoms, and in the South Atlantic bottom is always found at a less depth. The Mediterranean gives 2,150 fathoms as a maximum to date, and the deepest known water in the Indian Ocean is 3,199 fathoms. The polar basin seems to grow shallower as the North Pole is approached, and bottom was found at 72 fathoms in the most northern sounding made. These soundings, so far as made, also disprove the theory that the ocean bottom is a counterpart of the dry land in its irregularity of surface. It has its peaks and deep gorges, but as a rule, the surface lies in very gentle undulations, without abrupt or steep slopes.

SUNSPOTS AND MAGNETIC DISCHARGES. In a recent communication to the Academie des Sciences, M. Janssen, the eminent French solar astronomer, stated that he saw nothing in the facts hitherto brought to light to warrant the hypothesis of there being any relation between sunspots and terrestrial magnetic disturbances. He was not, however, prepared to dogmatize on the subject, but would prefer that inquiry should be made of foreign meteorologists if at the time of the fine aurora recently observed in America and Europe, magnet disturbances took place also in the Southern hemisphere. If it were thoroughly ascertained that nothing of the same kind took place in the Southern hemisphere, M. Janssen was of opinion that we would be in possession of a fact which would render the theory of solar influence a very improbable one.

PURIFICATION OF CHEMICALS BY COLD. Pictet, who has taken out a patent for the process, has discovered that from the purest chloroform of commerce, if cooled down to about 70°, there separates out a crystalline body, which is then drained from the part which remains liquid. This liquid portion is then exposed to a temperature below -100°, when the chloroform itself crystallizes out, and can be separated from an impurity which remains liquid. Chloroform purified in this manner is a colorless liquid, having at 15° the sp. gr. 1.51. It is indefinitely permanent on exposure to light, while the so-called pure chloroform of commerce takes a greenish color if shaken up with solution of potassium dichromate and sulphuric acid. If Pictet's chloroform be similarly treated the chromic mixture retains its yellowish color.

NITRO-JUTE is a new explosive, invented by Mr. Otto Muhlhäuser. He treats one part by weight of jute fiber with 15 times its weight of a mixture of nitric and sulphuric acids. This product, which weighs about 30 per cent more than the original fiber,

takes fire at a temperature of 167 to 170 degrees C., and contains about 12 per cent of nitrogen. It is of a brownish-yellow color, and the composition is given by the author as $C_{12}H_{15}O_5(ON_2)$. It explodes by percussion like gun cotton, and is insoluble in water, ether, benzine or alcohol, but dissolves readily in acetic ether and nitro benzine.

ELECTRICITY.

Pumping Water to Operate Dynamos.

Prof. George Forbes, the great English authority on electrical transmission of power, in the Fourth Cantor lecture, recently delivered, mentioned a custom which prevails at Geneva, Switzerland, where the waters of the river Rhone are utilized in a unique way to generate electricity. Where the waters leave the lake the fall varies from 6 to 12 feet. To utilize this small fall, very large turbines had to be used. The plant consists of 20 of these, which pump water up to a reservoir three miles distant, which gave a large head. The water is then distributed in pipes throughout the town and supplies power direct to many of the industries, among which is the electric lighting company, which found it cheaper to rent their power from the existing company than to install a pumping plant of its own.

Consequently, there was presented the unusual arrangement of the electric lighting being done by turbines on the Rhone, pumping water to a reservoir several miles distant, the water coming back to within a short distance from whence it was pumped, and there driving turbines again which turned the dynamos that light the city. One would be inclined to think that such a method would be uneconomical even where water power was employed to do the pumping, and certainly out of the question if steam engines had to be employed, but Prof. Forbes says that as a matter of fact such an arrangement would be economical. He argued that when steam engines are used direct, a great deal of the value of the coal that is burnt is lost, first, because the engines are running light during a portion of the time, and second, because the boilers are consuming far more coal for the amount of work done than they would if the boilers were continually working.

It was his opinion that a case might arise where a decided economy might be effected where, instead of putting down a sufficient number of boilers and steam engines to supply the maximum current, a smaller number employed continuously in pumping the water to a given height would answer the purpose quite as well or better. In operating a station requiring a maximum of 1000 H. P., they did not require, on an average, more than a 150 H. P. In this particular case, they would have a steam plant of 150 H. P. working day and night, and from week to week, pumping up water into the reservoir; thus, instead of engines of 1000 H. P., those of 150 H. P. could be substituted at a great saving in capital outlay. The only offset to the increased cost of the larger plant would be the outlay for pipes to and from the reservoir, which, in the case cited, might amount to something like \$10,000.

He said that the saving would not only be material in the original outlay, but that there would be a considerable economy in the running expenses. An engine and boiler continuously pumping water would be working in the most economical manner. By this means it would be possible to obtain power with very little more expenditure than three pounds of coal per H. P., whereas in central stations they often went up to 10 or 15 pounds of coal per H. P. He had gone into the matter very carefully in the case of Edinburgh, and that he not only hoped to see the authorities there adopt it, but hoped that some such scheme would be adopted in other towns. In working out the scheme for Edinburgh, he said that if the water were first pumped to the reservoir by steam and then utilized as suggested, the capital outlay would be a little more than one-half that involved in a steam plant sufficient to do the work direct, besides there would be a saving in attendance and fuel.

SYNCHRONOUS MOTORS.—Great stress has often been laid on the idea that a very excellent quality of synchronous alternating motors lies in the fact that their speed must of necessity be exactly the same as that of the generator. While such a quality is undoubtedly a good one, it should also be remembered that it is attended by a serious disadvantage which constructors should bear in mind in designing the machinery for such systems. The fact is well known that if overloaded too much, such motors come

to a dead standstill; this, makers say, is not serious because if well constructed a motor should be able to stand an overloading of 100 per cent before the speed falls. According to a competent authority, there is another feature, however, which he claims is a great source of trouble in existing plants. He claims that if the speed of the engine varies, say it diminishes momentarily, then that of the generator will fall and as it rises again a moment later the motor, if it has a heavy armature, will not be able to follow as quickly as necessary, thus throwing the two out of synchronism. He claims that much of the trouble experienced with synchronous systems in use is due to this cause. In order to avoid this, it appears that the fly-wheel action of the armature of the generator should be as great as possible and that of the motor as small as possible, so that the former will tend to maintain an even speed and the latter will tend to respond quickly to any changes should they occur.

Electrical Engineers.

Said a prominent member of the American Institute of Electrical Engineers not long ago: "The developments in electrical science and practice come so rapidly that I despair of keeping up with them. A couple of years ago I considered myself fairly well posted as an electrical engineer, but my time has been taken up in other work since that time, and I feel now like an ignorant amateur in discussing electrical problems."

Certainly if electrical engineers find it difficult to keep abreast with the progress in their peculiar field, says the *Engineering News*, mechanical and civil engineers may be expected to abandon the task entirely. But while this may do for the older members of the profession, who have made their reputation in special lines and find abundant occupation in keeping up with the progress in their own specialties, every young engineer who aspires to something more than mediocrity, should gain all the information he can on the progress of electrical work.

It is not meant that the mechanical or civil engineer should abandon his special profession and take up electrical work, for the number of electrical engineers promises to increase faster than the demand for their services. It requires no great foresight to see, however, that with the constantly increasing part which electricity is playing in modern industry, the engineer who aspires to high rank in his profession ought to be familiar with the possibilities and limitations of electrical work. He should be able to judge for himself in cases where the relative advantages of electric and other motive power must be decided, not relying solely on the representations of possibly biased experts. The civil engineer asked to report on the value of a water power, the mining engineer giving an opinion on the cost of working a mine in a remote mountain district, the mechanical engineer planning the machinery of an extensive shop, all need to know what can be done with electricity in order to reach an intelligent decision.

UTILITIES OF SWITZERLAND'S WATER COURSES.—All the celebrated water courses of Switzerland are, one after another, being utilized for a force of energy. The river Aar is taken like the others. The canton of Berne has given a concession to Mr. Muller Landmann for the use of a waterfall at Wynau, aided by a canal 1000 metres in length, which gives a fall of 100 cubic metres per second, falling nearly four metres. The turbines will be constructed for a force of 3000 horse power destined for the industrial districts of central Switzerland and for the exploitation of an electric line. This force is only one-half greater than that given by the artificial falls of the Seine, up and down stream from Paris, at Port a l'Anglais and at Suresnes. We believe it will soon be used in valley. In that case we carry to the turbines 6000 horse power, which can easily be done, as the concession permits a fall of eight metres.—Translated for The Industrial World from *Electricite*, Paris.

HIGH-SPEED INTER-URBAN RAILWAYS.—C. Zipernowski, before the Electrical Congress, Frankfurt, proposes a line between Vienna and Buda-Pesth, a distance of 250 kilometres—say, 150 miles—and a speed of 150 miles per hour, which he considers the maximum the wheels will stand without danger of flying to pieces. The trains would consist of one carriage, seating forty passengers, carried on two bogies, with solid steel wheels eight feet in diameter, the driving power being four 200 horse-power motors, working at 1000 volts, which necessitates collecting, therefore, by contact from a center raised rail, some 600 amperes. The up and down lines must be about ten metres apart, to avoid the shock of air, when two

carriages pass, blowing them off the rails. There must be no curves of less radius than 3000 metres—say, 1.8 miles—and for these the outer rail must be raised fifteen centimetres (six inches). The power would be supplied from two stations, at 10,000 volts alternating, which would either be transformed down or redressed to direct current, at 1000 volts.

USEFUL INFORMATION.

PERSONAL SAFETY.—Francis B. Crocker and A. S. Wheeler are writing a series of articles (published in the *Electrical Engineer*) on "The Practical Management of Dynamos and Motors." On the subject of personal safety, they say: "Never close a circuit through the body. An accidental contact may be made through the feet, hands, knees, or other part of the body in some peculiar and unexpected manner. For example, men have been killed because they were sitting on a conducting body. Rubber gloves or rubber shoes, or both, should be used in handling circuits over 500 volts. The safest plan is not to touch any conductor while the current is on, and it should be remembered that the current may be present when not expected, due to an accidental contact with some other wire or a change of connections. Tools with insulated handles or a dry stick of wood should be used instead of the bare hand. The rule to use *only one hand* when handling dangerous electrical conductors or apparatus is a very good one, because it avoids the chance, which is very great, of making contacts with both hands and getting the full current right through the body. This rule is often made still more definite by saying, 'Keep one hand in the pocket,' in order to make sure not to use it. The above precautions are often totally disregarded, particularly by those who have become careless by familiarity with dangerous currents. The result of this has been that almost all the persons accidentally killed by electricity have been experienced electric linemen or station men."

FLOOR CONSTRUCTION.—It seems that Herr Wulff, the inspector of buildings in Hamburg, Germany, says the *Manufacturers Gazette*, has recently taken considerable interest in the matter of floor construction, and some experiments made by him have a tendency to demonstrate that the various materials introduced between, with a view to increasing their resistance against fire, are practically useless, and that the foul smoke caused by their burning may be injurious. He prepared 11 pieces of flooring, each about five feet square, which were successfully placed on four posts, under an iron roof, and covered with inflammable materials. These materials were then ignited and kept burning until the sample floor was burned through. As the result of these experiments it was ascertained that a floor of two thicknesses of 1.5-inch boards joined at right angles was burned through in one hour and 22 minutes. The same construction with asbestos paper between the flooring burned in 59 minutes, and with the ordinary roofing felt the flooring burned in one hour and 12 minutes.

ASBESTOS CEMENT.—A factory for the manufacture of King's Asbestos Windsor cement has recently been established at Savannah, Ga., that will confine its operations to the higher grades required for plastering walls and ceilings. It is a dry mortar finish and is beautiful in appearance. It is elastic, and consequently does not crack like the ordinary lime plaster. Asbestos is fire-proof, as everybody knows; this is another advantage of this excellent plaster. It is also proof against vermin and germs of every nature. It contains no acid and does not discolor. Frequent tests have demonstrated the fact that walls plastered with this cement will not fall, a guarantee of satisfaction to every landlord. The factory will have a capacity of thirty tons daily, and is controlled by A. Hanley.—*Savannah News*.

SUBSTITUTE FOR A SPLIT-PIN.—An interesting device to be used as a substitute for a split-pin is described in *Invention* (London). Instead of boring a hole through the end of a bolt for the insertion of a split-pin to hold the bolt in place, an annular recess is turned in the bolt, the inner shoulder of which is flush with the surface of the piece through which the bolt is inserted. A conical ring, with a spring temper, cut through on one side, is then slipped over the protruding end of the bolt into the recess until it snaps into the recess, the base of the ring resting against the surface of the piece through which the bolt is inserted and outside of the diameter of the bolt. The drawings accompanying the

description referred to show that a very neat finish may be made in this way, and it seems a highly practical method of fastening bolts or locking nuts in place.

THE WATCH AS A COMPASS.—It may not be known to many, says *Iron*, that the points of the compass can be determined with the aid of an ordinary watch. It is simply necessary to bring the watch in a position so that the hour hand is directed toward the sun. The south then lies exactly midway between whatever hour it may happen to be and the numeral XII on the dial. Let us suppose, for instance, that it is four o'clock, and that the timepiece is held in the position indicated. The direction of the numeral II will then be the exact south. If it be eight o'clock, the numeral X will indicate the exact southerly point.

STRENGTH OF STRONG MEN.—A French experimenter has tested the strength of 50 robust men and 50 healthy women, all of the middle class of society and between 25 and 45 years of age. The strongest man was able to give with the right hand a pressure equivalent to 187 pounds, and to the weakest one of 88 pounds. The short men were nearly as strong as the tall, the average difference being less than seven pounds. The force exerted by the strongest woman was only 97 pounds, and that by the weakest was but 35 pounds, while the average was 72 pounds.

GOOD MEALTH.

OVEREATING VS. OVERWORK.—An abuse that tends to the injury of brain workers is excessive eating. I recall to mind several active brain workers who suddenly broke down, and fancied that it was due to brain fatigue, when, as a matter of fact, it was due to overstuffing of their stomachs. The furnace connected with mental machinery became clogged up with ashes and carbon in various shapes and forms, and as a result disease came, and before the cases were fully appreciated, a demoralized condition of the nervous system was manifested, and they laid the flattering unction to their souls that they had indulged in mental overwork. Hard work, mental or physical, rarely ever kills. If a mild amount of physical exercise be taken, and a judicious amount of food be furnished, the bowels kept open in the proper manner, the surface protected with proper clothing, and the individual cultivates a philosophical nature and absolutely resolves to permit nothing to annoy or fret him, the chances are that he can do an almost unlimited amount of work for an indefinite length of time, bearing in mind always that when weariness comes, he must rest, and not take stimulants and work upon false capital. The tired, worn-out slave should not be scourged to additional labor. Under such stimulus, the slave may do the task, but he soon becomes crippled and unfit for work. The secret of successful work lies in the direction of selecting good, nutritious, digestible food, taken in proper quantities, the adopting of regular methods of work, the rule of resting when pronounced fatigue presents itself, determining absolutely not to permit friction, worry, or fretting to enter into his life, and the cultivation of the Christian graces, charity, patience, and philosophy.—*Medical Mirror*.

CAN DISEASES BE COMMUNICATED BY THE TELEPHONE?—The danger of a possible communication of infectious diseases by the medium of the telephone has recently been exercising the minds of the postal authorities in the Pomeranian city of Danzig, who ordered a scientific investigation of the subject. The results of the inquiry have now been officially made public, and they are, on the whole, of a reassuring nature. The exhaled air which comes in contact with the instrument every time it is used is proved to be germ-free. Should, therefore, any particles, which may be on the telephone plate, be communicated to persons using the telephone, this cannot occur through the simple breathing of air, but only under certain conditions; namely, if particles ejected by diseased, especially consumptive, persons alight by chance on the microphone and there dry in. But even this contingency is easily obviated, if the settlement of dust in the apparatus be prevented by frequent wiping with a damp cloth. The risk of taking disease by infection through the use of the telephone must then be regarded as very slight, especially as we have it on scientific authority, that it has never actually been established that where a person who was in the habit of using the instrument had contracted a contagious disease, this was communicated by the medium of the telephone.

The Miners Need Funds.

The California Miners' Association is anxious to keep its delegates at Washington until some final action by Congress regarding the Debris bill. In the time they have been there they have accomplished a great deal, but more remains to be done. A favorable report from the Mining Committee has been made on the bill appropriating \$450,000 for the construction of debris dams, which is a very encouraging thing. But for the presence of the miners' delegation, and their energetic work, this would not have been accomplished. Having gained this point of vantage, the committee has now turned to impressing the members of the House and Senate with the justice and reasonableness of the State's demand. In order that the necessary missionary work may be done before the question comes up for debate, in order that the arguments of our representatives in Congress may fall upon ears ready and willing to listen—in short, in order that all that has been thus far accomplished shall not be lost, and that some practical relief may be obtained at this session of Congress, the continued presence of this committee at Washington for some time longer is an absolute necessity.

The expenses of the committee of gentle-

men engaged in a work of this magnitude must necessarily be considerable. While some of the counties most directly affected by the proposed legislation have responded liberally in the matter of furnishing funds, the merchants of San Francisco, who are affected in only a less degree than the miners and farmers themselves, have been lukewarm. This has been due, not to a want of good-will, but to lack of advice as to what has been accomplished and as to the necessity of liberal contributions in order to push to a successful termination the fight still before us.

An appeal has been made to the merchants of San Francisco by the Miners' Association in which the above ideas are embodied. They are asked to contribute as liberally as possible, and the miners promise to publish an itemized account of the expenditure of the money so contributed, so that it will be seen that none is wasted.

It is to be hoped that a prompt response will be made to this appeal, and that the merchants of San Francisco will lend the necessary pecuniary aid to the movement. The funds of the Miners' Association are low, and it is undesirable to recall even one of the delegates at Congress. This city will benefit largely by a resumption of hydraulic mining on the basis proposed, and its citizens can afford to extend liberal help to those who bring the result about.

The Present Price and Future Status of Silver.

What was long since foreseen has at length come to pass. The warfare commenced in this country on silver is beginning now to yield its legitimate fruits. Exhausted by the protracted struggle to keep their works going, many of the larger producers of the white metal on this coast are yielding to the inevitable and retiring from the business. One after another our big silver mines are being closed down. Commencing only a few weeks since, nearly a dozen of the leading companies have already suspended operations. Many of the large concerns at Butte, Montana, have put out their fires, hung up their stamps, and ceased ore extraction. And now comes the news that the Waterloo Company at Daggett, in the Calico district, and the largest silver producer in this State, has in like manner suspended operations, with the probability that other companies in that vicinity will shortly follow suit. The Aspen Cons. mine, at Aspen, Colo., and several other silver mines at Telluride, also closed this week, throwing 1000 men out of work.

And thus there has been made a good beginning of what threatens to become a widespread suspension of silver mining throughout the regions lying adjacent to and west of the Rocky mountains, whence comes more than two-thirds of the entire silver product of the world.

And what, should it happen, does the occurrence of such an event mean? Have our legislators, publicists and financiers any just conception of what it implies, or have they ever stopped to contemplate the subject in this new light? First, there is to be considered the thousands and tens of thousands of working men that, should this industry be stopped or largely intermitted, will be thrown out of employment, and this under circumstances of peculiar hardship. The business of silver mining is carried on for the most part in remote and barren sections of country, where, apart from this, there are no other large industries to give employment to labor. Deprived of work in these far-off places, these men, many of whom have families to support, will be rendered utterly helpless, being without opportunity to earn a living where they are or means to take them to localities where they can do so. The distress that must ensue from this condition of things can be more easily imagined than described.

Next, there is to be considered the loss of capital that a general cessation of silver

mining will involve. What this would amount to is simply incalculable, the sum invested in this business reaching far into the hundreds of millions. Not only will this large sum cease to make earnings, but the owners of these mines, unless their total abandonment is contemplated, will have to pay out money continually to keep them in repair. The underground works, if suffered to fill with water, will soon become irretrievably ruined, and the entire plant, if neglected, hasten to decay.

How imminent is the danger of a general shutting down of our silver mines becomes apparent when we reflect that the companies which have already done so were every one of them well situated for continuing the business, which they no doubt would have done could it have been continued with profit, or even without a positive loss. The mines about Butte which carry large bodies of fair-grade ore, are well developed and outfitted. Water and timber are abundant in the neighborhood, while railroads lead into the district from every quarter, the conditions prevailing at the Waterloo mines, in this State, all things considered, being no less favorable.

Intervening between the Calico and the Butte districts are portions of Idaho, Utah and Nevada, all large silver-producing countries. That we shall, before long, hear of companies there, following the example of their neighbors on both the north and the south, may well be expected.

In a conversation just had with Simeon Wenhan, probably the largest individual producer of silver in the world, he expressed the belief that such result was sure to happen, remarking that he would have closed his mines in the Cortez district, State of Nevada, some months ago but for his unwillingness to throw the large number of men in his service there out of employment.

These Cortez mines have to date turned out silver values aggregating over six million dollars, their present yield amounting to \$600,000 per year. While there exists here no special need for economizing the ore, so large is the stock already developed or presumably in store, still the owner of this property feels that he is committing a sort of waste in working on a profit-margin so comparatively small. Yet he prefers suffering such constructive loss to shutting down his mines and thereby casting these poor people adrift on the desert, few of them able to long subsist on their accumulated earnings and none knowing where to go, with any certainty of getting employment.

Not always, however, are the producers of silver actuated by such humane motive, or if they are, few of them can afford to gratify the same at the expense of their pockets. In most cases, therefore, where the business shall cease to prove remunerative, its early abandonment must be looked for.

Few men have studied this silver problem with greater care or by more intelligent methods than the owner of these Cortez mines, his deep interest in this question having compelled him to look into and carefully consider it in all its aspects and bearings. When, therefore, he expresses the opinion that our Government might, with safety, adopt the free coinage of silver, and that it should at once proceed to do so, such opinion is entitled to respectful consideration, to say the least.

Simeon Wenhan, though a native of England, whence he came to the United States in early boyhood, is enough of an American to believe that in dealing with this silver question, as well as with many others of national import, this country can afford to disregard the conditions and usages that obtain in the Old World, and in all things adopt such policy as our best interests may seem to dictate.

Making frequent visits to his early home, some of which are extended to Continental Europe, Wenhan is conversant not only

with the monetary systems in vogue there but also with the commanding influence everywhere exerted by the United States in these and, indeed, in matters of almost every kind. In affairs social, fiscal and industrial, the greatest respect is had for examples set them on this side, and should our Government lead off on this free coinage question, it would not be long till we would have all Europe for a following.

The fear of any hurtful influx of silver as likely to result from the adoption by us of such measure is, by our informant, considered altogether chimerical, for the reason that these peoples abroad would need to retain all the silver they have for home use, and this whether they remonetized the white metal or not. Not only so, but they would have to draw largely from us to keep up their stock, as they produce very little silver themselves. As to dumping their silver on our mints, and with the proceeds buying gold and shipping it away, that, too, is a delusion. Should this be attempted, depositors would get in return for their bullion only silver coin or silver certificates, which in buying gold could only be used at the current discount. And thus, while our mints would get their seigniorage for coining this silver, the depositors would gain no advantage, to say nothing of the costs incident to shipping it across the ocean. So confident is Mr. Wenhan that Congress will rehabilitate the white metal, and thus cause it to appreciate in value, that he has not for the past four months sold an ounce of silver, holding the entire output of his mines for such expected improvement in the market.

But speculate and argue as we may, one thing is certain: This silver business has reached a stage that calls for vigorous and determinate action. The day for temporizing is past, nor will it do to dilly-dally any longer. With our great silver mines closing down, and this entire interest threatened with a deadly peril something positive will have to be done, and that speedily. If we cannot arrest this degradation of silver, let it be relegated to the domain of the base metals and have done with it. If no plan can be devised whereby its full money function can be restored to it, and afterward maintained, then let it be proclaimed a mere commodity to be sold like lead, copper and iron for what it is worth on the markets of the world. This done, and its status will be so fixed hereafter that all will know what to expect and how to regard it.

The doctrine lately announced by Leland Stanford in the United States Senate, that every dollar issued by this Government, whether gold, silver or paper, should be maintained at a parity, is the right one. No form of money bearing the stamp of this Government should be discredited, least of all by any Act of the Government itself. Let us try the free coinage of silver and see what it will do toward the accomplishment of that end. This policy worked well in the past, and there can be no good reason why it would not work well again. Never before the white metal was so devalued did its price drop as low as that ruling at present, nor was a gold dollar ever then worth any more than one made of silver, the disparity now existing between them being wholly due to the demonetization of the latter.

Never since that stupendous blunder was committed were conditions more favorable than now for adopting measures looking to its correction. The times are auspicious for a movement of that kind. The whole financial world is alive to the importance of this silver question. When last year Commissioner Seligman, sent by our Government to Europe to consult with the moneyed magnates there on the subject of convening an International Congress for the purpose of establishing by general consent the relative value of gold and silver, and, further, to gather their views in regard to restoring silver to its former standing in the monometallic nations of Europe, our commissioner was not only well received, but found the most of these people ready to further, by all means in their power, the objects of his visit. There prevails, in fact, among the manufacturers, merchants and business men of the Old World a strong sentiment in favor of bimetalism, the opposition to this policy being confined largely to theorists and money lenders. The recent utterances of Mr. Goschen, the English Obancellor of the Exchequer, sufficiently denote how widespread this sentiment has become in both the financial and the Government circles of Great Britain.

Sorting and Handling Coal.

In last week's PRESS, a sectional-view was given of the Iron Breaker at Drifton, and this week, a view is presented showing the end elevation of the breaker, jig-house and pockets. This structure is a somewhat remarkable one, owing to the care given to the general features as well as to the details of construction and operation. As an adjunct to a large coal mine, intended to prepare the coals for the market, these details are of interest to coal miners. Some of the apparatus is used simply for changing the

Where an abrupt change in the direction of the chute becomes necessary, we often use cast iron turns, which are spiral, half-round troughs of greater or less length. One large one of this kind, *D*₁ (see engraving) is used for carrying the lump coal from the platform *F* to the lump coal chute. It is a spiral, the center of which is always 16 feet from a vertical axis. The chute is 4 feet wide inside and the section is half an ellipse. The slate conveyor *N* carries away all the refuse that does not float off with the water. There is a double drag *M*₂ that carries the screenings from the loading lips

The end elevation of the breaker, with jig-house and pockets, is shown in the cut. The numbered parts (which correspond with those shown in the cut in last week's PRESS), are as follows:

The side elevation of the breaker is shown in the plate. The numbered parts are as follows: 2, built up I-beam carrying dump; 4, taper built-up girder, forming sides of mud-screen pocket *H*, and carrying dump chute and bars; 5, built-up I-beam carrying platform *F*; 7, inside girder carrying sheaves; 9, fifteen-inch I-beam carrying mud-screen *S*₁; 11, 24-inch I-beam carrying

drainings, slate and slimes; 39, vertical line shaft; 41, platform for slate drawer; 59, scraper chain of jigged coal.

The Astronomical Society.

The Astronomical Society of the Pacific held its annual meeting on Saturday evening last, when a large number of members were elected.

A new board of directors was elected, as follows: William Alvord, Charles B. Hill, W. W. Campbell, Otto von Guldern, E. S. Holden, Camilo Martin, E. J. Molera, Wil-

END ELEVATION OF BREAKER, JIG-HOUSE AND POCKETS, SHOWING DETAILS OF CHUTES, ETC.

position of the coal without making any mention of its preparation. It consists of chutes, elevators, drags and loading lips. The chutes are used for conveying the coal or slate from one portion of the breaker to another, the stuff sliding down by gravity. In this breaker they are constructed, as a rule, of sheet-iron, and are generally half-round troughs; the size, inclination and thickness of the iron depending upon the work to be performed; the larger the coal the heavier the iron, and the smaller the coal the lighter the iron and the greater the pitch of the chute. Some of the chutes are flat instead of half-round, and are formed of sheets of steel plate, with steel sides. These are generally used where it is important to inspect the coal. There are a number of local causes that may cause a round or square chute to be preferred in special cases.

into a car *X* under the breaker, which is hoisted to the top of the breaker.

The pockets for the prepared sizes of coal are eight in number. They are 38½ feet long, 11½ feet wide, 3½ feet deep at the upper end and 15½ feet deep at the lower end. The bottoms of these pockets, which are made of cast iron plates, are supported on beams (25 and 26) running parallel to the longer axis of the pocket, and on a pitch of four inches to the foot. They are supported at four points by iron beams, three of which are between posts, and the fourth (28), running the whole length of the pockets, supported by a truss as shown. The lump coal chute *P* consists of a pin-connected truss structure, with two chutes, the upper one *P*₁ for steamboat coal, and the lower one *P*₂ for lump coal. The general construction is shown in the cut. Loading chutes are arranged at the bottom.

driving mechanism of jigs, also screens *S* and *S*₁; 12, fifteen-inch I-beam carrying timbers under wet-screen; 14, twenty-four-inch I-beam carrying east end of jig tanks; 15, I-beam carrying broken-coal screens *S*₂; 16, fifteen-inch I-beam; 17, twenty-four-inch built-up I-beam under deep end of pockets; 18, eight-foot sheaves nearest to hoisting engines, north side; 19, line shaft from Westinghouse engine for driving jigs; 20, line shaft for driving drags taking coal from jigs; 21, pulley from which gyrating separator *K*₁ is driven; 24, slate chute under jigs; 25, built up I beam under pockets; 26, rolled beam at shallow end of pockets; 28, built up beam under 26; 29, slate drag trough under jigs; 30, screenings-hopper above *T*₁; 33, trap door over steamboat rolls, *G*₂; 34, twelve-inch timber carrying jig tanks; 35, lattice-girder for jig-house; 36, beam carrying *S*₂; 38, chute floor for jig

liam M. Pierson, J. M. Schaeherle, Frank Soule, F. R. Ziel.

Publication Committee.—W. W. Campbell, E. S. Holden, Charles G. Yale of the MINING AND SCIENTIFIC PRESS.

After election the board went into executive session, which resulted in the choice of the following-named officers for the usual term of one year:

J. M. Schaeherle, president; E. J. Molers, first vice-president; Frank Soule, second vice-president; Otto von Guldern, third vice-president; F. R. Ziel, secretary and treasurer.

Steps are to be taken to build an observatory in this city. Andrew Carnegie of Pittsburgh, who has been elected a life-member of the society, will give material financial aid in this direction, and a committee is to solicit subscriptions toward putting up a first-class observatory.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

TEN WEEK ENDING MARCH 22, 1892.

- 471,508.—PAPER WEIGHT.—Chas. Dickinson, Portland, Or.
 471,325.—CASH AND PACKAGE CARRIER.—Julius Finck, S. F.
 471,477.—GUN-CLEANING DEVICE.—Geo. H. Garrison, Kent, Wash.
 471,335.—VALVE GEAR.—Heintzelman & Noyes, Sacramento, Cal.
 471,326.—INSERTIBLE SAW BIT.—M. A. Howe, S. F.
 471,327.—BAR FIXTURE.—Lefebvre & Cessna, Redding, Cal.
 471,483.—POCKET SAVINGS BANK.—L. U. Loomis, Tacoma, Wash.
 471,487.—HONEY EXTRACTOR.—C. W. Melcalf, Santa Paula, Cal.
 471,131.—CURRN.—Rebecca E. Miles, Porterville, Cal.
 471,222.—ATTACHMENT FOR RANGES.—John F. Myers, S. F.
 471,359.—CHECK ON ORDER BOOK.—Edward North, Newhall, Cal.
 471,258.—ORE CONCENTRATOR.—J. M. Thompson, S. F.
 471,319.—CONCENTRATOR.—Jas. Tulloch, Angels, Cal.

The following brief list by telegraph, for March 29 will appear more complete on receipt of mail advices.

- California.—James A. Christy and E. J. Baldwin, San Francisco, telephone receiver; Milton A. Clemen, San Francisco, connecting rod, joint and bearing; William B. Flynn, San Francisco, car brake; James B. Freeman, Los Angeles, machine for separating gold, silver, etc.; James Gallagher, Oakland, electric light crane; George L. Goodman, San Francisco, prescription file; Edward E. Park, San Francisco, dental disk holder; Mark A. Penny, Perry's, brake shoe; George A. Richardson, Latrobe, level square; Luther H. Steffy, San Diego, adjustable head section for beds; Gerhard L. Thunen, Oroville, safety attachment for gas burners; Ada H. Vanpelt, Oakland, house-door letter box; Charles A. Warren, San Francisco, excavator; California Automatic Interchangeable Car-Coupling Co., car-coupling; James B. Williams, Oakland, insulated electric conductor (2); Ozzie H. Burnham, Oakland, and J. J. Meyers, San Francisco, refrigerator; Oregon.—Dan C. Turner, Roseburg, plow; Washington.—Isaac Burlington, Fremont, indicator for sawmill cuttings; Austin E. Miller, Sprague, tri-cycle; William B. Morris, Seattle, stump puller; Andrew Wren, Seattle, snatch block.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible by mail for telegraph order. American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

BAR FIXTURE.—J. J. Lefebvre and J. O. Cessna, Redding, Shasta Co. No. 471,327. Dated March 22, 1892. The object of this invention is to provide a bar fixture for keeping cool conveniently, holding and permitting the ready manipulation and cleaning of the several bottles, vessels, pipes, etc., in which the liquids are contained. This whole device is intended to be located under the counter of the bar and is therefore in convenient position. From certain cocks and faucets the barkeeper can draw cold water or cold beer. He can reach his several bottles conveniently, and their contents are kept cool by the cold air in the cooling box. His drip-sinks, drip-racks and rinse-sinks are all conveniently located and have proper discharges, and all parts are adapted to be readily removed and replaced.

INSERTIBLE SAW BIT.—Merrill A. Howe, S. F. No. 471,326. Dated March 22, 1892. This consists of a bit, the holding extension of which and the segment by which it is engaged and held are fitted into the throat of the tooth opening in the saw plate upon the arcs of two intersecting circles, and in conjunction with this of certain holding-lugs whereby the bit and the segment are prevented from shifting their positions.

CASH AND PACKAGE CARRIER.—Julius Finck, S. F. No. 471,325. Dated March 22, 1892. This invention relates to that class of cash and package carriers for store service in which a basket is suspended from a car mounted upon an overhead track and adapted to be propelled by separating the track wire. In this class of devices, when the basket or receptacle is attached and lowered from the car, it often happens that by mistake a salesman, before said basket is again attached, will pull upon the lever whereby the track is raised, and will thereby start the car off without the basket. The object of this invention is to prevent this by providing an automatic locking attachment which will retain the car in place when the basket is detached by preventing the lever from raising the track, and will allow the lever to act again only when the basket is attached to the car.

BACK FILES OF THE MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

 Telephone No. 1744. SAN FRANCISCO, CAL.

California Mineral Lands.

MURPHYS, Cal., March 23, 1892.

TO THE EDITOR:—In an article by Mr. A. B. Paul which appeared in the MINING AND SCIENTIFIC PRESS recently, that gentleman claimed that the Miners' Association had neglected the quartz miner in its zeal to serve the hydraulic. I presume the majority of your readers agreed with you in your reply that Mr. Paul was simply mistaken, but I know that the Association has a still larger contract on its hands if it would give the quartz miner the same measure of assistance that is now being so liberally and effectually put forth in behalf of the long-suffering and persecuted hydraulic miner. Mr. Field has lately stated how he will rule in regard to mineral lands claimed by the railroad companies, and these same companies have shown their belief in his ability and willingness to so decide, by sending their agents throughout every mineral-bearing section traversed by their lines to rate these lands; and it is this well-known fact that has caused Mr. Paul and every miner in those sections to feel that unless prompt and decisive action is taken the miner will be compelled to either rebuy his lands from the railroad companies at the values which he has made by his own labor and expense, or see his property wrested from him. Now, if ever, is the time to strike and to strike so effectually that the (in)justice of 100 Fields cannot undo it. Another matter that could be pushed to advantage at the present time is to imitate the example of the Colorado representative, who has introduced a bill to the effect that all monies derived from the sale of mineral lands in Colorado shall be paid to and for the Colorado State Mining College. Colorado has ever looked after her mineral interests and though young in years is fast advancing to the front. We of California have asked, What for our mines? Nothing! The oldest and greatest mining State in the Union and she has no mining college, and begrudges the yearly allowance to her State Mining Bureau. Let us, too, have a mining college, and in the interval pay the money from the sales of mineral lands over to our State Mining Bureau. Colorado will assist, and every other mining State, in the passage of the bill, and now that the mining interests have, at last, a representative in Congress in Mr. Caminetti, who knows what we want, and knowing it, does not hesitate to ask nor fail to work for it, there would not be that indifference, if not opposition, that has met every measure introduced for the benefit of the miners in the past.

E. H. SCHAEFFLE.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents. If ordered soon enough. If already a subscriber please show the paper to others.

SOME time this month about 100 tons of Hale & Norcross ore will be worked at the Occidental mill to see how high a percentage of the precious metals can be obtained by the process used there.

MOTIVE HERCULES Gas and Gasoline POWER ENGINES

Have fewer parts, and are therefore less likely to get out of order than any other gas or gasoline engines now built. Just light the burner, turn the wheel, and it runs all day.

MAKES NO SMELL OR DIRT.

No double or false explosions, no frequent with the unreliable spark,

For Simplicity it Beats the World.

It Oils itself Automatically,

No Batteries or Electric Spark.

It runs with a Cheaper Grade of Gasoline than any other Engine.

DIVIDEND NOTICE.

OFFICE OF THE PACIFIC COAST BORAX COMPANY, San Francisco, March 31, 1892. At a meeting of the Board of Directors of the above-named Company, held this day, a Dividend (No. 16) of One Dollar (\$1.00) per share was declared, payable MONDAY, April 11, 1892, at the office of the company, No. 230 Montgomery St., Rooms 11 and 12. Transfer books will close April 8, 1892, at 3 o'clock, P. M.

ALTON H. CLOUGH, Secretary.

AN ASBESTOS MINE FOR SALE.—The mine is located near Forest City, Sierra County, California. Ledge two feet wide. Croppings traced 2000 feet. For particulars, inquire of the undersigned at Forest City. B. F. DEACKSON.

Assessment Notices.

KEYSTONE CONSOLIDATED MINING COMPANY.
 Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Wednesday, the 9th day of March, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 310 Pine St., room 43, San Francisco, California.
 Any stock upon which this assessment shall remain unpaid on the 15th day of April, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 9th day of May, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.
 By order of the Board of Directors
 J. H. ISHAM, Secretary.
 Office, No. 310 Pine St., Room 43, San Francisco, Cal.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, March 31, 1892.

Rains the past week in the valleys and snow on the mountain ranges were welcomed by the trade in general as emphasizing the encouraging outlook for a prosperous season. If Congress would encourage hydraulic mining in this State and still further protect the silver mining industry, all agree that this year would be the most prosperous in the history of the State. Iron workers are outspoken in this belief. The local money market continues easy, as do Eastern money markets. European money centers are reported more or less feverish, with time only able to restore confidence. Referring to the general situation the *Chicago Drovers' Journal* editorial says that these two opposite agencies of influences are beginning to be felt in the business world, one working in the direction of higher prices and heavier demand, and the other in the direction of lower prices and a continuation of restricted dealings. The cause for the first agency is the natural growth of business; the cause for the second is the restricted facilities for doing business. At no time has there been as much curbed enterprise as to-day. In every department of activity there are schemes and projects by the score waiting the right time to be sprung. There is a conviction in the minds of a great many shrewd business men that there is an insufficient supply of money to float more than a very small percentage of these new enterprises. The expanding demand which is being felt can be very quickly supplied, not from stocks in hand, as stocks are light, but from current production which is at its maximum point in many directions.

Eastern advices report a decided falling off in exports, owing to a fall in the price of breadstuffs abroad. Referring to the lessened outward movement, the *New York Mail and Express* says: "The export movement culminated in December, when the total of \$19,935,896 was reached, and for three months in succession the best record was broken. The total for January was \$100,381,336, which was large enough, and for February \$86,638,097. This is quite a falling off as compared with previous months, but it is almost twelve millions in excess of the total for the same month last year, which was then the largest on record, for the month. For the 12 months the total runs only \$220,229 short of around \$1,000,000,000."

QUICKSILVER—Receipts the past week aggregate 200 flasks. The market is dull but steady.

MEXICAN DOLLARS—The market is stagnant at around 68 cts. Dealers do not appear to have much faith in silver recovering much of the decline made the past week.

SILVER—On last Monday the Eastern and foreign markets made quite a bad break, sending prices to lower figures than known in the history of trade. The break is accepted by those in position to know, to be due entirely to manipulation, and by them it is claimed that the markets do not appear to have settled for another sharp decline is liable to set in before long. Silver, as a commodity, offers a fine gamble to large moneyed pools. Not only can silver be successfully manipulated but securities having their market value hinged largely on the market price of silver, can also be advantageously dealt in. Who the prime movers in the present manipulation of silver are, outside of those given in last week's *PRESS*, we do not know, neither do we claim to know how it is to be manipulated, yet the market has the earmarks of a rapid recovery and good prices after the syndicate or pool have accomplished their object on the down move. The stock of silver bullion at the East is given at a little over 3,000,000 ounces, and as the production is largely curtailed the Mint purchasers will soon absorb the available stock. Besides this, England will be a large buyer before 60 days pass, for that country has been slow in settling with India, and the result is that on March 15th the silver balance was \$1,500,000 in favor of India as compared with an adverse balance nine months ago of \$7,000,000, and the balance this year in favor of India is steadily increasing under heavy exports by the latter.

BORAX—Receipts the past week aggregate 448 cts. The market is fairly steady.

LIME—Receipts the past week aggregate 8742 bbls. The receipts come chiefly by water. The Hawaiian Islands continue to be large purchasers. The home demand is quite free.

ANTIMONY—The market is steadier, in sympathy with the East. New York mail advices quote as follows: 10% @ 11c for Hallett's; 12% @ 14c for LX; and 14% @ 15c for Cook's, in wholesale quantities.

LEAD—The market is in buyers' favor. At the East, sales are reported of 1500 tons at around 4.10 cts. Since then, the price was advanced to 4.15 cts.

TIN—Pig is scarce and higher. Plates are unchanged. Canners are using up large quantities, but they supplied their wants some time ago. London cables report plates easier under an offish demand.

PIG IRON—The market is essentially unchanged. While the foundries and iron workers in general report fair degree of activity in their lines, yet they claim that it would be largely increased if the Government would aid hydraulic mining. London cables report a higher market. Eastern mail advices report a slightly better tone, yet no advance is looked for, owing to the heavy output and the low cost at which Southern can be turned out.

COPPER—The market is fairly steady. While there is a general belief that a combine has been organized at the East and abroad, yet no particulars can be secured. London cables to the *Iron Age*, March 24th, report as follows: "The copper market has been excited and strong, and prices have advanced about 1/2. Various rumors regarding the alleged producers' combine have kept a lively interest in the market, and strong American advices have also tended to stimulate speculation, while the reduction of over 1438 tons in European stocks during the first half of the month has tended to increase confidence. Consumptive demand improved considerably during the past week, particularly for electrical supplies. Another block of 7000 tons Anaconda matte has been sold for delivery over five

months, price to be regulated by selling price of merchant bars in the London market."

COKE—The market is lower under heavy spot supplies. After these are cared for, better prices are looked for.

COAL—Imports the past week aggregate as follows: Tacoma 8200 tons, Seattle 2018, Departure Bay 1435, Nanaimo 7312, Baltimore 4250; total 23,215 tons. The market does not present any material change for either spot, to arrive or for shipment. The consumption is fair, with the outlook favorable for a large increased demand to set in next May.

Mining Share Market.

SAN FRANCISCO, March 31, 1892.

The market has been featureless the past week, with fluctuations not wide enough to allow even that king of choppers, Lipman, to make a profitable turn. While the action of the market is an enigma to the many, yet it strengthens the conviction among a few shrewd operators that a sharp up-move is near at hand, and that while prices may shade off slightly first, still those who have stocks and are quick about it can sell at a good profit when the advance comes. The up-move will quite likely be like the jumps since the month of May in 1891, made to make the small shorts fill and not of long enough duration to let outsiders unload on the manipulators. It is an undeniable fact that stocks are scarce among commission brokers, for the majority of buyers pay cash; but this very fact is accepted as *prima facie* evidence that the stock pool is playing for a sharp upheaval. All previous deals have been made with large lines of stocks held by brokers so as to induce shorting, and it is only on the shorts that a successful deal can be made these days when insiders get the bullion and outsiders get left with assessments. By making stocks scarce, it is evidently the intention to induce outsiders to buy with the expectation of a deal being near at hand. Bullion and assessments are good enough for a while, but the market is making the making active and higher prices for mining shares. If brokers work more in harmony, then the rings will have their rearranged little game spoiled and he forced into the market as buyers so as to control the mines at their respective annual election. The Brokers' Combine forced the reported rings to contest for the control of three mines this year, and consequently higher prices were obtained for shares, but after securing the mines, then the market fell back into its old rut. Within the next three months, several mining companies will hold annual elections; and if sell out brokers and brokers who worship the "golden calf" will lay low and neither say nor do anything, we may witness better times than have been seen for many years.

It looks very much as if some person or persons are trying to buy the San Francisco Stock Exchange building at a low figure, and to facilitate the sale they bring influences to bear on certain brokers to give their proxies for shares in their name to reported insiders to secure control of the mines. Why don't the brokers try a change? The market certainly cannot be made any worse.

It looks very much as if Sam Jones' extra effort in repitting the finding of ore in several of the Gold Hill mines made him sick, for this week the official letters are fathered by Gorham, and as usual, it is water and porphyry. These letters, of course, are for outsiders; private advices are not obtainable.

Insiders are evidently having circulated the report that when John W. Mackay arrives, which will probably be about the middle of April, we are to have a big up market. If this should prove to be the case, it will be different from previous actions of the market after Mr. Mackay arrived. For several years past, his presence has acted like a "wet blanket" on the market, for prices went down instead of up.

Al Havens, the popular Secretary of the Con. Virginia M. Co., has returned to the city looking the picture of health. He is loud in his praise of the Keeley bichloride of gold treatment, claiming for it the eighth wonder of the world. If Mr. Keeley can inject some honesty in mine managers, he can cure a sick stock market, which would take precedence over the other wonders of the world.

The suit of M. W. Fox against the Ha'e & Norcross directors and Nevada Mill & Mining Co. will probably go to Judge Hubbard today or tomorrow. At the public hearing the defense took about one week to tell, it is said, what he did not know. While he was speaking, the Comstock mills were turning out bullion.

News from outside mining districts continues uniformly favorable from the Quijota and Tuscarora districts, but the shares do not reflect it. Possibly the public has lost faith in the managers of the mines. From the Bodie district the news continues favorable. A six weeks' run of the mill to be made on Mono ore. If her ore is being taken out of the mine. The work being done in both Bulwer and Bodie is quite important.

Private news from the Comstock mines is uniformly favorable, and were the mines managed so as to conform to the laws under which the companies are incorporated, a big boom in the share market would follow. If the fight waged by the Mining Stock Association to create a reform in mine management, so that outsiders can have some show to the bullion produced, and the fight of the Brokers' Combine to compel the rings to buy stocks with which to control the mines, are continued, it will force insiders to the rescue and the market will be saved. Why don't the mining companies lease the mills and mill their own ore? By doing this, all suspicion of collusion will be allayed. The impression prevails that if honesty was aimed at in the management of the mines, this would be done. While whether large fortunes are made through the present milling system on the Comstock may be an open question, it is a fact that the companies said to belong to the mill ring, who lost heavily on the bear side of the share market in 1886, is now reputed to be richer than ever, and those who lost heavily in the wheat deal in 1887 are now better off than before they inaugurated the hull campaign in wheat. With these facts ever present before us, it does seem the height of nonsense to give favorable news from the mines.

Eastern Metal Markets.

NEW YORK, March 30.—The following are the closing prices the past week:

	Silver	Silver	Copper	Lead	Tin
Thursday.....	40 9-16	88 1/2	12 1/2	4 1/2	19 90
Friday.....	40 7-16	88 1/2	12 1/2	4 1/2	19 85
Saturday.....	40 7-16	88 1/2	12 1/2	4 1/2	19 85
Sunday.....	39	85	12 1/2	4 1/2	19 85
Tuesday.....	39	85	12 1/2	4 1/2	19 75
Wednesday.....	39 1/2	85 1/2	11 5/8	4 1/2	19 75

Quicksilver is steady. Tin is fairly steady, as is 1 ad. Copper is a shade easier. Pig iron continues in buyer's favor.

The setback that silver has received in Congress is very discouraging to the silver miners. It was hoped that the Bland bill would meet with better success.

The largest artificial reservoir in America is Buena Vista Lake reservoir in Kern county.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

PACIFIC RAFTING Co., March 25. Object, to carry on the business of constructing rafts of logs, trees, timber, poles, wood and lumber, and transporting the same from point to point on the Pacific ocean. Its says harbors, inlets and tributaries. Capital stock, \$360,000. Directors—E. C. Piche, D. B. Conness, George Gray, C. M. Elliott and F. M. Nilson.

SAFETY GAS-COCK Co., March 25. Object, to make patent safety gas, steam or other cocks. Capital stock, \$100,000. Directors—Henry T. Scott, George Loomis, E. W. Hopkins, David Bush, Silvey M. Smith, E. A. Grow and R. H. Pease.

OWE DRUG Co., March 25. Capital stock, \$20,000. Directors—P. J. Torrey, R. E. Miller, D. W. Kirkland, H. O. Trowbridge and F. S. Stratton of Oakland.

MEXICAN ZARAGOSA AND HIDALGO Mining Co. Capital stock, \$3,000,000. Directors—D. M. Dickhaut, E. F. May, Terence Masters, C. H. Chambers, of this city, and S. R. Norton of Sonora, Mexico.

THEY OBJECT.—The introduction of a bill in Congress providing for the establishment of a United States military post at Reno, Nev., by Senator Stewart of Nevada, is viewed with marked disfavor by members of the Nevada Miners' Unions. The miners consider that it is the entering wedge aimed at the destruction of their labor organizations preparatory to the reduction of their present rate of wages and that the soldiers at the post will be used against miners' union members should they resist any attempt to introduce cheap labor in working the mines. Should there be an uprising among the Indian tribes the Nevada National Guard is considered ample to protect the property and persons of the whites from injury. The companies of the National Guard are composed almost exclusively of miners, who would naturally side with the unions should an attempt be made to introduce cheaper labor in the mines. The miners' unions of Storey and Lyon counties contain 2500 members.

It may be interesting to know what the Trenton Iron Co. are doing in the wire rope tramway business, in addition to the line which they have just so successfully built for the Holy Moses mine in the New Creede district. They have received the following contracts: One line for the Amethyst Mining Co. in the Creede Camp, having a length of 8250 feet, and a capacity of 200 tons per day; another line of 5150 feet for the Smuggler Union Mining Co., in Ouray, Col., with a capacity of 200 tons per day; and another line for one of the Haggin mines in Guanacevi, Mexico, having a capacity of 100 tons per day, and a length of 5960 feet. They are also under contract for one of their large cable hoists for the Avondale Stone Co. of Pennsylvania, and have just completed a duplicate one for the Passaic Quarry Co. of Paterson. They are about to duplicate the big cable transfer over the Susquehanna at Williamsport; and are now constructing additional 800 tons per day tramway for the Pennsylvania & West Virginia Coal Co. in West Virginia, and another for the transportation of culm for the St. Bernard Coal Co. of Kentucky, and also a large haulage plant for the Croton Falls Magnetic Iron Ore Co. near Brewster, N. Y.

PLUMAS COUNTY MINERS.—Plumas county has organized a Miners' Association to operate with the State Miners' Association. The following are the permanent officers: President, Geo. P. Cornell of Crescent. Vice-presidents—J. R. Enscoe, R. L. McGill, R. Thompson, W. N. Goodwin, J. C. Knickrem. At large—James Jones of La

Porte; T. F. Emmons of Greenville; A. D. Hallsted, 12-Mile Bar; A. W. Keddie, Quincy; S. W. Cheyney, Johnsville; Alex. Cameron, Butt Valley. Executive Committee—T. L. Jones, A. R. Bidwell, E. C. Hard, F. G. Hail, J. H. Thomas. At large—A. W. Keddie and C. E. McLaughlin, Quincy. Secretary, Chas. R. Thompson of Spanish Ranch. Treasurer, H. G. Dorsch of Quincy.

ordering send sketch with exact dimensions. Send for Illustrated Circular.

Manufactured by CHROME STEEL WORKS, Brooklyn, N. Y.

H. D. MORRIS, Agent, 220 Fremont St., San Francisco.

Special attention given to the purchase of Mine and Mill Supplies.

Stamp Cam.

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers, thus the vibration and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffling surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from hanging on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

THE PELTON WATER WHEEL

GIVES THE HIGHEST EFFICIENCY OF ANY WHEEL IN THE WORLD. OVER 2000 IN ACTUAL USE.

Affords the most simple and reliable power for all mining and manufacturing machinery. Adapted to heads running from 20 up to 2000 or more feet. From 20 to 30 per cent better results guaranteed than can be produced from any other wheel in the country.

ELECTRIC TRANSMISSION.

The advantages the Pelton Wheel affords in the way of a uniform and reliable power, close regulation, and the facility of adaptation to varying conditions of speed and pressure, have brought it into special prominence and extensive use for this class of work.

All applications should state amount and head of water, power required and for what purpose, with approximate length of pipe line. SEND FOR CATALOGUE.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal. — GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we refer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.

WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

Was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of Best Steel and Wrought Iron. Strong and Durable.

Price.....\$575 f. o. b.

Send for Catalogue and Testimonials.
The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. This excess in length of material effectually prevents the edges from cracking, plain edge belts have to stretch about one inch to the foot as they pass around the drums. This continuous stretch cracks the edges. The improved belt obviates that difficulty.

THE SAN JACINTO ESTATE, LIMITED—Office of General Representative, P. O. address, South Riverside, San Bernardino County.
CALIFORNIA, February 17th, 1892.

GEO. E. WOODBURY:—Your letter of inquiry about your concentrator came to hand in due course. Your machine is doing well, the motion is all right, and the machine is giving entire satisfaction. Yours faithfully,
S. HARRIS.

GEO. E. WOODBURY, Man'fr, 213 to 219 First St., San Francisco.

PATENTED
Aug. 19, 1890.

RISDON IRON WORKS,

S. E. Corner Howard & Beale Sts., S. F.,

MANUFACTURERS OF THE

CELEBRATED

Bryan Roller Mill.

This Mill is a Modification of the well-known "Chile Mill," arranged for the Continuous Crushing of Gold and Silver Ores.

It is POSITIVELY the best Gold Amalgamator in the market.
It saves from Five to Twenty-five per cent more gold than other mills.
Its immediate and free discharge prevents the possibility of sliming.
It requires a minimum of power and crushes hard as well as soft ore.
Its comparatively slow speed insures freedom from excessive wear.

TWENTY-STAMP WET CRUSHING SILVER MILL—BOSS CONTINUOUS SYSTEM OF AMALGAMATION.

The Boss Process of Amalgamation.

The introduction of this system of pan amalgamation into silver milling has been very thoroughly effected, and has proved that it has many excellent features that recommend it, and make it superior in many respects to the tank system of pan amalgamation. The large saving in labor and in power, the cleanliness, the reduced wear and tear because of the uniformity of the load, together with the reduced space re-

quired, and other advantages, make the continuous system of pan amalgamation the favorite with many mine and mill owners. This system gives an exact and equal distribution of pulp through all the pans and settlers, a thorough and uniform mixture of the chemicals with every portion of the pulp, and a rapidly increasing temperature in the amalgamating pans, insuring to each particle of pulp a uniform treatment.

The accompanying plates illustrate a mill equipped with the system referred to, in

which the ore receives precisely the same treatment as in the tank mill, until it has been discharged from the battery; from whence it flows through suitable pipes to the first special grinding-pan, and thence to and through each grinding-pan in the same manner, thence to and through the chemical mixers (where the chemicals are introduced by the chemical feeder), and thence in like manner to and through each successive pan and settler in the order of their arrangement.

The quicksilver supply and its distributing pipes are so arranged that it can be introduced into either of the amalgamating pans as desired. Steam syphons are provided for cleaning the pans, and for a pass by to cut out any pan from the circuit for repairs. The cost of erecting the "continuous" mill is less than the tank mill because of its reduced size it requires less grading and less masonry for retaining walls. Power is applied to the pans direct

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Ed.

The MacArthur-Forrest Process.

The Experiments in California.

MIDDLE CREEK, Shasta Co.,

April 4, 1892.

TO THE EDITOR:—It being generally known that the Calumet Co. was the first to introduce the MacArthur-Forrest process into California on any practical working scale, my time has been considerably taxed in answering letters from very many mining men, not only in California, but elsewhere, all inquiring as to the practicability of the process, etc., etc. Seeing so many are interested, I have concluded to write a description of it, giving data so many desire, and let you publish it.

To preface, the process was first promoted by the Cassel Gold-Extracting Co. of Glasgow, Scotland; from there it was introduced into Australia, South Africa, New Zealand, and the United States. The patents for this country are held by the Gold and Silver Extracting, Mining & Milling Co. of Denver, Colorado, of which ex-Senator Tabor is president, and Col. T. L. Wiswall, secretary. This company was formed some two years ago, but little progress was made, however, until within the past year, and since the Denver company completed their 15-ton mill and commenced working ores, which gave such unexpected and satisfactory returns, in the way of high per cent, that every investigator was filled with wonder, and saw the revolution likely to follow.

On my attention being called to it, now one year ago, I at once started for Denver, and was allowed all the desired privileges for a close investigation. The more I investigated, the more merit the process presented, and I soon became convinced that it was worthy of more than a passing consideration; in fact, in my own mind, concluded to "sail in" and find out all about it, on practical working of our own ores. Returning to California, I commenced a series of experiments, agreeable to instructions received in Denver from their leading chemist, and soon made better results on our ore than made in Denver. It now took no time to decide as to the propriety of introducing the process on a large scale in the Calumet mill, under my management, and where it is now doing satisfactory work and being extended, and will be up to 100 tons a day.

It may be information to many to state that in South Africa 13 mills are now operating the process with great success, and that mills are already in operation in Colorado, Utah, Montana, Dakota and California. At the Needles, in San Bernardino county, a 100-ton mill is in course of erection. Being among the first in this country to accept its merits, I fancy, by this time, I know something about it, and hence presume to speak.

The MacArthur-Forrest process is the use of a weak solution of cyanide of potassium. The strength of cyanide should be, as testing your ore will show, the proper per cent for extracting the highest per cent of the precious metals, say from one-half of 1 per cent to 1½, then treating your ore for a given length of time with this solution; time for treatment is according to the character of your ore and metals, how much base and what kind. To get at this correctly, a few tests are necessary; but it is easily worked out. And here, it is proper to state that time is more the factor of per cent than a high per cent of cyanide. We have made many tests on this point, and all clearly establish this fact. I have failed in per cent of extraction on some ore, and then, by a few experiments, gained high per cents from same. It is a process of study, but once you get time and per cent determined, then there is no failure in your extraction from that especial ore, no matter to what extent you may go. So true has this been with our working, on small and large scale, that taking any ore, from any mine, I would not hesitate to build a 50-ton mill on a simple test of 50 pounds, if the per cent of extraction was satisfactory.

There are two modes of having action from the cyanide on the ore; one is by agitation, and the other is by time and percolation. Revolving barrels, or settlers, as used at times in silver mills, make good agitators. The percolating plan is the use of large tanks, whereby the ore rests in the solution and in time is percolated off into reservoirs. Agitators take attention and power; percolation, less attention and no power; besides, agitated material must be discharged into filtering tanks and allowed time to draw off. At Calumet, we first used agitators as per instructions but after trying percolating, gave it the preference, and are now pushing for enlarged capacity on this plan. This mode of working is being gen-

erally adopted in South Africa, presumably by Mr. MacArthur's instructions. From my S. A. correspondent, I learn they are now constructing all mills for this way of operating the process. The new mill of the Shasta company is also changing to the percolating plan. The Mercur mill of Utah was the first, in this country, to start on the percolating plan, on a scale of 30 tons per day. All percolated solution, whether from agitators or tanks, contain cyanide, gold and silver in solution; consequently, all vessels receiving the same should be perfectly tight, as you presumably are handling valuable liquid. This percolated solution is now transferred to the precipitating box, of size according to value of ore and quantity to be treated. The box used at Calumet is 14 feet long, with 14 apartments. These boxes have wire screens on the bottom, and are filled with zinc shavings four inches deep. The boxes are so constructed, that the solution is made to pass through the body of shavings, which precipitates the gold and silver in a dark blackish powder. By this part of the process, a given part of the zinc is destroyed; but this is of no particular moment, as the loss is but trifling in dollars and cents.

The process is very simple and easily worked, when you have your plant right, and start right on the per cent of cyanide and time for your special ore. As to reducing ore, it is as yet an unsettled question whether it is best to crush wet or dry, all points being considered. The majority of the mills are crushing their ore dry. The Calumet Co. has started out on a new lay, which I think will be the winning one; to wit, crushing by stamps, and running the cyanide solution through the battery instead of water. In other words, crush your quartz in the solution; thus you combine agitation, percolation and expedition.

This, though a new deal, suits us, and thus far no disadvantages present themselves, that override the advantages gained. Of course you have to keep pumping your solution back, and running round. For dry reduction, the Shasta Co.'s mill uses pulverizing barrels. The advantage gained by the use of barrels is, all the ore is of equal grain, and, as you do not require fine crushing for this process, by uniform grain of ore you do faster percolating. Time, however, is the essence of per cent more than fine crushing. As to cost of working the process, there is a good deal to know before this question can be correctly answered; to give some idea, will say from \$2 to \$5 per ton. You can extract the gold and a high per cent of silver from any ore. The question is as to time, and at what per cent of cyanide.

As to silver extraction, at first I paid no attention to it, but have found the process very efficient, except requiring more time than gold; yet silver is in so many combinations that testing should be the only guide for any especial ore. It will work readily all ores worked by pan amalgamation. Taking California ores, from some it will often extract more silver than the total cost of milling. As to cost of plant, for gold it is very much cheaper than the ordinary first-class mill; for silver, the expense will not be half the cost of pan mills.

To express myself as to the process, will be to declare it one of the wonders of the times. I am aware that it has not the friendship of some men of science who talk wisely on what they don't know. To me, all opposition is as a puff of wind in the face of every day demonstrated facts as I handle the process. I have been cursed too often by disappointments in yields, by our old systems, to not appreciate the fact of always being sure of a high per cent of the value of the ore I treat.

One of the astonishing features of the process is, that you can take the heaviest sulphureted ores, and, without roasting, extract 95 per cent of the value out of same, and then you cannot detect any perceptible difference in their appearance. This was the hardest part for me to realize, but I have long ago gotten over the doubt, but not the wonder.

One of the inviting features of the process is that all the machinery you want is for reducing your ore, and power to drive it; and what a comfort there is in this, every millman can realize. Then, coupled with the fact that your returns are certain, a wise man can grasp the future of mining. Thus I give the reader some idea of what the process is. Of course there is more or less detail, which can only be gained by practical manipulation of it.

ALMARIN B. PAUL,

Gen'l Man'g'r Calumet G. Min'g Co.

Questions Concerning the Smyrna Fig.

SAN FRANCISCO, April 4, 1891.

TO THE EDITOR:—As I have been asked different questions in regard to the Smyrna fig and its relation to the gallwasp, I think

it convenient to answer them in your esteemed paper instead of answering separately in different letters.

1. Do you think the fertilization, and in consequence the officiating insect, necessary for the production of the Smyrna fig?

I am convinced it is necessary from the time I learned the views of Prof. Count Solms Laubach, but I confess that, like many others, for a considerable time I have been a skeptic in this matter, and considered capricious a superstition, although I should have known that there exists no superstition that is without some foundation. Superstition always rests on misunderstood or wrongly interpreted facts, and in this case capricious, if a mere superstition, could not have lasted 3000 years if its believers had not seen real benefits resulting from its practice.

2. Are you certain that the blastophaga introduced in spring or summer perishes without offspring?

As to the fact—yes.

As to my explanation, I am not quite certain. There are several explanations possible, but the fact has been noticed and described 3000 years ago by Theophrastus, is confirmed by modern investigation, and here in California also by several failures in the permanent introduction of this insect.

3. Are you certain that the blastophaga can be found in the wild fig during winter?

Yes, because all real gallwasps hibernate in their winged form, with the sole exception of the genus *Teras*, of which I know a European species *Teras Terminate*, which passes the greater part of the winter in the larva state. This exception probably extends to our California *Teras* and may have its cause in the fact that the species of *Teras* inhabit galls of organs that remain in connection with the tree, viz., branches, while all the other gallwasps, as far as I know, produce their galls on deciduous organs, viz., leaves or flowers. The genus *Andricus*, for instance, the cause of galls in the catkins of oaks, falls down with the withering catkin, and consequently has an exceedingly short existence in its larva state.

4. Are you certain that the Smyrna insect will be found in Northern Mexico or elsewhere at a distance nearer California than Smyrna?

Not the Smyrna insect, but another insect doing the same service. In the year 1865, Major Preiss, living near Guaymas, sent me, among other things, some figs of a native tree, which he described as being highly ornamental. These figs must have swarmed with the little parasite, because the cotton and paper were full of dead ones. At that time the observation was without practical value, but later, when the fig question was frequently discussed, I recollected the fact. Since that time I have spoken to several people about the matter, have sent at different times gentlemen to the district, but never obtained anything else except the pierced seeds of the fig, which fact proves that the insect had been there, but had escaped. Such seeds I have received from Lower California, Mazatlan and Hermosillo.

H. H. BEHR.

STRIKES IN EL DORADO COUNTY.—The Georgetown Gazette says: Rich strikes are becoming common this year hereabout. This is the best year for gold-dust our merchants have experienced for many years. We are glad to know that our prospectors are beginning to wake up. For years they have been in a stupor, and now wake up to find most of the best mineral land patented to agriculturists. It is too late now and useless to kick and growl. The Land Department made its rulings, and agriculturists improved the opportunity, while but few miners would take up a claim and hold it in compliance with law. If every man was imbued with sufficient enterprise and forethought to make the best of his opportunities, there would be fewer men cursing the laws and the people to-day.

DISHEARTENING.—We cannot expect any great activity in our ore shipments from now on until the silver hill has been acted upon. With silver below 90 cents an ounce and lead at \$15 per hundred, mine owners would rather have the ore remain in the mine than to rob them at the present ruinous prices. This, at a time when the mining outlook is unusually bright, is certainly disheartening to the people of the Western States.—Salt Lake Journal.

JIGGING.—The Inyo Independent says: Hi, Hamilton from Darwin reports the mining industry moving along steadily. There is considerable "jigging" being done, and this process, while it does not net very large returns to the owner, still it employs a number of men at good wages and evolves values out of old dumps, that otherwise would be useless waste.

The Lordsburg Silver Excitement.

The new silver camp suddenly formed near Lordsburg, not far from Pomona, in Southern California, is not destined to become a second Comstock, although when the strike was first announced the silver assays ran so high that the public was told the amount would influence the price of silver. Of course that was bosh and nonsense. The silver ledges are in the southern part of San Dimas canyon, which runs obliquely through the San Gabriel range of the Sierra Madre mountains. The ledges are seven miles northeast of Lordsburg and 11 miles north from Pomona. They are easy of access. Scores of prospectors have roamed over the same mountains for the past 30 years. There is a tradition among the Spanish and Indians in this region that about 1853 a miner named Hines found several ledges of the richest silver ore he or any one in that country had ever seen; that Hines went to San Diego to get capital interested in his mine and died on the desert on his way there, so all trace of the famous mine was lost.

There have, at different periods in the past generation, been numerous miners who have searched after the lost mine without success. Hundreds of people in the Pomona valley are now firmly convinced that the newly found ledges are those found by Hines and then lost. Jared Wincup, who has prospected for mines all over Nevada and Arizona since 1862, is the finder of the present Lordsburg silver ledges. He has been in the San Gabriel mountains for two years, and found silver ore in San Dimas canyon two weeks ago.

In conversation with a *Chronicle* reporter to-day, he said he knew he had made a great find, but had no idea of the importance of his discovery until he had the ore assayed. He was told that it would yield \$1400 to the ton. He was so delighted that just as soon as he had located his claim he told some men at Lordsburg. They came and saw his ledges, and from that hour the camp has grown at the rate of 200 men a day.

J. H. Mellzner, a drummer, happened to be in Lordsburg the day Wincup made known his find, and Mellzner took specimens to Los Angeles. Before noon the next day there were 60 men on hand from that city with camping outfits, picks and shovels.

The scene at the new mining camp has been most interesting to spectators. There are between 300 and 350 men now in San Dimas canyon. They have already come from distances over 100 miles away, and are from all classes of society. There are scores of old grizzled miners who have done nothing for years and who have packed their old camp utensils together and with blankets and shovels started pell-mell for the new mining scenes. Many of them have already staked out their respective claims, while others are prospecting the mountain and canyon for further finds.

There are about 100 young clerks in stores, farmers, lawyers, boys who have lived with their parents, and even school-boys, who have rushed into the camp and staked out claims here, there and everywhere, without the least idea of locating a ledge or of the indications of ore. There are over 75 men between 35 and 50 years who have come either to see if there is any chance for them to gain sudden wealth or to locate claims if they can see any for themselves.

One-half of all who flocked to the scene of the operations would not know a ledge of silver ore from ordinary dirt. Very many men have spent their last cent to get to Lordsburg, and as many more had to borrow money to get there. Every pick and shovel to be bought in Lordsburg or Pomona has been sold, and farmers have to-day been carting food to the mining camps. There are about 40 tents and 30 shanties up and down the little stream of water that flows through San Dimas canyon. Most of the men have come provided only with blankets. They have suffered because of the unusually chilly weather.

A peculiar thing about this new mining camp is the unusual secretiveness among all who are there. Every one seems to be suspicious of his neighbor, and no one will talk, except in the most careful and confidential manner, about the mining prospects or what has been found.

John E. Winters, who is one of the best informed prospectors in the Pomona valley, said to a *Chronicle* representative:

"I really believe that about five or six men in this camp have found silver ledges that will yield them good fortunes, but that is all there is of it. Wincup, the original finder, shows ore that will make some one very rich if the ledge runs very far down into the earth. Millzner has some very

rich ore, but he will not yet show where he gets it from. If he has a ledge of that kind of ore, he may pull out \$150,000 from this canyon. As for me, I can find nothing yet for myself.

"The rain has hindered work very much, but there are 300 men here who ought to be at home, and who are suffering for their madness for mining. I have been in many mining camps, but I never saw so many greenhorns as there are here. I expect another batch to-morrow and during to-night. They are coming all the time, and this paper ought to stop them."

Colonel J. W. Brooks of Pomona believes that there may be two or three very rich silver ledges in the canyon, but he says that is all there is of it. He has mined for 40 years all over California, but never saw so much and such widespread excitement over a new mining field so suddenly aroused.

World's Fair Mining Department.

The Colorado Board of World's Fair Managers is actively developing the mines and mining section of the exhibit of that State. Realizing the magnitude and richness of her mines and the wealth and variety of her mineral resources, this board has organized a special department of mines and mining and intrusted it with the work of preparing a mining exhibit which will be complete as possible and commensurate with the greatest and most prominent industry of the State. This managers have printed and distributed copies of this general classifications and rules of the department of Mines and Mining of the World's Fair, and have distributed it so thoroughly through Colorado that no mining point has been left without thorough and authentic information of the scope and character of the department.

It is intended that the exhibit of Colorado shall be both technical and economic in its character, showing at once the scientific classification of the mineralogy and lithology of the State, and a correct presentation of its geology, at the same time a popular and massive display of its resources in ores, building stone, coal, iron, commercial clays, oils and all other mineral products of whatever character. Its exhibit will, so far as now developed, be classified within the following divisions: Technical, economic, industrial, mining, metallurgical exhibit, mining machinery, statistical and historical.

The mineral exhibit from Michigan is sure to attract much attention. This will include, besides extensive collections from museums, etc., granites, marble and other building material of rare and beautiful qualities, but which have not yet been marketed to any great extent; raw material from the iron mines in plates 60 to 70 per cent pure, as taken from the mines; and, especially, specimens of copper, which, in its pure state, is found only in the Michigan mines. A copper exhibit, the "largest and most extensive ever attempted," will be made by the Calumet and Hecla mines. In speaking of it, the company's chemist says that it will include "obelisks of pure copper ranging in weight from 50 to 500 pounds; also quantities of wire and sheet copper that has been drawn and rolled from the native metal, just as it was taken from the mines; rods of copper bent into different shapes, and even tied into knots, as one would tie a cravat, without breaking or splintering, as would be the result of such an operation on the copper produced by other mines, and containing an alloy, which renders it less ductile. A curious fact concerning the silver deposits sometimes found in the copper is that nature has welded the silver and copper together without mixing them, whereas no process has ever been discovered by mineralogists by which the same thing can be done artificially; examples of this phenomena will be included in the exhibit."

Consul Partello, at Dusseldorf, informs the Mining Department that since the Emperor has expressed a particular desire that the iron industry of Germany shall be adequately represented at the Exposition, those engaged in the mining and metallurgy of iron throughout the empire have manifested great activity in that direction. From another German source it is learned by the department that Mr. Masseneq, the inventor of an important process for the desulphurization of pig iron by treatment with manganese, will make a full exhibit of the process and the products. This will be an important feature of the division of metallurgy.

A NEW PAVEMENT is finding its way into London, composed of granulated cork and bitumen, pressed into blocks, which are laid like bricks, and present an elastic surface, free from noise and secure for horses' feet.

Sulphur-Mining.

Some Facts Concerning the Industry.

The principal source of the sulphur used in this country is this Island of Sicily in the Mediterranean Sea, off the coast of Italy, and it is estimated that about 90 per cent of it comes from there.

The industry on the island is of great antiquity, but no very important developments have ever been made in the methods and apparatus for mining and fusing the mineral. This is partly due to the lack of enterprise characteristic of the natives, and the aversion of outsiders to invest any capital in the island's industry. Another thing, the seams and veins in which the brimstone generally occurs are so small as to render it unprofitable to incur the expense of mechanical or outfit gearings for regular work.

The richness and importance of a sulphur vein is not to be depended on, as daily experiences have proven that they are liable to "peter" out at a moment's notice. As a consequence, the industry continues as in the past, on a most primitive scale.

The majority of the mines employ hand labor exclusively, machinery being unknown to them. In many instances children are found carrying baskets of the mineral from the pit to the surfaces of the ground on their heads, and it is only in the larger mines that modern apparatus is employed, and even that consists of nothing but hoisting machinery and pumps.

There are practically four systems of melting sulphur employed in Sicily, says the *Manufacturers' Gazette*, the Calcherone, the Sinopoli furnace, the steam process and by Gill's furnace.

The Gill process is of English origin, and has been pretty extensively tried on the island, but it appears to have been unsuccessful, because it required skilled assistance, and but a small quantity of the mineral could be treated at a time.

The steam process is considered quite practical, but only when the mineral is very rich and porous. It emits no fumes, and the product is of good quality. The process consists in filling large iron tubes with the mineral and injecting dry steam into it.

The most popular processes, however, are the Calcherone and the Sinopoli. They require but little or no capital to operate, and are largely used. But, nevertheless, they are not without their disadvantages, for the fumes which they emit render vegetation an absolute failure for many miles around; the sulphur rock being used for fuel in these processes, a large percentage of sulphur is consequently consumed, besides about ten per cent still left in the mineral rock. Then the product is not so valuable as by the other processes.

But a process which appears to be the most scientific is one existing under Spanish patents, and the results obtained from it are excellent. A portion of the mineral to be tried for the perfection of this process was found by chemical analysis to contain 15 per cent of sulphur, and by the Calcherone 5.6 per cent, thus leaving in the mineral but 3.79 per cent of sulphur, instead of 9.4 per cent of the Calcherone. The estimated cost per diem of running a battery of 32 furnaces of the Spanish patent is placed at 69.70 lire.

We give here a detailed description of the popular Sinopoli sulphur furnace. This furnace consists of a series of six or more cells, having vertical, plate-iron walls, and in which cells the mineral is placed. The cells are arranged one above another, separated by a space of 12 centimeters. They are walled with an oven, around which are two fireplaces at different levels. The heat enters from the upper part into this separating spaces, and passing over the walls of the cells, increases the temperature to the melting point. After the cells are filled with this broken mineral, they are covered with a stratum of wet chalk with a hole in each box, which are used as outlets for the various vapors and gases of the mineral. Fire is then started, and after all these vapors and gases have escaped, the intensity of the fire is diminished gradually for 16 hours. When the fire is entirely out, the melted mineral commences to flow off from the front wall of the cell through a hole punctured in its lower part. The whole operation requires about 30 hours. The mineral contained in the six cells ordinarily does not exceed 75 tons, but by increasing the number of cells, and consequently the width of the furnace, the quantity of mineral increases in proportion.

In opening a mine in the United States to produce sulphur in competition with this Sicilian product, two facts must be considered: First, that labor in that country is very cheap; and secondly, freight rates from the island to all seaports is also very low—in fact, the owners of steamers used in the transportation of fruits from Sicily are glad

to get the mineral to use as ballast, and therefore charge next to nothing for its carriage.

This cost of mining cannot be exactly estimated, for the reason that all the mines do not present the same difficulties. Many are from 200 to 300 meters deep, while others can be worked at from 20 to 30 meters below the surface of the ground. The quantity of water to be pumped out, the hardness of the materials covering the brimstone ore, and the direction and dimensions of the seams all cause more or less expense. But as closely as can be figured, the mean cost for obtaining a ton of brimstone is 33 lire for the mining and hoisting, 8 lire for the fusing, and 5 lire for general expenses—a total of 46 lire. To this should be added the government and town dues, which reach as high as 30 per cent of the profits. The transportation of the mineral from inland to the seashore towns is made in part by railway, partly by mule back, the freightage varying in cost, of course, with the distance traveled, while some of the richest mining concerns have private narrow gauge railways for their transportation.

The Debris Bill.

A dispatch from Washington, dated March 31st, says: The California mining committee will probably decide that discretion is the better part of valor, and not attempt to push the debris bill to passage during this session. There is danger in doing so, and it might kill the bill, which really has many friends. Mr. Caminetti is engaged on an elaborate report, which he may present soon, but if it becomes apparent that serious opposition is to be encountered, the report may be held over.

Mr. McMurray has made many friends for the measure among the New York Congressmen, especially those from the city districts, and they have promised their aid when the time comes. Judge Searles has also done good missionary work, as have others of the committee; but the Californians are not quite sure of their ground, and they will ask that the measure be not brought up for consideration until they are sure that there is plain sailing ahead.

Mr. McMurray expressed the opinion today that nothing would be gained and everything might be lost by hurrying.

"We cannot afford to take chances," he said. "The disposition of the House is to be economical, a policy that can be changed to actual parsimony with very little trouble. This show of economy is for election purposes entirely, and there is danger that if the bill is brought up now it will be jumped on hard by the retrenchment and reform crowd, who will not listen to reason, but will make a spectacle of themselves in this act of knocking out a big appropriation."

"If we wait until next December, though, the election will be over. If the Democrats should elect their President, they will be ready and willing to make improvements where they are needed throughout the country, and the good features of our bill would find favor in their eyes. If, on the other hand, the Republicans are successful, the Democrats will conclude that, having gone before the country on a retrenchment and reform platform, and having been defeated, they had better bow to the will of the people and spend more money. Judge Searles is of my opinion. Don't misunderstand me in this matter. I believe our bill will become a law, and there is a question only as to the best time to bring it up in Congress."

If this plan, as outlined in Mr. McMurray's remarks, is decided upon, the gentlemen of the committee will probably return home soon, leaving one of their number to watch the proceedings here. Telegrams received by the gentlemen show that their work here is appreciated in California, and they have been urged to remain in Washington until they have accomplished their object.

ELECTRICAL STONE-CARVING TOOL.—The latest use to which electricity has been put is the working of a stone-carving tool. The inventor is Mr. W. P. Carstarphen of Colorado. The invention is known as the electrical reciprocating tool. The tool is provided with a reciprocating plunger, located and moving within the tubular spools of two coils of insulated copper wire, through which a direct current of electricity is alternately passed. With this tool the carver or sculptor, instead of dividing a portion of his attention to striking his chisel, can devote his entire attention to the lines which he is following, thus producing more accurate and rapid work. It is estimated that the machine will produce work in one-fourth the time of handwork, and therefore, a material reduction in the cost will be secured.

California Tin.

A dispatch from New York, dated March 30th, says: The first shipment of pig tin to reach this city from San Francisco arrived to-day on the Pacific Mail steamship Newport from Colon. It consisted of 334 pigs, weighing 22,000 pounds. This tin is of the best quality, equal to foreign Straits, and will be sold in small quantities to dealers in this city, as samples of an article which in a short time will supply the American market.

It is known as "Temescal tin," coming from the Temescal mines in California. It is consigned to Balfour, Adamson & Co. in the Cotton Exchange building. The consignment was shipped from San Francisco to Panama by the steamship San Juan, and transferred overland to Colon, where it was shipped by the Newport to this port. The consignment is the output of two weeks.

Mr. Simpson, of the firm of Balfour, Adamson & Co., was seen to-day and said: "This is the first consignment of American tin that has reached this city from San Francisco, and our firm is very proud of it. This tin is equal to that from the Straits settlements, and we have notified our brokers to that effect, authorizing him to sell in small quantities. The present shipment is a small one, but it is only this advance guard of what is to follow. As there is only one smelter at work at Temescal at present, it is not expected that the market will be flooded at once, but as soon as we get well at work we can supply the demand."

"The present price of Straits is from 20 to 22 cents per pound. We expect to sell our Temescal at the same rates, and have no idea that we cannot get it. Of course, in the event of large orders, we might do a trifle better in regard to the price. The only drawback at present is the shipping overland, the railroad freight being pretty steep."

"In shipping by water to Panama, overland to Colon, and again by water to this port, we are able to compete. We deny emphatically that America cannot produce tin of the best quality. We have made a statement to our brokers, giving full particulars regarding the tin. The consignees have had several demands made by those in quest of good tin."

"The chances are that the present stock will last only a few days. There was a rumor in the tin market this afternoon that advices had been received from London to lower the price of foreign tin, fearing that the American product may injure them."

CAST IRON.—Mr. Thomas Turner, in a chemical lecture at Birmingham, in speaking of cast iron says: Where special strength is needed care must be taken to have not only the right chemical composition, but also the size and shape of the casting suitable to the iron employed. Some iron is stronger in small castings than in large, while in exceptional instances the opposite is the case. In some forms of patterns, too, with abrupt changes of shape, planes of crystallization are developed, and these are the causes of weakness. Where great crushing strength is required, the iron should be hard and white, or nearly so. For transverse strength a very close-grained grey iron gives the best result; but where tensile strength is most wanted, the iron should be soft and a good working metal, but still close and dense. When iron is too soft, it runs easily and fills every line of the mould, but it is weak.

LORDSBURG is on the Santa Fe line, 37 miles from Los Angeles and 5 miles from Pomona. It is one of the boom towns, and is now being again boomed by a wonderful silver discovery which "beats the Comstock." A mining excitement has started, and men are going there rapidly, but there are more men than claims. This ore runs into the thousands, of course. The assays are supposed to tell that story. This is probably one of those knife-blade finds where it takes a 50-foot shaft to show a ton of ore.

GEORGETOWN DIVIDE.—The year 1892, so far, has been the best experienced for years in placer, seam and milling output on this Georgetown Divide, El Dorado Co. A renewed confidence has inspired the miners, and the result is very gratifying. A fixed purpose and steady perseverance will win in most cases.

STEEL TIES for railroads have not come into general use, but the New York Central has ordered several thousand of the metal ties, which will be put in between the Grand Central depot and Mott Haven Junction. The order has been given after a very successful and satisfactory trial on another section of the road.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH.—Correspondence Amador Ledger, April 2: At the Pacific, work is being pushed ahead. They are working on a huge water skip, for the purpose of getting out the water. It is reported that they have encountered the ledge in the big tunnel. We hope it will not be long before a full force of men goes to work again. The Bay State mine is still hard at work. The water has bothered them so that they have had to procure a pump. Still they are making good headway. The shaft is down nearly 300 feet, with good indications of a mine. The company has a regular pay day every month, which makes a few happy. At the Reeves mine they are taking down the hoist and moving it to the Henry Clay, which joins the North California mine, which C. F. Crocker has bonded for two years. The power to run this hoist costs \$2 per day, while at the Reeves mine for water, with 150 feet pressure. At the Henry Clay they will have 600 feet pressure. The skip is of one ton capacity. Mr. Ballard, of the New London, is having all the New London machinery shipped over to Tuolumne county, where he is interested in mining.

AMADOR GOLD.—Ledger, April 2: There is little new to report in the situation of the Amador gold mine. The reported compromise of the suit between the English and American stockholders has not yet been consummated, although we understand the terms have been virtually agreed upon. The property has been idle for more than eighteen months, and during this time the round timbers on hand when the attachments were served have become almost useless. The value of these originally amounted to several thousand dollars, and might have been sold readily at the time for full value. The principal creditor, however—the Pacific Bank—declined to assent to their being sold, and so the whole lot has been allowed to rot, and is now almost worthless. A representative of the Pacific Bank—Mr. Mitchell—visited the mine last Tuesday, no doubt to look around, and get an idea of the value of the surface improvements at a forced sale. It must be remembered that the bank has been paying the keeper's fees for eighteen months at \$3 per day, amounting at present to over \$700. The negotiations for the purchase of the Kennedy mine by an English company are now completed. It is doubtful whether the purchase will be made. The Kennedy company has been negotiating for the Volunteer mine and other land adjoining, belonging to James Meehan.

SUTTER CREEK.—Taking the water out of the Hector mine commenced in earnest yesterday morning with Maurice Finn and Reel Campbell at the engine. The skips have been put in excellent order and run like a charm. They expect to lower the water to the 200-foot level in about two weeks, when in all probability a temporary halt will be made, to enable them to clean out and open up the drift, from which they expect to get ore enough to run a portion if not the entire mill, until they can get to the deeper levels. In this way it is hoped to meet the running expenses by the product from the mill. As drifting on the ledge at the 900-foot level of the Wildman progresses the improvement is so noticeable that the prospects for a permanent mine are considered more encouraging than at any time since the present company took charge. Only a portion of the mill is running yet, on account of the repairing that is being done in the shaft. In a short time, however, the other stamps will be in motion, most likely on rock from the lower levels. W. Weymouth, superintendent of the Henry Clay mine, between Drytown and Plymouth, called on us this week, and stated that C. F. Crocker, the owner of the Henry Clay property, has bonded the North California mine, adjoining, for a term of years, and it is proposed to begin operations forthwith. A tunnel has been run from the Henry Clay almost to the North California, and it is proposed to prospect the latter by means of this tunnel. They feel confident of opening up a good paying mine.

Butte.

THE OLD RIVER CHANNEL.—Oroville Reporter, March 31: The recent discoveries of the ancient river channel, between Oroville and Bangor, the famous old blue lead, with its auriferous gravels extending for miles, promises to create a boom in mining circles greater than any in Butte for many years. This blue lead or ancient river channel is not a local mine, but it extends for at least 8 or 10 miles, and possibly much farther. There are opportunities for hundreds of rich mines to be developed upon it. At Bangor, the gravel is paying 50 cents per each half barrel, so that a man can take out from \$6 to \$8 each day. When steam engines are used so as to hoist the gravel quickly to the surface, when rock-breakers are made to pulverize the cement, and when all the known appliances of the most experienced miners are put in operation, the output per man will be greatly increased. As there is hardly a limit to this channel, and as it is very rich, the indications are that hundreds of men will be at work during the present spring and coming summer. The channel has been found through such an extent of country that miners are now prospecting for it in a dozen places between this town and Bangor. When struck in these different sections, each mine will be a starting point for others, and thus the whole distance may be threaded with parties of miners, each working the rich gravel and taking out thousands of dollars every day.

Contra Costa.

QUICKSILVER.—Gazette, March 30: The richness of the quicksilver mines in Napa are well known, and now developments are being made in San Antonio valley that promise to disclose a deposit equal to any yet discovered. The quicksilver mines in this county, which were crudely worked many years ago, lie between these two points, and are probably on the same vein. Sometimes expert will renew the prospecting in the San Antonio valley, and the probability is that the company of capitalists going after. Of the Segur a promising report says: "Recently a coalie valley, distant some thirty-

five miles from here, with a view to purchasing it should it turn out to their satisfaction. They recently started to crosscut a vein supposed to be four or five feet wide. At last accounts they had already gone in twenty-eight feet without having reached the edge. Samples of the ore were brought to town and are now on exhibition in McLeod & Wright's office. They are very rich. Should the mine continue to show up as well as it does at present the company will purchase it and begin active and extensive operations."

Calaveras.

THE MATSON MINE.—Angels Echo, April 1: The Matson mine, owned by Hayward & Hobart, situated in the southern part of this town, is one of the best mines in the county. At a depth of 100 feet a crosscut was run and the vein tapped. Then another 100 feet was sunk and another crosscut was run into the vein. This crosscut has been run forty feet into the vein from the front-wall and the hanging-wall has not yet been reached. The ore prospects well. Preparations are now making for sinking another 100 feet, which, when completed, will make the shaft 300 feet deep.

Del Norte.

AT SMITH RIVER.—Del Norte Record, April 1: Near Myrtle creek, on Smith river, C. F. Goodrich has a crew of men mining on the ground worked by him last year with partial success. This time he is having the ground worked different, running the dirt over plates into a "Tom," enabling him to save the fine gold.

El Dorado.

MINE SHUT DOWN.—Grass Valley Telegraph, March 31: The old Pacific mine at Placerville, from which upward of \$2,000,000 has been taken, shut down last week. It is understood, however, that the English company which now owns it, together with six other valuable locations on the same ledge, will soon resume work, utilizing the water power of their canal to generate electricity, by which means neighboring mines are being worked at a ridiculously low figure.

Mono.

BODIE CONSOLIDATED.—Miner, April 1: The ore stopes from No. 1 upraise, above the 500-foot Jupiter shaft level, are yielding fair milling ore. During the past week, north drift No. 1 from east crosscut, 600-foot level, was extended 18 feet. North No. 2, from above crosscut, was extended 12 feet. In both drifts the seam of ore is of good quality but small. South drift from No. 1 upraise, 600-foot level, was extended 8 feet. The ore in this drift is about 4 inches wide, of fair grade. The ore stopes from No. 1 upraise, above the 700-foot level, continue in rich ore.

Nevada.

THE BRUNSWICK MINE.—Grass Valley Telegraph, March 31: The development in the Brunswick Consolidated mine, for the last 40 feet, shows such an improvement that it looks as if, in the near future, there will be another bullion producer in this district. The ledge in the shaft is from 8 inches to 2 feet, showing free gold and high-grade sulphurets. It is in "ribbon rock," and five assays show a value of \$540 and \$560 per ton, the assays having been made by one of our most competent assayers. The prospects are so good that the company proposes to alter the mill, so as to have all the latest improvements—build tramway, large ore bin, place a rock-breaker and make automatic work as much as possible, all for the economical working of the ore.

TAKING OUT A CRUSHING.—Grass Valley Telegraph, March 31: Some time since, a party of Grass Valley mining men leased the Osceola mine, which is situated near Squirrel Creek, back of Rough and Ready. The Osceola was owned years ago by a party of Frenchmen, we believe, and Sam Locke was superintendent of the mine. In those days, the facilities for saving gold were not near as complete as they are now, and work on the mine was soon abandoned and but very little prospecting was done. The parties who now have the mine have found a new ledge, and every part of it shows gold. The ledge can be traced thousands of feet, and at any point you can break off a piece of the rock and find colors of gold. The lessees have taken out quite a lot of rock from a few feet below the surface, and are hauling it to the California mill, which is near by, for crushing. The crushing will be completed in a short time, if the weather does not interfere too much with the hauling of the quartz.

THE OMAHA'S DIVIDEND.—We stated the other day that in all probability the Omaha Mining Company had declared a dividend, as is getting to be its regular custom. Some of the directors were out of town (San Francisco), and the news of their intention about burdening the stockholders with another dividend did not reach here until to day, when it was found they would have to accept 75 cents per share on their stock as a dividend. This dividend No. 5. The mine is looking fine, and Mr. Mainhart says that many more dividends are in sight. The dividend was declared on the 29th instant.

A BRICK.—Grass Valley Telegraph, April 2: The Peabody mine still holds out well, with assurance of continuance. Mr. Tregidgo yesterday had a little gold brick worth \$2,400 that had been pounded out of 22 loads of ore, which ore came from the 400-level, and the ore below that level is just beautiful in gold and rich sulphurets. The Peabody is not a coming mine, it has come and to stay.

GOLD FLAT MINE.—Grass Valley Union, April 2: Good gold-bearing quartz has been struck a little below the 300 level in the Gold Flat mine, of which John Skewes is superintendent. This find is below the former workings, and is regarded as very encouraging. The vein is from 12 to 18 inches in width. This is the property formerly known as the Potosi, when it was worked by Bruce B. Lee as superintendent. The present company consists of residents of Grass Valley and Nevada City. A hoisting and pumping works, run by water power, were erected some months ago, and since their completion the old shaft has been cleaned out and repaired, and the work of development but recently begun. The quartz now being taken out carries a large amount of sulphurets, and also makes a showing of free gold.

A NEW COMPANY.—Grass Valley Telegraph, March 26: The El Dorado Gold Mining Company of Chicago has been incorporated with a capital stock of \$2,000,000. The incorporators are Chas. M. Joyce, N. K. Joyce and W. C. Rogers. This company has been organized for the purpose of

working a mining claim in Grass Valley district, known as the Bonanza Quartz and Gravel Claims, patented ground owned by H. B. Nichols and situated about two miles west of this town. These claims have produced thousands of dollars and some of the specimens have been almost solid gold. No attempt has ever been made to systematically prospect the ground and it is believed that the company have in these claims what may prove to be one of the richest mines on the coast.

Plumas.

MINING OUTLOOK.—Plumas County Bulletin, March 31: The mining outlook for Plumas is very much brighter than it has been for some years, both on account of the reviving interest manifest among the people and because of the unquestioned merits of numerous mining propositions in the various districts of the county. There is a disposition among miners and business men to develop the resources of the county. A great deal of prospecting is going on, many beds of gravel are being opened up and numerous quartz veins tapped. There seems to be an unusual degree of confidence in the mineral wealth of the county, and it certainly is well founded. People seem to be willing to put up their shoulder to the wheel of progress and push, roll, do something to benefit themselves and to bring about general prosperity. Instead of sitting around bemoaning hard times and criticizing the efforts of others, both old and young men have gone to work. The Newtown country, northwest of Quincy, is having quite a boom. Numerous locations have been made of late, and the work of development goes on, thus causing no little interest in that section and excitement with reference thereto. McLaughlin & Stephan have been pushing work at the Golden Gate, preparing to enlarge their mill and extract ore. Thompson & Kellogg, in their quartz mine near Butterfield, have reached the ledge, and a fine body of solid, good-paying ore is reported. H. P. Wormley has purchased the interest of his partner, J. P. Richards, in the quartz mine on which they have been working. The prospects are good, and Mr. Wormley has a show for a fine mine. Lee, Blakesley & Richards are developing the ledge recently discovered and located by them. Goodwin & Bell, and others, have made locations in the same neighborhood. Work is being prosecuted in the gravel mines of Thomas & Thompson, Emigrant Hill, Loring & Leavitt, Bennett & Co., Conley & Orr, and others. The mining prospects for the Indian Valley section of the county are unusually bright—better than for years past. The rich discoveries recently made in the McGill & Standard Consolidated, and at great depth, justifies the conclusion that the vast ore bodies of the county lose none of their richness with increased depth. This property is of such extent as to require many years to exhaust it. The Green Mountain Group is looked to with much confidence as to big results in the near future. The amount of ore in the various properties which the present tunnel will develop, and which are tributary to it, is practically inexhaustible. Much hope is based upon the development work now in progress in the Crescent mine. Should there be opened up at depth the rich ore veins that exist near the surface, the property will prove, as it has been, a great blessing to the town of Crescent and that section generally. The Plumas Consolidated is another property full of promise. It is generally understood that good bodies of ore have been reached during the past four months. Leaving this great mineral belt, a veritable mountain of quartz veins, and going to Genesee Valley, is found another section of the county promising much in the future. The Gruss mine though worked in a small way and at great disadvantage, has produced a great many thousands of dollars. We believe the property is scarcely prospected. The Plumas Eureka country is again coming to the front. Rich developments recently made in the Jamison mine insure much work on that property. A large mill will probably be erected the coming summer and development work engaged in on a large scale. By no means is the great Plumas Eureka mine worked out. She continues to produce, giving employment to a large number of men and scattering a great deal of money in the county. Both the La Porte and the Granite Basin sections of the county are more prosperous than usual. In view of these facts, and that the small hydraulic mines will soon be able to run, we think the future of Plumas county is far brighter now than for many years past. Citizens, therefore, should bestir themselves, take advantage of the situation, and by well directed and vigorous efforts, help intensify the movement now setting in.

San Bernardino.

THE IBEX MINE.—Needles Eye, April 2: Last year, P. K. Klinefelter and a few other gentlemen purchased the Ibex mine, on the desert about 11 miles from Needles. It was demonstrated that the rock carried gold in large quantities. The gold is there right in sight, and there is plenty of it, too. A shaft has been sunk to a depth of 48 feet, and while good-bearing ore has been encountered from the very surface of the ground to the present depth, it is a sight of the ore which they are now getting out which causes the eye to twinkle. The ore is a white honey-comb rock, in which the naked eye can see reposing, in snug little nuggets all through the cells and crevices, pure virgin gold. Upon the dump must be 30 or 40 carloads of this free gold-bearing ore, which will be shipped to the mill for treatment next month. The Eye has known of this property for three years, and has thought all along that the day was not far distant when the Ibex mine would prove a bonanza for Needles, and now it is coming to pass. Think of it! Tons upon tons of free milling ore, which, at a moderate estimate, carries \$500 worth of gold per ton, and then remember that this ore is only 11 miles from Needles.

San Diego.

THE GOLD DIGGINGS.—Julian Sentinel, March 31: The Cowles Bros. are doing work on the North Hubbard, and it is said will run their ore through the Hubbard mill. Mr. Chambers is continuing development work upon the Wilcox mine, and is bringing to view a quantity of rock, which of quality is more than encouraging. The pay rock that Frary and Johnson have struck in the Eagle continues good, and the boys are hopeful of a larger vein of higher grade to come and uphold the good name of this mine. Robert Gardner is following a promising lead of quartz in the old Blue Hill, which would not surprise anyone should it open out into another of those rich shoots for which that spot is

famous. Banner mining matters are as usual progressing steadily onward with no degree of unhealthy excitement. The Bailey Bros. have their pipe line in place, and their improved mill will be crushing ore in three weeks' time. The prospectors' season has opened and several parties have outfitted during the past week for desert exploration. Perseverance in this line bids to prove successful, and we prophesy a big strike in that direction from such continued effort. A party composed of Eastern capitalists and a mining expert came up Sunday and examined the Helvetia, with a view to buying and starting up the works. From remarks made by the viewer it is believed they were favorably impressed with this valuable property, and it is within the range of probabilities that the indebtedness will soon be liquidated, and further development of the mine prosecuted.

NEW DIGGINGS NEAR YUMA.—Los Angeles Herald, March 31: A new mining excitement has broken out near Yuma, on the California side of the Colorado river. A Herald reporter yesterday saw a gentleman of the highest standing in this city who had just returned from the camp. He showed a paper containing about \$10 worth of free gold, which had been panned out in less than ten minutes. The camp is in the Cargo Muchacho district, only about eight miles from Yuma. Miners are flocking in there by the hundreds. The new camp has a feature of stability about it, as it is adjoining the famous Blaisdale ledge, which pays the lessee \$2400 a month. The placers are not on the surface, but are found at a depth of about 40 feet, where a hard gravel is found, and in this it is said the gold can be literally picked out.

Shasta.

NOTES.—Redding Democrat, March 30: Monday, we saw some more samples of lead ore which came from the Cow Creek country, which assays 30 per cent. lead. The placer and gulch miners of the county are having a fair season this winter. This last rain storm is worth a good deal to them. John Wright of South Fork is running a tunnel to tap the rich ore chute on his mine, and drain the same of water. The Hidden Treasure mine on Sick Rock creek, just below the Iron Mountain mill, owned by Ed. Hume, Geo. Dix and two others, was bonded last week for \$8000. A portion of the mine runs into the patented land of the Iron Mountain Mining Company, and it is feared that the litigation started by Col. McGehee's will, will interfere with the sale. The owners of the Hidden Treasure will have to acquire title to a portion of the ground from the Iron Mountain Company. The Bell brothers have stopped work on their lead prospects near Round Mountain for the present, on account of water preventing them sinking deeper. They will resume prospecting when there will be less water to contend with. Joe Bell feels confident there is a big body of good lead ore in the vicinity of Round Mountain. He gets assays from his prospect running as high as 80 per cent. lead, and from 5 to 30 ounces in silver.

Sierra.

GIBSONVILLE.—Mt. Messenger, April 2: The Thistle shaft is employing about sixty men, with good prospects for large reinforcements in the near future. August Holz is superintendent, Eugene Squier clerk, and T. Costello and P. Frazer shift bosses. This is unquestionably a very valuable mine, and its success will ultimately lead to the opening up of other locations along the Gibsonville ridge. It will open a new era in the mining industry of Northern Sierra. It was formerly supposed that the Gibsonville channel and the one worked by the Thistle Shaft were identical, but it is now an established fact that the latter is a separate and more extensive lead. Pilot Peak, Switsure, Michigan, Union, Excelsior, Empire, Tabor and other mines, along the Gibsonville ridge, are thought to be very valuable mining locations. The Tabor mine, joining the Thistle Shaft on the north, will soon be pushed ahead. Its owners think that in a short distance their tunnel will tap the channel. The entire community trust that the company's hopes may be realized, mainly because the principal stockholder, Horace Tabor, has expended many thousands of dollars in trying to develop the property. The Fall River quartz mine, of Butte county, owned mostly by Wolters & Bro., of this place, is another, deserving of special mention. The company is running a hard rock tunnel to tap the main ledge, which, it is thought, will be reached about sixty feet ahead and yield handsome returns. The mining fraternity seem satisfied with the results of the miners' mass meeting of the 5th March, and are eagerly awaiting the action of Congress.

Siskiyou.

SALMON RIVER.—Yreka Journal, March 30: The half dozen stamp mills, aggregating in all about 60 stamps, and several arrastres, are crushing away night and day on rich rock averaging at the different mines from ten to seventy dollars per ton, while large quantities of ore have been exposed during late developments. A development tunnel 300 feet in length, at the Uncle Sam mine, has connected with the ledge at considerable depth below the upper workings, where it is large and extremely rich. A tunnel 600 feet in length, at the Mountain Laurel mine, has tapped the vein where it shows a width of 20 feet between walls, while the 20-stamp mill is unable to dispose of but a small quantity of the rock this mine is capable of producing. The Black Bear Co. continues to produce large quantities of rich rock from a thousand feet beneath the surface. The rich Portuguese mine, as usual, is producing quartz thoroughly impregnated, and often matted together with the yellow stuff. The Hungry Hill Company, on Knownothing creek, have struck their ledge in a long exploration tunnel about 600 feet below the surface and 300 feet below their present workings, showing a width of three feet, averaging \$30 per ton. The Knownothing mine is turning out considerable quartz, while most of the new discoveries located throughout this section are improving with development. The placer mines are being steadily worked, while new and interesting discoveries are occasionally being made. The Hickey Bros. have made the discovery of an extensive tract of gravel high upon the mountain side near Sawyer's Bar, which has yielded them nearly \$3000 in less than a month's run of ten hours a day, and promises to continue doing so for some time to come. The Russian placer miners on Salmon river, below the bar, are having unusual success this season, while Chris Barry, Bigelow, J. M. Fuller, and other indus-

trious and enterprising gravel miners, are being favored with success.

RICH QUARTZ.—Yreka Journal, March 30: A two-foot ledge of great richness has been found at the Empire quartz mine on Klamath river, near Honolulu, four tons of which yielded \$40 per ton, while some of the rock yielded as high as \$100 per ton. This mine has been tested thoroughly by our townsman, C. Lunker, of the Bella Union saloon, who expended several thousands of dollars in developing it, and all will be pleased to hear of his success realized for his perseverance in sticking to it so long. This mine is provided with one of the finest quartz mills in Northern California, and as soon as a good supply of quartz is taken out the mill will be started up. The quartz is very hard, but shows gold to the naked eye in all that is now taken out. The indications are very favorable that this ledge will prove permanent and widen out to greater extent as the work progresses. The miners employed by the Ballarat Company, in sinking down to bedrock under the cement formation in the old Chinese hydraulic claim, Spring Gulch, just north of Yreka boundary line, have been unable to do much work the past week, in consequence of a break-down in machinery, a piece of which had to be sent to San Francisco for repair. They were getting along nicely and expected to strike bedrock in a short time, if the great rush of water had been kept out, which can only be done by means of a powerful steam pump. As soon as the important piece arrives operations will be started day and night until down to the bottom of the gravel bed, as the gold naturally works down to solid foundation in gravel and clay formation.

HYDRAULIC.—The placer and hydraulic miners seem to be quite busy in all the mining camps at present, on account of the water being plentiful by the melting of the snow on the summits of the mountains, and considerable gold dust is being brought into Yreka and other towns, to be sold or shipped below. At Klamath river great preparations are in progress for working several new claims during the coming summer in addition to the old claims, and the income promises to be far ahead of any previous season. Dams are being fixed up and wheels put in for hoisting gravel and raising water for sluices, and some are already in running order. The English company's force of workers to develop the Campbell hydraulic mine in Quartz Valley, is expected to arrive in this county next month, when work at that rich and extensive mine will be commenced on a much larger scale, to result in the taking out of an immense quantity of the glittering dust, as there is an unusually large supply of water this season for a long run.

Trinity.

JUNCTION CITY.—Correspondence Trinity Journal, April 2: The winter, so far as miners are concerned, is a failure; the supply of water is limited, and the outlook for much more is very dubious. The only mine that runs steadily night and day is the Hayes Red Hill mine, the supply of water being derived from Canyon creek. There are at present 43 men on the pay roll. The superintendent has reopened the Old Keno mine. The amount of bullion from this precinct will no doubt be greatly increased, as that mine has been lying idle for several years and was one of the best paying properties in the district.

Tuolumne.

SUMMERSVILLE.—Correspondence Tuolumne Independent, April 1: The New Albany mine, which has been the property of deceased Dr. Walker, is now undergoing vast improvement, notwithstanding that this mine has been running at full blast for several months. Recently Superintendent Fitch of Sonora has added many new buildings and in connection with the same are a new Dodd wheel, rock crusher, ore bins, etc. A large force of men is pushing the work forward with the greatest alacrity and the energetic and enterprising foreman, Mr. Long, anticipates large returns and considers the mine valuable property. The Dead Horse mine still holds its own, and is in excellent working order and is reported to bid success to the company. The rock is reported fine and no doubt the amount of bullion unearthed will prove immense. The Carlotta mine, under the supervision of Mr. Symon, is in active operation, the development of which will increase the mining industry and general prosperity of our little burg. Mr. C. H. Thomas, superintendent of the Dead Horse, is recovering from an accident which he sustained several months ago.

Yuba.

TO DEVELOP A PROMISING MINE.—Grass Valley Tidings, March 24: A party of Grass Valleyans comprising Enoch Rowe, Frank Johns, Stephen Harvey, E. Andrews, W. G. Lord, John George, James Buckett and James Rodda have returned from Brown's valley, Yuba county, where they inspected a quartz mine owned by Hibbert & Burris. There are about 150 tons of ore on the dump, numberless pieces of which show gold very freely indeed, as specimens of the ore brought home bear witness to. The shaft on the claim is 120 feet deep and there is a drift seventy feet on the ledge, which averages a foot in width. But there is no quartz mill nearer than Grass Valley and the owners have not the capital to build one. The Grass Valleyans, all of whom are practical miners, made a thorough inspection of the property and are convinced that it is a good thing. They have arranged for a working bond of the claim, and will invite half a dozen friends to join them in the enterprise and will put a mill on the ground and systematically develop the property. It looks like a paying proposition from the start. There is a light hoisting and pumping plant on the shaft.

NEVADA.

Washoe District.

CONS. CALIFORNIA AND VIRGINIA.—Virginia Chronicle, April 2: There has been extracted from all parts of the mine during the week 1136 780-2000 tons of ore, 149 110-2000 tons of which was shipped to the Morgan mill, and 937 670-2000 tons to the Eureka mill. The average value of all of the ore worked at the Morgan mill during the week, 800 tons, was \$25.30. The Morgan mill has stopped and cleaned up, and the Eureka mill began crushing April 1. Bullion shipped to the Carson mint, assay value about \$19,331.31. Bullion now on hand in assay office, about \$24,500.

MEXICAN.—On the 1465 level the south drift from

the crosscut running east from the bottom of the winze 32 feet east from the winze, has been advanced 22 feet; total 34 feet, continuing in porphyry with quartz of low assay value.

UNION CON.—On the 900 level the joint Sierra Nevada and Union Con. west drift from the shaft has been extended during the week 20 feet; total distance west from the shaft 1800 feet. The face is in porphyry.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, is out west of shaft 1800 feet; face in porphyry.

GOULD & CURRY.—On the Sutro tunnel level the joint north drift with the Savage company was advanced 25 feet; total length, 304 feet; face in porphyry.

HALE & NORCROSS.—From the north drift above the 900 level on our north line a new east crosscut has been started and advanced 15 feet; face in quartz showing some pay ore. On the 900 level have started a winze 30 feet south of our north line to connect with the north stope on the 1100 level. The winze is down 10 feet; the bottom is all quartz, but shows no value yet. On the 1100 level have opened a new stope 40 feet west of the shaft which is yielding fair grade ore. North stope continues to yield the usual quality and quantity of ore. During the week have shipped to Brunswick mill 442 560-2000 tons of ore. Average battery assay \$15.

CHOLLAR.—At a point 150 feet south of north line, 1640 level, started an east crosscut, which is now out 10 feet; face in porphyry.

OCCIDENTAL.—The winze from west crosscut in the south drift, 350 level, is down 39 feet; continues in ore of fair grade. The crosscut on the 400 level, started to meet the winze sunk from the 350 level, is in 45 feet and is showing streaks of pay ore. The south drift, 450 level, is in 37 feet and continues in pay ore. The crosscut from the north drift, 750 level, has reached the foot wall.

SAVAGE.—During the week we have hoisted 729 cars of ore from the 750, 950, 1150 and 1400 levels, and shipped to the Nevada mill 527 tons; milled, 525 tons; average battery assay, \$19.45. Bullion yield for the week, \$7,816. On the 1500 level the upraise started from the main north drift at a point 80 feet north of our south boundary, is advanced 47 feet, being carried up 20 feet during the week. On the Sutro Tunnel level the joint west drift with the Gould & Curry company was advanced 30 feet, making its total 279 feet; face in porphyry and clay.

BELCHER.—The north drift, 300 level, is now out a total distance of 191 feet from No. 2 raise. For the past 23 feet it has followed a streak of good ore ranging in width from 10 inches to 3 feet. The streak is still in sight in the face of the drift near the bottom, where it is 10 inches wide.

CROWN POINT.—Have resumed work in the main west crosscut, 600 level, which is now out 450 feet; face in hard porphyry.

YELLOW JACKET.—Shipping to the Brunswick mill 30 tons of ore daily. The usual prospecting is being done.

Ferguson District.

NEW GOLD FIND.—Cor. Pioche Record, March 26: The new gold find is being worked by two or three miners, and is yielding to the satisfaction of any reasonable person, and since the new assay office has been put in running order, it proves that the wildest anticipations were not overdrawn. On opening the lode, it is found that a cross ledge runs across the first found ledge, that is as rich in horn silver and gold as the first. There are no disconnections among those that came here early and got claims and went to work; but some come here, look around for a few hours, and because they can't find a claim adjoining the discovery claim, they turn their back and start. Yet one man from Pioche did come here last week and located a claim within 600 feet of the Monkey Wrench, and showed your correspondent some very promising indications; and among others was a ledge of rock 30 to 40 feet wide, which carries from \$6 to \$12 in gold. I must repeat that the Ferguson is among the fixed and rich places in Nevada, and will probably step to the front in Lincoln county.

Tuscarora District.

NAVAJO.—Times-Review, April 1: No. 2 winze, 350-foot level, has been extended 8 feet, still showing a little good ore. No change elsewhere.

BELLE ISLE.—The crosscut from No. 1, 350-foot level, extended 15 feet. Crosscut from No. 3, same level, extended 22 feet.

NORTH BELLE ISLE.—The crosscut from the north end of the south 400-foot level extended 12 feet, cutting several small seams giving good assays. North intermediate above the 500-foot level extended 17 feet. South intermediate from same winze extended 13 feet, vein small but the ore is of good grade. No. 4 north drift, south 500-foot level, extended 16 feet, giving better assays.

NORTH COMMONWEALTH.—Second level—Foot-wall raise has been extended 26 feet on the vein, small seam of ore.

DEL MONTE.—Second level—No. 4 raise has been put up 27 feet, vein shows some mineral, but of no value. Third level—No. 1 raise has been extended 24 feet, exposing some low grade ore.

NEVADA QUEEN.—Second level—No. 1 south drift has been advanced 30 feet; No. 1 east crosscut extended 25 feet. Third level—No. 1 stope are looking well, produced 6 cars first and 10 second class ore, \$300 and \$37 per ton. Going east the stope will reach No. 2 raise the coming week, when No. 2 stope will be started and extended along the level to No. 3 raise, where good ore is exposed by the raise. Will not start stope from second level until after connection is made with the shaft.

Montgomery District.

TO RESUME.—Pioche Record, March 26: Montgomery district, just beyond our southwest boundary line, and which created such an excitement among mining men generally only last summer, and lately reported as a "buried El Dorado," will shortly come to the front again. There is merit in the claims discovered there, though the rock is not so "lousy" with free gold as the general reports of the place throughout the country indicated when operations first began. The rock contains free gold, and in great quantities than many a paying gold claim in other parts of the mining country, but the remoteness of the place from all transportation facilities, lying as it does in the midst of a vast desert country, and every needful thing being consequently high in price, the extravagant first management of Montgomery, the discoverer, promised to bankrupt his backers. From a gentleman who has just returned from

the place, we learn that Montgomery has disposed of his interest in the claims to the San Francisco parties, Woodward and others, who furnished the capital for the first working, and that these parties were daily expected on the ground last week, at the time our informant was there. It is the intention of the new owners to resume operations, and on a scale larger than before; and the erection of an additional Huntington mill or two is contemplated. The mines lie only 18 miles from the Fahrump ranch, in a northwesterly direction, and already a number of men are in the vicinity awaiting the opening work. The geographical condition of the country is such that the outlet is to the southward, and Dagget, on the A. & P. railroad will continue to be the general shipping point.

ARIZONA.

AT LYNX CREEK.—Prescott Courier, April 2: W. B. Jones, of the P. & A. C. R'y, has purchased one-half interest in the Sunrise mine, on Lynx creek, from Frank Kuhne. This property was known as the old King mine, when it belonged to James King, who died last December. There is a 50-foot shaft on the mine, which will be sunk to a depth of 100 feet in the near future. The pay streak is two feet wide, ore from which assays 155 ounces of silver to the ton. The property is thirteen miles from Prescott and adjoins J. M. W. Moore's Amulet mine. Mr. H. Yarnell came by way of the Yarnell mine recently, on his trip from his residence in Phoenix in this city. Says he found everything rushing at the Yarnell, and thinks the new mill will start about April 4th. Besides immense quantities of medium grade ore, this mine also has ore which is as rich, perhaps, as any ever found in the Territory. Before us lies a specimen weighing about four ounces which seems to be composed of equal parts of quartz and gold. This property might properly be called a gold quarry, as churn drills are used in breaking ground. It is estimated that the ore can be mined and milled for \$2 per ton, and that there is enough free ore to keep the 25-stamp mill running for a century.

BRITISH COLUMBIA.

WORKING.—Nelson Miner, March 22: Frank Fitch, who along with his partners Jack O'Neil and John Fritz, has been doing development work on the President, a claim on Duck creek, reports a tunnel in 65 feet. While the tunnel is not on the main ledge, it has been in ore all the way. He expects to strike the main body in about another 50 feet. T. C. Wells, who has been at work on the Tam O'Shanter, a claim on the east side of the lake, reports that property looking fine. The tunnel is in about 140 feet on the ledge, which shows a 5-inch streak of ruby silver that gives high assays. The ledge is well defined and carries a good grade of ore its entire width. Owing to the breakage of the pump, work was suspended on the United mine at Ainsworth. Work has also been suspended on the Neosho, owing to the inflow of water. The shaft was sunk 100 feet by windlass, and the water cannot now be handled without machinery. Superintendent Wallace goes to Seattle to consult the owners of the property. Pending letting a contract to sink the shaft another 100 feet, all work other than keeping the pumps running has been suspended on the Krao. Everything is running along smoothly at the Tenderfoot and the Skyline.

DAKOTA.

ORE SHIPMENTS.—Deadwood Pioneer, April 2: The first ore from the Welcome mine was shipped through the city yesterday. It will be taken to Rapid and treated at the chlorination works of the company at that city. Several cars of ore were also brought down from the Boschahel, to be treated at the Golden Reward works. The D. C. brought down a total of 24 carloads of 240 tons, part of which came from the Golden Reward and the remainder from the Maggie. The latter ore is taken to the D. & D. smelter. Total shipment yesterday from Bald Mountain aggregated about 350 tons.

MCGEE DAEGHLIN PLANT.—The crushers and other machinery at this plant are now running. No precipitation has yet been done, and probably none will be for some days to come. The machinery all works smoothly, and there is no doubt that the system will prove an effective and economical method of treating our ores.

MONTANA.

STRUCK THE VEIN.—Phillipsburg Mail, March 24: The striking of the vein in the Bi-Metallic Extension by the diamond drill has been the animating topic of conversation among the people of Phillipsburg, Granite and vicinity for the past few days. That the Extension people would eventually come in contact with the great vein has been the firm belief of a large number of people who took the trouble to look into the matter and study the topography of the country as well as the relative location of the Bi-Metallic Extension properties to those of the two great mines famous in the history of the world's silver producers—the Granite and Bi-Metallic. Rumors of strikes has been made several times recently, but the management of the company has not in-dorsed or verified them in the least until the occurrence of the one announced last week. The first strike was made last week by the diamond drill in the north crosscut on the 450-foot level. When in a distance of about sixty feet from the face of this north crosscut the diamond drill encountered the ore vein which those in a position to know say is very extensive. It is asserted positively that it is over fourteen feet in width, though some claim its width to be greater than these figures. While running through the ore matter the drill encountered a small stringer of granite, and for a time it was thought the body would hardly exceed five feet in width, but when it was determined that after running about a foot farther ore matter was again being run through, the hopes of the management began to rise, and have continued to ever since. The drill was kept working and after passing through this body, and at a distance of about ninety feet from where the boring was commenced, another vein was discovered. The figures in this case are given at eight feet. There is no question now but that the Extension possesses two big leads, the extent of either being sufficient to assure a good paying mine provided the ore is rich enough in quality and the pay-streak reasonably extensive.

LOWER CALIFORNIA.

COPPER.—Yuma Sentinel, March 23: The Boleo Copper Mining Co. work 20 mines and employ 1300 men, of which 900 are regular miners. Twenty-eight miles of railroad connect the different mines with each other. They turned out 460 tons of copper in December and 475 tons in January. The San Juan mines, owned by Cranz Bros., 40 miles north, employ 475 miners and turn out from \$40,000 to \$80,000 in gold per month. The force will soon be increased to 700 men. This speaks well for the Lower California mines.

AT ALAMO.—Lower Californian, March 25: The Aurora mill recommenced running a week ago on rock from the Aurora said to be as rich as any ever taken out. The Borracho mine, belonging to the Aurora Co., is being provided with hoisting works, ore bins, blacksmith shop, etc., and regular development has begun. The shaft is something over 90 feet deep. The stringer in Aurora ground, over the line from the Richmond, is richer than ever. The Princessa mill will soon start. The new vein in the Princessa is rich and of the same character of quartz as the Aurora. The Tomasso Co., has put on eight hour shifts and is steadily sinking. Ground is being broken for the hoisting works, pumps, etc., all of which will be run by electricity. The dynamo will be stationed at the foot of Tomasso hill in the vicinity of the El Paso mill. John Allbright is in Alamo with a party who is looking into the Montezuma mine and mill with a view of purchasing. The mine is promising and should never have lain idle so long. La Flor Co. is getting a lot of rock ahead to make a long run. Capt. Selby runs his Manzanita mill steadily on custom rock.

NEW MEXICO.

MILL.—Southwest Sentinel, March 31: A mill will be erected by the purchasers of the Maud S. mine at Silver Creek this summer. The contract for the lumber to be used in the mill has already been let. Work has been resumed on the Colchis mill below town, and will be continued until the mill is completed. Carpenters commenced work there yesterday. Another shipment of copper bullion will be made from Anson S. smelter in a few days. The Anson S. smelter is producing more copper than any other in the Territory. At a depth of 12 feet, in La Solidad mine, on the east side of the Florida mountains, a strong lead of high-grade ore has been found. It assays over 100 ounces in silver and about 50 per cent lead. Twelve thousand tons of ore are in sight in the Surprise mine at Cook's Peak, and the workings are still in ore. The carbonate strike recently made there is of much greater extent than the owners of the mine expected it would be. Some very fine ore is now being taken out of the Jim Crow mine in the Piedmont district, which will probably be shipped to California, if satisfactory rates can be obtained from the Southern Pacific Company, and the New Mexico and Arizona Company. Some fine specimens of gold, silver and copper ore were brought into town yesterday by a prospector, who says he took them from a claim which he is opening about ten miles from Carlisle. The deal for the Maud S. mine on Silver Creek, which has been pending for some time, has been closed, and the parties will immediately commence the construction of a tramway from the mine. The 35 tons of ore from the St. Helena mine, in the Central district, which was treated in the Bremen mill here, ran about \$14 per ton, and there are large quantities of ore in sight. M. W. N. F. is now engaged in developing five copper mines on Copper Flat, between Central and Ansonito. Deeds were recently put in escrow for these mines by J. H. Bragaw and Andy Johnson. Some very fine copper ore has been taken out of the mines. A strike was made by Bennett & Hill in a claim north of the Grand Central and Texas, in the Central district, last week, which promises to be a very important one. Some of the ore was brought over here for assay and ran \$765 in silver and \$2 in gold per ton. The ore was not very rich on the surface, but as soon as water level was reached, at a depth of about 25 feet, the character of the ore changed completely.

OREGON.

A MILL.—Ashland Tidings, March 23: Archibald Taylor is putting up a mill at the Griffin mine in Slate Creek precinct, Josephine county. Charles and L. C. Bayse have struck a rich and most promising quartz ledge, averaging over two feet in width and assaying \$72 per ton. An extension of Lucky Bart's mine on the Sardine creek divide was last week struck by Menden & Eaton, who think they have as rich a ledge as the original strike. William Bybee has leased his mines on Canyon creek, Josephine county, to O. F. Bussett, while S. F. Fielder is in charge of his claim some distance from Grant's Pass. Among the discoveries in the mining line reported lately are those of a fine ledge by Hardin & Co. on the hill facing the old Centennial diggings, from which a considerable amount of gold has already been taken, the first pocket tapped yielding rich ore. Enoch Roten has also made another of his pocket finds, from which he took about \$250 in one day. Flanagan & Moody of the Messenger mine on Applegate, Jewett & Co., who own the Banket and old Jewett ledges near Grant's Pass, and other Josephine county miners are shipping their concentrates to the Linnton smelter near Portland.

THE PATTON.—Jacksonville Times, March 25: The extensive operations of the Ashland Mining Co. at the Patton ledge in Talent precinct have been so important of late that a write-up in the Ashland papers has been considered proper. It appears as if the company have discovered a mine of equal importance to some of the famous Nevada ledges. The body of ore is so extensive, and the assays have been so favorable as the work progressed, that the company is now satisfied that it will pay them to put up a mill and employ a large force in developing the mine to the utmost during the next year.

ASHLAND.—Tidings, April 1: Superintendent Wilson, of the Ashland Mining Company, is preparing to build a wagon road from the end of the road near B. F. Wagner's place up to the mine. At present, everything hauled to the mine has to be taken around by way of Talent and up Wagner creek, about 12 miles, while a road from the Wagner creek canyon road to the mine makes the distance only about 3 miles from Ashland.

MECHANICAL PROGRESS.

Development of Marine Engines.

Prof. Henry Dyer contributes to the *Scottish Review* a very interesting article, in which he traces the development of steam ships and their machinery. The great improvements which have taken place may be roughly indicated by the amount of coal consumed per indicated horse power per hour. Until about 1830 the boiler pressure seldom exceeded three pounds on the square inch above that of the atmosphere. From that date a gradual increase took place, and in 1845 the average was about 10 pounds per square inch. By 1850 it had reached 15 pounds. In 1856 Randolph, Elder & Co. employed pressures of 30 pounds in their compound engines, but it was not till almost ten years later that such pressures became general in the merchant service. On the compound engine becoming common, pressures suddenly rose to 60 pounds, and in some cases to 80 pounds and 100 pounds per square inch, and now for triple expansion engines the average is over 150 pounds, while for quadruple expansion engines it is 200 per square inch. With regard to coal consumption, the earliest marine engines must have used very nearly 10 pounds per indicated horse power per hour. In the well-known side-lever engines it was about 7 pounds, while for engines in use before the general introduction of the compound type 4 pounds to 4½ pounds was the average. Randolph, Elder & Co., with their compound engines, had an average of from 2½ to 3 pounds. In 1872, when the compound engine had been in use for some years, the average was found to be 2.11 pounds, being a saving of nearly 50 per cent over the ordinary engines, while in 1881 there was a reduction to 1.828 pounds, or a further saving of 13.37 per cent. With triple and quadruple expansion engines there has been a still further reduction of about 25 per cent, the consumption in some of those engines being as low as 1½ or 1¾ pounds per indicated horse power per hour.

Prof. Dyer traces the development of the size of steamships from the Great Western up to the present date. The latest development of the Atlantic race shows a close approximation between the best steamers of the White Star, the Inman and the Cunard lines, there being only a difference of a few hours in favor of the order in which their names are given, the fastest passages of each varying from 5 days 16 hours 31 minutes to 6 days, 2 hours 31 minutes.

Why Good Mechanics are Scarce.

The question why boys do not properly and thoroughly learn a trade in these days has been partly answered by an old employer, who says that boys nowadays are different from what they were when he was a boy. In the good old times they came to learn as much as possible, now to earn all the money they can. Then, apprentices were the children of comparatively well-to-do people, who took pains to bring their children up properly, and were more solicitous, by having their sons properly instructed and by making good mechanics of them, to make them independent of the world. Now, apprentices come mostly from the poorer classes, and are expected to bring as much wages home as possible, so as to help support the family. They only look for the immediate present, regardless of the future. The first question an apprentice asks is how much he is to get a week; he thinks only of his earning capacity, and not of the time it takes to instruct him, nor of the materials he spoils. The next question generally is what hours he will have to work.

The result is that employers now endeavor only to get as much work out of boys as they can, and take no interest in teaching them anything—in fact, boys in workshops, nowadays, are looked upon as so many necessary evils. When the employer ceases to be looked upon and respected as a teacher and educator, and only as an employer, there is an end of any hope for the proper instruction of boys in any mechanical trade. Times have changed, and with them old methods have passed away. We doubt very much if the newer methods are really an improvement. Time will tell.—The Leather Manufacturer.

LARGE HYDRAULIC RIVETING MACHINES.—Two immense hydraulic riveting machines, constructed by the Chester Foundry and Machine Co., have been supplied to the United States Navy Yards at Brooklyn and Boston. The machines are, it is said, the most powerful ever built, and are intended for a working pressure of 1500 pounds to the square inch. They are to

drive rivets up to 1½ inch diameter, with a pressure of 125 tons on the rivet, and a pressure of 25 tons on the plates to hold them together while the rivet is being driven. The machines are 10 feet 6 inches in the throat, and are capable of making the heaviest marine boilers with steel plates varying from ¾ to 1½ inch thick, and up to 16 feet diameter. Boilers up to 30 feet long could be made without any inconvenience. The features of the machine are the extreme simplicity in repacking or for repairs, the internal mechanism being such that it can all be taken apart or put together again in three hours, and the process of repacking can be done in the space of 45 minutes. The cranes over the machine lift 30 tons, and are arranged to lift this weight by a water pressure of 1500 pounds, and the transverse and trolley movements are by hand, and are arranged for handling the boilers to be riveted from the platform of the riveting machines.

Straightening Tempered Steel.

It is well known that files are not usually drawn after being hardened, and that the hardening frequently springs them out of line. But, notwithstanding that, the files are made as hard as they can be by heat and cold water; they are readily straightened after being hardened. This operation is performed at once, as soon as the files have been dipped. The files are taken from the bath of melted lead and chilled while red-hot in a tank of running water. This immersion, for the instant, hardens only the surfaces, while the interior is soft and pliant with heat. At this time the file may be straightened by bending over and under bars. By similar means, crooks in steel arbors, reamers and other long tools may be removed, even after they have been hardened and tempered. A cast-steel saw arbor had received an offset or crook in the journal at one end, just inside the shoulder. The crook was at the worst end, that next the saw, and, although scarcely perceptible to the eye when the arbor was turned on its centers, it was sufficient when the arbor was in the boxes to throw the periphery of a two-foot saw considerably out. The arbor at the bearing part, was very gradually heated, not enough to change color, but a "black heat." A V-shaped block was placed in a vise bearing against the offset side of the journal, and the vise screwed up. At a third trial the arbor came out perfectly true. A contemporary says a tempered reamer was straightened in the same way, the point at which it was crooked being heated by an alcohol lamp. The heat was sufficient to allow the steel to give, but not enough to start to temper. Steel that has a blue temper only may be straightened by blows with a pene hammer on a smooth, clean anvil, the face of which should be warmed enough to remove the chill.—Horseshoers' Journal.

The Best Alloy for Bearings.

Dr. Chas. B. Dudley describes in the *Engineering News* the experiments which have been made on the Pennsylvania railroad, in the search for the best alloy for car-bearings. The alloy which has been adopted is a bronze containing copper, tin and lead, in the proportions of 77, 8 and 15. Extensive experiments have shown that its rate of wear, as compared with the old-fashioned bronze containing 7 parts of copper to 10 of tin, is as 58 to 100, and it is stated to give no more trouble by heating. It has also been tested in comparison with some of the best of the patented bronzes, and showed somewhat superior results, as elsewhere abstracted. Its tensile strength is rather low, only 24,000 pounds, but it is designed for a bearing metal only, and, so far as we know, has not been tested except in the journal bearings of railway rolling stock. The cost of this metal at present market prices is about 10½ cents per pound, whereas the cost of the old-fashioned 7 to 1 bronze is about 11½ cents per pound, and some of the patented bearing metals, on which many engineers are accustomed to rely, are sold at prices far above this figure. A pertinent question in regard to this alloy is whether it wears the journals faster than other metals. No experiments on this point have been made, but it is probable that any notable difference in this respect would have been discovered, since the new alloy has now been in use some time. It is practically certain that there is considerable difference in bearing metals, with respect to wear on the journals; but the laws which govern this variation, so far as we know, are still undetermined.

FAST LOCOMOTIVE-ENGINE BUILDING.—The Baldwin Locomotive Works of Philadelphia claims to hold the record for rapid

locomotive-building. An order was received on January 20th from the St. Louis Merchants' Bridge Co. for four large engines, and on January 25th the engines were finished and ready for shipment. Between the date of filing the order and its completion a Sunday intervened, so that the actual time consumed was only four days, or one day for each engine. The boilers used in the engines were not quite completed when the order arrived, but the work was rapidly pushed forward. One day was consumed in fitting these boilers with water purifiers, and this work had to be done before the flues could be constructed.

THE NEW DISCOVERY IN IRON-MAKING. We are enabled to present our readers with a few further particulars of the electro-metallurgical process which, according to the German experts who have tested the method, is to revolutionize the metal industry. The *Dusseldorfer Zeitung*, a most reliable journal, has published a further long article in which it refers to the incredulity with which its previous statement has in many quarters been received, and remarks that doubts will in due time be dispelled. Not only iron, but also other metals, such as gold, silver, copper and aluminum, can be extracted from their ores by the new and infinitely cheaper method. When it is considered, it continues, that the current generated by a dynamo driven by a small gas or petroleum engine will be capable of extracting dry for day more metal than the largest blast furnace is able to produce, some idea may be formed of the radical changes which are likely to be the result of the employment of the new process. The invention, which is more rightly described as an electro-technical discovery, was perfected three months ago. The inventor has succeeded in devising a practical process which has secured the ready support of a number of well-known American and German capitalists, who purpose forming a gigantic international syndicate. The statement as to the saving of 80 per cent on the present blast furnace method is said to be no exaggeration. The names of the inventor and his supporters are to be made known to the world as soon as the letters patents have been granted.—*Manufacturers' Gazette*.

SCIENTIFIC PROGRESS.

Fuel Gas Value.

Dr. E. G. Love, in the *School of Mines Quarterly*, notes that the promoters of the various schemes for the manufacture and distribution of fuel gas have directed their attention more to the production of a gas which can be sold at a very moderate price, while in many cases at least they have overlooked the fact that the product they propose to sell must be judged primarily by its efficiency as a heating agent. A fuel gas at 25 cents per 1000 feet is no cheaper than another having four times its calorific power at \$1 per 1000; and yet very many consumers will take the first as a much better bargain. It is of the first importance that any fuel gas intended for general distribution should have a decided odor, in order that its admixture with the air may be readily detected. Experience has shown the wisdom of this requirement. Beyond this, its valuation should be arrived at on the same basis as in the case of an illuminating gas, that is, the number of heat units which can be obtained for a given cost.

In considering the extent to which the present supply of illuminating gas can be made to answer the purpose of a fuel gas, Mr. Love holds that the only question is one of cost, as it possesses a characteristic odor and its distribution is already effected. The following are results obtained by him in practical calorimetric tests of the carbureted water gas made by the Municipal Branch of the Consolidated Co. of New York. The tests were made from time to time during the past two years, and the figures give the heat units per cubic foot at 60° F. and 30 inches pressure: 715, 692, 725, 732, 691, 738, 735, 703, 734, 730, 731, 727; average, 721 heat units. Similar tests of mixtures of coal and water gases made by other branches of the same company give 694, 715, 684, 692, 727, 665, 695 and 686 heat units per foot, or an average of 694.7. The average of all these tests was 710.5 heat units, and this, for our present purpose, we may fairly take as representing the calorific power of the illuminating gas of New York. One thousand feet of this gas, costing \$1.25, would therefore yield 710,500 heat units, which would be equivalent to 568,400 heat units for \$1.

The common coal gas of London, with

an illuminating power of 16 to 17 candles, has a calorific power of about 668 units per foot, and costs from 60 to 70 cents per 1000. A large number of fuel gases tested gave from 184 to 470 heat units per foot, with an average of 309 units. The price charged for the gas, however, was in some cases unknown, although presumably as low as 50 cents per 1000.

Some companies have adopted the plan of selling gas, to be used for fuel purposes, at a somewhat lower rate than that for lighting, and in this way are encouraging its use. Of 362 gas companies in the United States, 165, or over 45 per cent, give some reduction to consumers using illuminating gas for fuel purposes. This discount varies from 5 per cent to over 60 per cent on the price charged for the gas used for lighting. Eighty-one companies have a reduction of 25 per cent or more, while the average discount is a little over 24 per cent. From these facts it is argued that the advantages of utilizing our present supply of illuminating gas for fuel purposes are very great, and perhaps sufficient to warrant the prediction that with a cheapening of the cost of production, etc., encouraged by State and municipal control, the illuminating gas will be made to answer the double purpose of lighting and heating.

RAINFALL AND POPULATION.—The distribution of population relative to mean annual rainfall indicates not only the tendency of people to seek arable lands, but their condition as to general healthfulness, says Carroll D. Wright in the *Popular Science Monthly*. The average annual rainfall in this country is 29.6 in., but the variations range from zero to perhaps 125 in. Gauging the distribution of the population in accordance with the annual average rainfall in different localities, some interesting points are observable, not only as to the number of inhabitants in the areas calculated, but as to the density of population. The greater proportion of the people of the United States are living in the regions in which the annual rainfall is between 30 and 50 inches. It is calculated that about three-fourths of the inhabitants of the country are found under these conditions; and, further, that as the rainfall increases or diminishes, the population diminishes rapidly. The density of population in regions where the average rainfall is between 30 and 40 in. is 43.1 per square mile; in regions where it is from 40 to 50 in. annually, the density is 59 per square mile; in regions where the rainfall is from 50 to 60 in. annually, the density is 25.1, and in the arid regions of the West, where the rainfall is less than 20 in., being two-fifths of the entire area of the country, less than three per cent of the population finds its home. The population has increased rapidly in the regions having from 30 to 40 in. average annual rainfall.

THE SOLUBILITY OF METALS.—The insolubility of pure metals in acids has been investigated by Dr. Weeren, a German chemist, who states that chemically pure zinc, as well as many other metals in a state of purity, are insoluble, or only very slightly soluble in acids, because at the moment of their introduction into the acid they become surrounded by an atmosphere of condensed hydrogen, which, under normal circumstances, effectually protects the metal from further attacks on the part of the acid. In the experiments which established this conclusion, the amount of chemically pure zinc dissolved by the acid was first determined; it was next sought to ascertain what difference would follow by performing the experiment in vacuo, when, of course, the escape of hydrogen would be greatly facilitated, and under these circumstances the solubility was found to be increased sevenfold. In the final experiment, namely, to learn the effect of introducing into the acid a small quantity of an oxidizing agent capable of converting the hydrogen film to water, it was found that when a little chromic acid was thus introduced, the solubility was increased 175 times, and when hydrogen peroxide was employed, the solubility was increased three hundredfold.

THAWING FROZEN EARTH.—A novel method of thawing frozen earth for making street excavations was described by H. H. Kelley, superintendent of the Waltham, Mass., Gas Works, in a paper read before the New England Association of Gas Engineers. Stone lime is spread several inches deep over the place where it is desired to excavate, and is thoroughly wetted and covered with straw. A piece of canvas or tarpaulin is spread over the heap, and it is left for 12 hours, more or less. In two cases in which Mr. Kelley has tried this method recently, frost 18 ins. to 26 ins. was removed from the ground. In ordinary cases, the expense of the lime would be too great to permit this plan to be adopted, but gas companies can use the lime afterward in their purifiers.

ELECTRICITY.

Causes for a Dynamo Failing to Start.

In the failure of a series wound dynamo to excite or yield a current, it may be inferred that the external portion of the circuit presents a very great resistance, which may be attributed to several causes.

If it be found that the armature circuits and insulation are in good condition, then the first place to look for the fault is in the brushes, which may not be properly adjusted to the commutator segments, and which, in turn, may be short-circuited to each other. There is a layer of insulating material placed between the commutator segments, which, if of such a substance as to readily absorb copper dust from the commutator, as asbestos fiber or wood, will in turn become conductive. Such substances should not be used.

In new dynamos, mica insulation of commutators is now used, so that this trouble very rarely occurs in them. In some dynamos, however, they are insulated by air-gaps only, and the spaces between them soon become covered with a paste of copper dust and oil, and a connection thereby established.

The loss of current in a dynamo is presumed by many people to be attributable to dirty contacts or simply oxidized brass contacts of brushes with their brackets at the terminals; such, however, is seldom or never the case, but it may so happen that, owing to carelessness, the brushes may become coated with a tough film of oil gum, resulting in imperfect contact with their slides.

As the fault of nonstarting may be wrongly laid to the dynamo, it is well, perhaps, to point out that imperfect contacts are likely to happen at fusible safety plugs, fixed for safety near the dynamo. These plugs are very often made of lead wire, pieces of which are placed near terminals. The use of lead wire is rarely satisfactory, it being almost impossible to secure good contact by its use with an ordinary binding terminal, because, if subjected to a pressure, it flattens out and is rapidly oxidized, finally burning out at the contact points. Where lead wire is used, it should be soldered into brass tubes, so that a hard surface may be afforded for a terminal screw.

Not having been able to locate the fault near the machine, it should be searched for in the external portion of the circuit, beyond switches and cut-outs. It can very readily be determined if the fault actually lies within the machine—that is, within its terminals—by short-circuiting it. The safest way of accomplishing this is to secure one end of a few yards of wire in one of the terminals, and bring the free end against the other for but an instant only. If the machine be excited, a bright flash will mark the breaking of the contact, and sparking will occur at the brushes during contact.—*Electrical Age*.

QUICK WORK.—The new mining camp of Creede, Colo., is attracting many miners from all parts of that State, and is rapidly building up. It already has an electric light plant, which was installed in the quickest time on record. The idea of equipping the plant was conceived at noon, Feb. 1st, by John W. Flintham, general manager of the Denver Consolidated Electric Light Company. Before the day was over, says the *Electrical World*, the Creede Electric Light and Power Company was organized and incorporated, supplies were ordered and placed aboard a special train of cars at Denver that had been chartered from the Denver & Rio Grande Railway Company, and everything necessary for the complete equipment of a model electric light plant for arc and incandescent lighting, by midnight of the same day, was on its way to the modern mining camp. Creede was in sight Tuesday night, Feb. 2d, and by day-break the following morning a gang of laborers was put to work breaking ground and getting the foundations of the power house ready. By this time the town was alive with interest in the work, and pool sellers were offering odds on the time to be occupied in completing the plant. The work progressed night and day, and the electric current was turned on at 11:15 p. m. Saturday, Feb. 6th. The actual time occupied in completing the plant, erecting the buildings and placing the machinery in position, was from Feb. 3d, 7 a. m., to Feb. 6th, 11:15 p. m., less than a week after the machinery was purchased in Denver, over 300 miles away, and this young town was given the latest luxury of civilization. The magnitude of the undertaking will be understood from the following inventory of the plant: Two boilers, 100 h. p. each; one Armstrong & Sims high speed engine 100 h. p.; one pump; one dynamo of 30 arc light; one 400 incandescent light dynamo

and two 50 foot iron smokestacks. Since the house was completed, another dynamo of 60 arc light capacity has been added, and the company will increase the capacity for incandescent lamps to 1000 as quickly as the machinery can be set.

Steam Engines for Electric Lighting.

An extremely interesting paper, read before the Electric Light Convention at Buffalo, was that of Mr. D. Ashworth on "The Allied Powers." Mr. Ashworth reviews the development of the steam engine to meet the requirements of electric lighting. As one stands by and observes the operation of the modern steam engine in its unvarying motion and its great power, the mind is naturally filled with thoughts of the vast amount of labor, time and skill represented by such a mechanical giant. The thought of the countless problems that have been solved and the thousands of difficulties that have been met and overcome in the development of such a machine is bewildering to the finite mind, but the result is a grand monument to the efforts of American students, scientists and mechanics. As perfect as steam engines are, however, there remains room for improvement. An engine running continuously, as is required in electric lighting, must be durable, and in this direction Mr. Ashworth states there is much to be done in the way of betterment. The tendency to multiplicity of parts or movements in valve gear is deplorable, he says. Complications eventually end in interruptions and break downs that frequently entail expenses of alarming proportions and culminate occasionally in an entire abandonment of the plant. Such disasters, of course, are ruinous, and Mr. Ashworth has pointed out the way in which efforts should be directed, with a view to their avoidance. There is no doubt that American ingenuity will solve this problem, as it has done in the case of all others, and experience, combined with scientific thought, will certainly triumph.

Field Magnets with Consequent Poles.

Many dynamo-electric machines are constructed on the consequent-pole principle, says the *Electrical Age*. If we take an iron ring without a break, with projections as pole-pieces, it will be practical, by means of proper winding of the wire on the field-cores, to concentrate the magnetic poles at the two opposite points, known as the pole-pieces.

The ring really, then, consists of two electro-magnets, with their like poles together. This arrangement gives rise to what has been termed consequent poles. An electro-magnet, with consequent poles, was first applied to dynamos by Gramme, who embodied this construction in his constant-current machine as early as 1870.

Consequent-pole field magnets were very commonly used in dynamos until the investigations of Hopkinson and others revealed the fact that this construction generally involved considerable avoidable loss of energy. As commonly carried out, the design embraces a considerable length of magnetic circuit, as it includes—in the Gramme dynamo—the end-frames of the machine. In addition to the extension of the circuit, this form of magnet commonly involves a considerable number of joints—always a weakening feature in field magnets. Experience proves that, although this combined form of field magnet presents many advantages from a constructive point of view, they are more than counterbalanced by the drawbacks already mentioned. An ideal field magnet would have the shortest possible circuit, the greatest possible sectional area, consist of the softest possible iron, and be entirely free from joints.

ELECTRICITY IN A BELGIAN MINE.—The extensive application of electricity to mining work in some parts of Europe is notably illustrated in the case of a lead mine in Metternich, Belgium. *La Lumiere Electrique* says of this mine that not only is it equipped with an electric light plant, but the current is utilized in every department of the work. The output of mineral reaches about 3000 tons per day, and so numerous are the applications of automatic electrical machinery that 25 men is found to be a sufficient force to handle all the work. One of the most novel uses to which the current is applied is an automatic arrangement which registers the delivery of every load at the shaft. Each load, on arriving, establishes a contact which completes a circuit through the office of the works. This circuit operating on an electro-magnet marks a blue line on a band of paper which turns by the movement of a clock. By this means, the regularity of the work and the number of loads delivered is recorded with an accuracy which admits of no dispute.

GOOD HEALTH.

Artificial Light and the Eyes.

Medical men consider that forced and undue recourse to artificial light must have a permanently deleterious effect on the eyes. Eye defects are, it is said, unusually prevalent. Oculists testify to an immense increase in their practice during the last quarter; on the other hand, however, we hear of no abnormal demand for spectacles. The best artificial light for the eyes, says the *Optician*, is a subject that should prove of interest to all classes. It has been dealt with very fully by Mr. Gustavus Hartridge, who deems it essential that a good artificial light should have the following qualities, in order that it may have no injurious effects upon our eyes: 1. It should be of sufficient intensity to produce a good illumination, while it is important that no direct rays shall fall upon the eyes; for in the case of a very strong light such as the arc, if the unprotected light be exposed to it for any length of time, congestion of the eyes, with spasm of the pupil and considerable temporary exhaustion of the retina will take place, and will make itself evident by great dazzling and obscurations of the vision, together with swelling of the eyelids; while in some cases serious injury has been inflicted on the retina, and permanent loss of central vision has occurred. This result may occur from exposure of the eyes to any very intense illumination, and even gazing at the sun has produced the same permanent injury in a few cases. 2. That the light should be absolutely steady and of constant quantity; nothing is more fatiguing to the eyes than the constant flickering which occurs with many gas lights and with unprotected candles. The interruptions which are so liable to occur in the "arc" light is one of its great disadvantages, while the incandescent light has been, by improved mechanical arrangements, rendered nearly absolutely steady. 3. As little heat should be generated by the illuminator as possible, the oxygen contained in the air should not be used up, and the products of combustion should be reduced to a minimum, since heat and the products of combustion are extremely irritating to many eyes. These conditions, Mr. Hartridge considers, are most nearly fulfilled by the incandescent electric light, since it contains only a small amount of irritating rays, is fairly steady, gives off but little heat and no products of combustion, while at the same time the oxygen is not consumed. The difficulties at present are in placing the light in such a position, and in shading them in such a manner, that no direct rays can fall on the eyes; experience alone can overcome this difficulty. The point always to be aimed at is to arrange the light in accordance with the requirements of the room; a system of lights intended to illuminate equally a whole room cannot be expected to be the best illumination for special purposes, such as reading and writing. When the light is required for reading or writing, it should be conveniently placed so as to throw the rays on the book by means of a suitable shade. The light should, in all cases, be subdued. The present mode of hanging the incandescent light with a small porcelain saucer shaped shade above, though probably economical as regards the illumination, is decidedly objectionable. It must be conceded that the electric light, judiciously placed, and carefully shaded, has advantages not possessed by any other artificial illumination. Not only is it the best light for strong and healthy eyes, but even those eyes that are unduly sensitive or the victims of disease may work longer, and with less risk and discomfort, than with gas, oil or candles.

TREATMENT OF INFLUENZA.—Cyrus Edson of the Health Department of the City of New York, publishes a monograph on la grippe and its treatment (D. Appleton & Co.). Three indications are to be fulfilled: 1, means must be taken to assist the system to rid itself of the poison to which the attack is due; 2, pain must be relieved, and 3, not the least important, depression must be counteracted. The first indication is obtained by means of castor oil, or two compound rhubarb pills. Three or four three-grain powders of phenacetine are usually sufficient to relieve headache and muscular pains. Salol, two and one-half grains to each dose, may be added to the phenacetine with advantage. He deprecates antipyrine and its congeners, which serve to augment the depression, and recommends instead Hoffman's anodyne, which is diaphoretic, diuretic and stimulant. To overcome depression during and after the disease, he recommends the free use of tonics. He repeats Prof. Laffont's (of Lille) recommendation of coca preparations, those of Mariani

being given the preference. During the disease a hot grog, one-third Mariani wine of coca and two-thirds sweetened water, is administered, taken very hot, several times a day, the slight diaphoresis induced being a valuable addition to the tonic action. The editor of the *Satellite*, from which this excerpt is taken, recommends the exhibition of coca in the early stages of the disease, with a view to counteract the impending asthenia and curtail the disease.

USEFUL INFORMATION.

A SIMPLE BLUE-PRINTING FRAME.—From one of the second-story windows on the south side of the Pratt & Whitney Works, in Hartford, says *Iron Age*, is an extremely convenient arrangement for blue-printing. It consists essentially of the usual track projecting horizontally from the window sill, and upon this track runs a car formed like a turn-table, and which is prevented from running off the outer end of the track by the upturned ends of the rails. This car carries the blue-print frame, which, placed in position on the car, may be moved to the outer end of the track and then tilted at any desired angle in order to bring the blue prints under the direct rays of the sun, no matter what time of day it may be. This practically mounts the frame on a universal joint, permits utilizing the full power of the sun, and has been found to expedite the printing greatly.

THE NEW ITALIAN RIFLE.—According to an Italian military paper, the Italian Government has decided, after many trials by different infantry regiments, to adopt the 6.5 millimeter repeating rifle, similar to the Mannlicher, for use in the army. The exact particulars of the chosen weapon are as yet kept secret, but the mechanism is stated to be arranged on exactly the same system as that of the Austrian Mannlicher weapon. In well-informed circles, however, it is stated that the new rifle resembles the Mannlicher only in the magazine action. All the other parts have been invented and made in Italy, the bolt action especially being of novel construction. One of the most important recommendations in favor of this weapon is that it only weighs 7½ pounds.

FLEXIBLE METALLIC TUBING.—An English concern is now successfully making flexible metallic tubing that is perfectly tight and capable of resisting high steam or hydraulic pressure. The tubes are made from strips of metal of the required length, breadth and thickness. The strip is fed into a machine in which it is first corrugated longitudinally with a wide and a narrow corrugation, the two running side by side. The strip is carried forward, and is coiled spirally around a mandril in such a way that the smaller corrugation interlocks with the larger one, forming a piston joint. Sufficient spring is left on the tube to cause a perfectly tight joint to be formed.

A COWHIDE HORSESHOE.—In England and on the continent they have been for a long time using a horseshoe made by compressing common cowhide. It is composed of three thicknesses of cowskin pressed in a steel mold, and then subjected to a chemical preparation. It is claimed for it that it is much lighter, that it lasts longer, and that split hoofs are never known in horses using it. It is perfectly smooth at the bottom, no calks being required, the shoe adhering firmly to the most polished surface. Its elasticity prevents many sprains, the horse's steps being lighter and surer.—*Memphis Scimitar*.

STONE should never be used immediately after quarrying. It should be exposed to the weather for a month anyhow before it is used. It thus becomes seasoned and will wear much better. When left to season the under side of the rock as it lay in the quarry should be exposed to the sun. When you buy stone for paving or similar purposes insist on its being turned over, that is reversed from the way it was in the quarry before it is laid. The reason for this is that the top surface is much softer, it being of later formation, stone forming from the bottom.

RUBBER BELTS IN DAMP PLACES.—I. C. W. writes to *Fibre and Fabric* as follows: "To keep rubber belts from slipping in a dyehouse, or in a damp place, or where there is lots of steam, grease them with a composition of boiled linseed oil and ground rosin, mixed together in the boiling, and allowed to simmer to the thickness of molasses or treacle, and apply with a brush. Animal or mineral oils will not answer. Don't use cotton or woolen waste on account of fire."

SAN FRANCISCO:

SATURDAY, APRIL 9, 1892.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Twenty-stamp Wet Crushing Silver Mill, 259; Pocket-loading Lip for Prepared Coal; Steamboat Loading Lip for Handling Coal or Ore in Quantities, 267.

EDITORIALS.—The Boss Process of Amalgamation, 259. The Express Company and the Miners; Water Frontage on the Bay; Mica, 266. Loading Ore and Coal on Cars, 267. California Fish; Miscellaneous, 274.

CORRESPONDENCE.—The MacArthur—Forest Process: Questions Concerning the Smyrna Flg, 260.

MISCELLANEOUS.—The Lordsburg Silver Excitement, 260. World's Fair Mining Department; Sulphur Mining; The Debris Bill; California Tin; Cast Iron; Electrical Stone-Carving Tool, 261. The Cienegas of Southern California, 268.

MECHANICAL PROGRESS.—Development of Marine Engines; Why Good Mechanics Are Scarce; Large Hydraulic Riveting Machines; Straightening Tempered Steel; The Best Alloy for Bearings; Fast Locomotive-Engine Building; The New Discovery in Iron-Making, 264.

SCIENTIFIC PROGRESS.—Fuel Gas Value; Rainfall and Population; The Solubility of Metals; Thawing Frozen Earth, 264.

ELECTRICITY.—Causes for a Dynamo Failing to Start; Quick Work; Steam Engines for Electric Lighting; Field Magnets with Consequent Poles; Electricity in a Belated Mine, 265.

GOOD HEALTH.—Artificial Light and the Eyes; Treatment of Influenza, 265.

USEFUL INFORMATION.—A Simple Blue-Printing Frame; The New Italian Rifle; Flexible Metallic Tubing; A Cowhide Horseshoe; Stone; Rubber Belts in Damp Places, 265.

MINING SUMMARY.—From the Various Counties of California, Nevada, and other Pacific States and Territories, 262-263.

MINING STOCK MARKET.—Sales in the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, etc., 274.

MARKET REPORTS.—Eastern and Local Metal Markets: Coal and Coke, etc., 274.

The Lordsburg Excitement.

There was little or no foundation for the Lordsburg silver excitement in Southern California, as stated in the PRESS when the announcement of the rich strikes was made. In a region where miners are few, those unfamiliar with such matters are apt to be carried away by the sight of a piece of rich ore or an assayer's certificate. Some description of the locality is given elsewhere in this number of the PRESS. The excitement was quite brief, for it did not take many days to show there was little or no basis for it. The population of Lordsburg is not likely to be augmented by a single inhabitant on account of its mines. Pyrites and mica seem abundant thereabout, but no gold and little silver. There are a good many men with little to do in the region thereabout, and it did not take much to induce them to join a mining rush. However, the boom did not last long enough to attract anybody from much of a distance, so that little harm has been done.

ARIZONA is sending out just now about as many accounts of mining strikes as Colorado is in the habit of doing. If the reporters would exercise a little better judgment in the wording, and not use such big figures, the accounts would be better credited and he of some benefit to the Territory.

A DISCOVERY of tin ore is reported in the Old Woman mountains, San Bernardino county, some 20 miles south of Danby station.

The Express Company and the Miners.

The refusal of Wells, Fargo & Co.'s Express Company to contribute anything to the furtherance of the hydraulic mining interests at this critical time has aroused much indignation among the miners. This company has for a long period of years transported all the bullion of this State, amounting to hundreds of millions of dollars, and has charged roundly for its services. The mining camps and towns have depended more on Wells, Fargo & Co. than on the postoffice for the carrying business, not only in bullion, but in packages, parcels, etc.

After the mining convention, when the California Miners' Association was organized, a committee called on prominent banks, business houses and individuals for financial aid in maintaining a committee at Washington to further the mining interests of this State. Money was also collected in the mining counties among the miners. The only refusal to contribute in this city was from Wells, Fargo & Co., the one institution which had made the most money out of the miners.

The verbal refusal, it was thought, might be reconsidered, and the Secretary of the Miners' Association addressed a letter to John J. Valentine, Vice-President and General Manager of Wells, Fargo & Co., asking for financial aid toward defraying expenses of the Miners' Committee at Washington. Mr. Valentine, in his answer, says:

I know of no reason yet for changing the view I entertained on the subject matter of your communication at the interview to which you refer and at which you were present, hence cannot respond favorably to your request. As a company, we are continually being applied to by associations of citizens having various deserving objects in view, often in the line of hethering special industries and localities, but it is no part of our business or moral obligation to help subsidize such enterprises. We claim that for all benefits we may have derived in the past from any particular industry or branch of business we have rendered a quid pro quo in the risk assumed and the service performed. You will understand, I trust, that this refusal does not carry with it any lack of respect or deference for you and others directly interested in the enterprises you wish to promote, or who differ with me in opinion, nor any unfriendliness to the enterprises themselves. I am politically a Democrat, and don't believe in the principle of subsidies in whatever form or to whatever purpose applied.

After the memorial and resolutions of the State Miners' Convention, the Miners' Association, Chamber of Commerce, State Board of Trade, San Francisco Board of Trade, Board of Supervisors, the expressions of the leading newspapers, etc., it would seem as if the manager of a great corporation like Wells, Fargo & Co. might have learned enough about the subject to have expressed himself somewhat differently. He was not asked to subsidize anything or anybody. The company was asked, as were other companies and people, to aid a popular movement which would return a hundred-fold any favors given.

The quid pro quo argument used by Mr. Valentine is refreshing, in view of the excessive charges made by his company for services rendered. The company has a complete monopoly in its line and has had it for over a quarter of a century. It is, next to that of the railroad company, the most oppressive monopoly in this State. It has made more out of the mining interests than any company here. Yet it refuses to contribute a cent toward those interests when they need aid. So large has been its bullion-carrying business that we have depended upon the company for the annual statistics of bullion production of the coast, and its tables have been looked upon as more correct than those from official sources. The aggregate bullion product of the Pacific Coast States and Territories has passed through this company's hands.

If this company had given ten times what was asked of it the amount would have been trifling compared with its profits from the hydraulic-mining industry alone. The company really refuses to assist in reviving an industry which gave it life and main-

tained it for years. And it stands alone in its refusal and its miserly position. The miners will doubtless remember this incident. It may take them some time to "get even," but such ingratitude as this refusal shows will scarcely be overlooked.

Water Frontage on the Bay.

The Risdon Iron Works announce their determination of establishing a ship-building plant in connection with their other business, and are seeking a location on the bay shore. Locations fronting deep water are scarce on the peninsula side of the bay. Potrero point and Hunter's point are already occupied—the first by the Union Iron Works, Pacific Rolling Mills, Sugar Refinery and Gas Works; the second by the dry dock. The heights of the bay between these points, and beyond Hunter's point, are shallow, wide flats extending far out from the beach. On the Marin county shore, where the water is hold, the land is steep and rough; and where the shores are level, the mud flats extend far out into the bay. Moreover, one man owns the entire strip of tide land from Point San Pedro all the way around to Sausalito, including that on Richardson's bay. The shore belongs to a number of different owners, but this one man—Wm. T. Coleman—controls the water frontage, and wharves or landings must be made on his property wherever built.

It was an outrage on the public for the Tide Land Commissioners to have deeded away to any individual the narrow strip called tide land where the deep water comes close to the rocks. In some places this strip is about six or eight feet wide only, but it serves the purpose of controlling water front privilege. Where there are wide mud flats, tide land proper, it was all right, but in other cases, all wrong. However, it is too late to mend matters. The same condition exists all around the bay wherever the tide land is worth anything.

The Risdon Iron Works prefer Oakland for a location, knowing there is no room on the San Francisco side for such a plant as they desire. They can get land bordering on the Oakland Harbor which the Government has paid for, but they cannot get from the land onto the water without paying an exorbitant price. The Oakland Water Front Co. (which is the Southern Pacific R. R. Co.) own almost the entire water frontage there, as Coleman does in Marin county. The Risdon Iron Works want to get 1700 feet of frontage, and a prohibitory price per front foot is asked for what is practically the privilege of crossing the narrow strip owned by the railroad company; and there are, in addition, all sorts of restrictions about building wharves, running ferries, etc.

If Oakland had any sort of enterprise or "go," it would raise a couple of hundred thousand dollars and offer it to the Risdon people to locate there. The works would employ from 1500 to 2000 men. The city is anxious for manufacturing establishments to come there, but does nothing to induce them. San Diego raised a large bonus for iron works, and other Southern cities have shown equal enterprise. But Oakland wants what benefits it can get without paying out any money. The Risdon people have not asked, and do not expect, any subsidy, but it would doubtless settle the question of the location of their works, should such an offer as suggested be made. The works are to be built somewhere on the bay shore, and Oakland harbor offers the best place; but the conditions of purchase, as stated, are not favorable. In fact, it would almost pay Oakland to buy back all the water front it foolishly gave away, for the sake of the manufacturing enterprises which would be established where ship and car meet under such advantageous circumstances.

OAKLAND has voted in favor of \$400,000 bonds for schoolhouses, but refused to vote for \$800,000 for a park and boulevard.

The Boss Process of Amalgamation.

(Continued from page 259.)

from the pan line of shafting through friction clutch pulleys without the use of belts. All water from the battery passes through the pans, and consequently all slimes are treated in combination with the sands. In large mills more than one circuit of pans and settlers may be employed to advantage, each circuit treating a portion of the pulp separately. The cuts (for which we are indebted to the Risdon Iron Works) show a wet silver mill and the arrangement of the continuous system of amalgamation as applied to it.

Mica.

A dispatch from Phoenix, A. T., says: Charles Hand and Ed Spencer struck a mica mine in Mohave county, north of the Colorado river. It bids fair to surpass any producer of that substance in America. The sheets vary in size from 4x10 to 6x10 inches and are remarkably smooth and free from flaws. With the exception of a very slight smoky tinge to that taken from near the surface, the sheets are clear and beautifully transparent. The owners represent that the quantity is apparently inexhaustible and easily accessible. Chicago capital will be put into the enterprise.

This sounds very well indeed, but unless the Arizona mica miners are in better luck than the California mica miners, Chicago capital will not be put into the enterprise. Nobody has made anything out of mica in this State, because there is no demand for it. North Carolina seems to have "the call" on this mineral. Some comes, also, from New Hampshire and Dakota, but the North Carolina product is most in demand. In that State, even, many mines have been closed down on account of the depression in price.

The fact is, the imported mica seems to be preferred to that of domestic production. That which comes from India is considered the best.

An important reduction in the price of mica followed the change in stove patterns by which smaller sheets of mica are used. The increased use of furnaces instead of fireplace heaters has also lessened the use of mica. But a large demand for mica for use in dynamos has sprung up. Strips, usually one inch wide and eight inches long, are made part of the insulating material in building up the armatures. But this new use has had little effect on the domestic mica mines. It is entirely a feature of the import trade, as the manufacturers prefer the foreign material on account of its superior cleavage. There is no doubt that mica which will split into thin and exactly even pieces can be found in the United States, but there is also no doubt that some imported mica has proved more suitable than the usual grade of the domestic material. The consumption of ground mica waste, as an addition to lubricants, keeps our mines running, as about 90 per cent of the domestic is used in this way. The size of the sheets obtainable is, for this purpose, of no moment.

TAILINGS MILL STOP.—The Douglass mill (formerly the Birdall) at Dayton, Nev. has closed down, and it is announced that the mill will not start up again unless the silver hill passes. For several years past it has been running on slimes and tailings deposited at the mouth of the six-mile canyon in the early days of the Comstock. The deposit is sufficient to keep the mill running for 20 years to come, if the price of silver was close to the dollar mark. Fifty men are thrown out of employment. It is reported also that the Ophir mill, which has run on tailings for 12 years, will shut down.

THE Peabody mine, at Grass Valley, is turning out more very rich specimens.

Loading Ore and Coal on Cars.

At the iron breaker at Drifton, Pa., there are two types of loading lips—one for lump and steamboat coal and the other for the sized or prepared coal. The lump and steamboat lips (Fig. 2), of which there are two in each chute, consist essentially of a gate (8 and 11), below which there is a set of bars (7) and below these a sheet iron trough (9), a portion of which (10) is movable and can be slid into the car. When cars are to be loaded, the gate is raised; the coal is allowed to slide slowly over the bars (7), which take out the small coal that has been formed in the chute, and the coal that is cleaned slides through the chutes into the cars. Of course, it is necessary to draw the lump chute into the loading chute gradually, so as to avoid corners, edges and other hindrances, which occasion breakage in the coal.

The loading lips for prepared coal are of two types—one for loading the ordinary open-top cars and the other for loading either the open-top cars or box cars. The two types are shown in Fig. 1—the one on the left hand being for open-top cars and the other for box cars. The coal which falls out above (8) through the opening in the bottom, at the extreme end, passes down over (8) a perforated plate, the form of which is shown to the left of the lower part of the box car. Through these perforations the fine dirt falls out and is carried away by the drag flights (32), the coal sliding through the chute (6) into the car. The only difference on the other side is that the chute (10) slides back on the rollers (11) so as to allow the car to pass. The gates serve to check and regulate the flow of coal. This chute can also be used to load ordinary open-top cars.

The numbered parts of Fig. 1, showing details, are as follows: 2, post of breaker; 3, I-beam supporting plates forming floor of

FIG. 1.—POCKET LOADING LIP FOR PREPARED COAL.

pockets; 4, floor of pockets; 5, bracket on post to support I-beam; 6, side sheets on inside spout; 8, screen jacket forming bottom of lip; 9, side sheet of stationary part of spout on outside lip; 10, side sheet of adjustable spout on outside lip; 11, long roller under adjustable lip; 12, axle for long roller (11); 13, angle-iron support for screen jacket for outside lip; 14, fulcrum bracket for gate; 15, gate for outside lip; 16, bracket for attaching rope; 17, frame for friction rollers, rolling on (9); 18, friction rollers, running on (9); 19, slot to admit gate fulcrum; 20, angle-iron support for screen jacket on inside lip; 21, gate for inside lip; 22, bracket for attaching rope; 23, fulcrum bracket for gate; 24, slot to admit gate fulcrum; 25, rib on floor of pocket to attach rope pulley; 26, pedestal for rope pulley; 27, rope pulley; 28, sheet iron forming inside of drag hopper; 29, sheet iron forming outside of drag hopper; 30, angle connection between drag-hopper side and outside spout; 31, cast drag trough; 32, drag flights; 33, brace to support inside of drag hopper; 34, hanger for long friction roller; 35, angle connection between post and outside sheet of drag hopper; 36, angle connection between inside sheet of drag hopper and spout; 37, built up 24-inch I-beam; 38, cast-iron chair supporting I-beam (3); 39, rabbet strip cast on side of post; 40, cast plates in end of pockets fitting in rabbet strips (39).

The details of Fig. 2 are explained by reference to the following numbered parts: 2, flaring sides of lip above bars; 3, flaring sides of lip on either side of bars (7); 4, bumper; 5, cast iron plates on mouth of lip; 6, bar bearer; 7, finger bars; 8, diamond-pointed gate bars; 9, stationary part of spout; 10, sliding part of spout; 11, planking forming breast of gate; 12, flanges on end of bar bearer (6); 13, finger-bar bolts; 14, stiffeners on end of sheets (3); 15, screenings hopper under bars; 16, inclined trough leading to screenings drag; 17, bracket for carrying friction pulley (18) running on (9); 18, friction rollers running on (9); 19, gate arms; 20, gate fulcrum; 21, hanger for long friction roller under movable spout; 22, long friction roller under sliding spout; 23, shaft for long friction roller; 24, bottom flange on side sheet (2); 25, point of partition wedge.

FIG. 2.—STEAMBOAT LOADING LIP FOR HANDLING COAL OR ORE IN QUANTITIES.

The Cienegas of Southern California.

[A paper read at the last meeting of the American Geological Society by PROF. E. W. HILGARD of the University of California.]

A *cienega*, in the parlance of the native Californian, is a limited area showing a growth of water-loving plants, appearing sporadically in otherwise arid surroundings—usually hillsides or valley margins—and occasionally giving rise to flowing springs. The economic importance lately attained by these *cienegas* as sources of irrigation water by the aid of artesian borings, and some peculiarities of structure upon which their occurrence in that particular region seems to depend, justify at least a brief presentation of the facts to this body.

A simple and typical case in point is presented, for instance, by San Antonio creek, a stream issuing from a canyon in the Sierra Madre near the town of Pomona, in the San Bernardino valley, Los Angeles county. It is near the present divide between the adjacent drainage basins of the San Gabriel river on the west and the Santa Ana river on the east. Though a small stream, carrying only from 700 to 800 miner's inches of water in summer time, it has formed in front of its exit from the canyon a debris cone or "fan" having a radius of seven or eight miles, of which the apex, near the canyon mouth, is between 400 and 500 feet above its base. On the slopes of this fan, as well as near its base, there appear numerous *cienegas*, some less than an acre in area, while others range up to 20 acres and over. In some of these, large sycamore trees are the only unusual indication amid the "bee-pastures" of white sage, cactus and other plants characteristic of the dry mesas of the South. In others there is added the willow and clumps of "tule" (cat-tail) and other swamp plants. From some, springs issue naturally; in all, shallow dug wells find water; in many of them, artesian bores have been made with good success. The deposits penetrated in these bores are, of course, such as may be expected in a debris-fan; but they vary so quickly and completely in wells only a short distance apart as to show that the ancient portions of the fan have been formed under a regime exactly like the present—namely, an alternation of very coarse deposits of gravel and large cobbles, such as are now carried by the stream during the torrential floods to which the high ranges are subject, with fine silt and even clay, which are practically impervious to water. The abrupt diminution of velocity on emergence from the canyon results in the quick accumulation of cobble ridges or "kames," which sometimes change the main channel, within a few hours, to a totally different direction. It is obvious that in past times such changes of channel have thrown the water of the creek from one drainage basin to the other; at present it discharges toward the Santa Ana basin, but unless artificially prevented, there is no reason why it may not some time revert to the San Gabriel watershed.

If we imagine the structure that must result from such a mode of accumulation of a debris-fan, the sporadic appearance and peculiar localization of the *cienegas* (being the point at which the water fed into the cone at the mouth of the canyon is forced near to the surface, either by a cross ridge or by the termination of a water-bearing cobble bed underlain by an impervious layer) is easy to understand. But it is also obvious that the continued supply of water from the stream into the various old channels of the debris cone must depend upon the maintenance of the open gravel surface at the apex of the cone. When this is wholly or partially closed, whether by natural or artificial processes, then, the source of supply being stopped, the springs or artesian wells dependent upon it must diminish or cease to flow. Such variations and stoppages have already been experienced at several points, and as they may prove very costly, if not disastrous, to heavy investments already made, it is quite important that the need of keeping the area of infiltration open for the winter floods should be fully understood by the populations concerned. When this is attended to, it is obvious that we have here natural storage reservoirs for flood waters, annually replenished and likely to be fully refilled each season, no matter how heavy may have been the drafts made upon them during the preceding irrigation season.

The most extensive example of debris-fan storage of flood waters thus far known to me occurs in the upper San Bernardino valley, at the head of which two large streams,

the Santa Ana river and Mill creek, emerge from narrow canyons, at whose outlets there are truly phenomenal accumulations of huge boulders, which in time of flood are tossed about by the torrents with a thundering noise sometimes audible miles away. Here are many square miles of open cobble surface, into which flood waters can be and are absorbed with the greatest ease, although in the usual channels of the summer flow the bottom is made sensibly waterproof by finer sediments. Costly tunnels have been driven through these cobble beds under the impression that large amounts of water could be thus collected; but while the constant drip proves the perviousness and absorbent nature of the deposit, that very circumstance prevents the gathering together of any very large supply of water in the relatively insignificant areas of the artificial drifts.

From the head of the debris-fan of Mill creek to its base, near the town of San Bernardino, the distance is between 12 and 14 miles, according to the initial point chosen; the fall of the surface within the same distance is between 600 and 700 feet. The average width of the valley is about 10 miles, and artesian borings have shown the gravels and cobbles to be nearly a thousand feet in thickness within a mile of the southeastern edge. This enormous gravel mass, filled with water from the floods of the two streams, forms a natural reservoir of such magnitude that the drafts thus far made upon it by the numerous boreholes sunk in the lower valley have failed to show any such degree of mutual interdependence as is usually observed in wells situated short distances apart—a fact which I have ascertained by experimental measurements made under proper conditions. This relative independence of the flow of contiguous wells also indicates that the water-bearing stratum consists of gravel so large and so open that the water mass may be considered as exerting its pressure rather freely in all directions; yet on reopening a closed well there always exists a material accumulation of pressure, which takes several hours to recede to its normal amount.

Besides the artificial outlets mentioned, however, there is a number of natural outlets on the slope of this great gravel reservoir. The most conspicuous is the source of Warm creek, the stream which has been appropriated for the purpose of irrigating the well-known colony of Riverside. Warm creek has no visible connection with any of the streams that descend from the Sierra Madre; it rises in the valley itself, fully three miles away from the foot of the range. There is no obvious reason for its being there, but the water gathers from little rills and ditches within a space of about a quarter of a mile, acquiring within that distance nearly its full volume of from 2000 to 2500 inches during the dry season. At other points, also, "artesian" springs rise with considerable force and volume, and in the immediate floodplain of the Santa Ana river, rivulets gather at many points on the margins, at the foot of the bluff, some 7 or 8 feet above the river channel, and flow toward the latter to increase the volume of the stream. It thus happens that "the entire flow of the Santa Ana river" has been appropriated at least three different points, each appropriator receiving a good flow, and that in the absence of any obvious important additions from incoming streams. As may be supposed, boreholes sunk in this region of spontaneous flows encounter at very small depths (from 120 to 150 feet) very copious flows of artesian water, in cobble-beds; while near the border of the valley not only is a greater depth required and the outflow less, but the materials penetrated are much finer.

Since the terraces of reddish loam that border the foot of the Sierra Madre from the head of the valley to the San Gabriel river indicate plainly that the subdivision of the valley into two drainage basins is a comparatively recent event, it does not seem improbable that the artesian reserve referred to might be tapped by deep borings much farther westward than has heretofore been attempted; perhaps within easy reach of the city of Los Angeles.

A very striking exemplification of the origin of *cienegas* exists in the valley of Temescal Creek, one of the southern affluents of the Santa Ana river, in San Bernardino county. This creek is really the natural continuation of the San Jacinto river of San Diego county, but an intervening lake basin (Lake Elsinore) prevents actual flow from the latter stream to the Temescal valley, save in seasons of extraordinary rainfall. Its water is supplied almost entirely from the canyons of the Santa Ana mountains, which

have a rather copious rainfall in their higher portions. At the head of the valley there is a small lake (Lee Lake), which, with no visible inflow, nevertheless has at its lower end a steady outflow of about 400 miner's inches of water during the dry season, thus forming part of the water supply of the "South Riverside" Colony. Examination shows that the lake is fed entirely by a series of springs, or rather an almost continuous ooze, from the enormous masses of granitic and other debris that have accumulated in front of the two uppermost canyons of the Temescal valley, and which reach entirely across the valley to the foot of the (Temescal) range opposite. These debris masses are so porous that actual surface flow very rarely occurs, and no well-defined bed for a stream exists save where, close to the lake basin, the materials are relatively fine. Evidently the main body of the rainfall gathered into these canyons is stored in the coarser portions of the debris-fans above.

Below this lake basin the Temescal valley is divided lengthwise by a series of low ridges formed of materials mostly impervious to water, of Tertiary age. In front of the canyons of this lower portion of the valley similar great debris masses have accumulated also; but since the impervious ridges mentioned prevent the outflow of water save during actual freshets (when small streams pass through the gaps in the ridges), extensive *cienegas* have been formed between the valley ridges and the foot of the Santa Ana range. In these, as in the upper San Bernardino valley, "artesian" springs rise at many points, and vegetation remains bright green all summer. Borings thus far made have developed a very copious artesian flow, and a tunnel driven through one of the clay ridges toward the *cienega* was suddenly inundated when its face reached the gravel of the debris mass, about 40 feet below the surface. The artesian wells and natural surface flow from these *cienegas*, so far as developed, yield an aggregate flow of nearly 600 miner's inches, which can doubtless be materially increased; and this, with the flow from the lake above, constitutes the water supply for the colonies below.

These examples, which could be greatly multiplied, show sufficiently both the nature and origin of the *cienegas*, and also their practical importance as sources of water supply, which calls for a more careful survey of their extent of occurrence than has heretofore been made. While they do not render the establishment of artificial storage reservoirs superfluous, they do supplement them locally to a very material extent, rendering it possible to occupy for agriculture large areas that otherwise would have remained arid for many years to come. But there arises the question as to the geographic limits within which these natural storage reservoirs may reasonably be sought, for it is notorious that they are not usually found, and the name and idea of the *cienega* is not generally known in the northern portions of California.

The essential condition of *cienega* formation is manifestly the opportunity for the abundant formation of deposits of exceptionally coarse and pervious gravel and cobbles near the points where the canyons emerge from the mountains. This, again, is necessarily conditioned upon the occasional occurrence of violent, torrential rainfall in the mountains, alternating with periods when quiet deposition allows of the formation of water-shedding layers. Another condition appears to be the ready weathering of the parent rocks into rounded forms, by which close packing is prevented, so that abundant interspaces are permanently maintained.

Both conditions are fulfilled to an unusual extent in the granitic ranges of Southern California. The rock is rather easily disintegrated, first into larger and then into smaller rounded masses, from which large quantities of very coarse angular sand have been detached, and which continue to disintegrate rapidly when exposed to the air, but are relatively stable when submerged in the debris mass, and so maintain porosity. Such granitic or granitoid material forms the main body of all the larger *cienegas* I have examined in Southern California, and the remarkably large proportion of potash contained in their waters in consequence is of no small economic importance.

It is therefore reasonable to presume, and it seems *a priori* probable, that a concurrence of the two conditions, climatic and petrographic, is requisite for the formation of *cienegas* upon a practically useful scale, and the extent to which this concurrence actually exists, geographically, is a question of no little practical interest.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

Send for Circulars and Price List.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.
— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock
Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed
Charcoal Iron of great tensile strength.

The weight or thickness of metal used, is graded according to service
required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe
in a bath containing a special mixture of ASPHALTUM, BITUM and
PETROLEUM, at a Temperature of 300° Fahrenheit. It thus
receives a thorough coating both inside and outside, rendering it impervious
to the alkalis of the earth, rust, etc., and is practically indestructible.

Elevator, 12 Floor.

Nevada County Mines.

NEVADA CITY, Cal., April 1, 1892.

TO THE EDITOR: Your correspondent, after spending several days in this really attractive and substantial town, has come to the conclusion that Nevada City is destined to see a better day. Just at present business is rather dull. There are several quartz mines in the district operating, and two or three gravel mines are being worked in a comparatively small way. The great Manzanita hydraulic mine is the principal source of activity. A substantial hoist was erected in the great pit made several years ago by the irresistible streams from the monitors. At this point an incline has been run something like 500 feet toward the channel, and at the time of my visit mining operations had been suspended and the entire force of men was at work moving the old pipe line, it being the intention to carry the water directly to the hoist, where Pelton water-wheels will be used to hoist and pump. Drifting in the rich channel will soon begin and the results are looked forward to with much hope by the men, as most of them are taking stock as part payment for their work.

A few hundred yards distant on the hill back of the Manzanita mine miners are sinking in the gravel deposit of the Odin mine, and others, I was told, were working on the West Harmony. Everybody in this section is looking forward to the resumption of hydraulic mining and a return of the "good old days." One enthusiastic gentleman, a superintendent of one of the most valuable hydraulic mines in all California, said to me: "If we ever do turn the giants loose again no power on earth, or below it, will be able to stop us. Those who have antagonized us heretofore now see their mistake and are as anxious as anyone to see us resume." This seems to be the general feeling throughout the placer mining districts. There are a few who shake their heads dubiously and solemnly prophesy that "it will never be," "too good to be true," etc., but I am confident that the efforts of the Miners' Association have not been in vain, and that two years from now will see a constant stream of golden wealth pouring from these golden hills.

THE QUARTZ MINING INDUSTRY.

At Nevada, quartz mining, while now the chief industry, will quickly fall in the rear when hydraulic mining is resumed. There are, however, at present a number of mines operating here. Among them the Champion, Pittsburg, Gold Flat, Banner, Federal Loan, etc. The Champion is a thoroughly equipped property, located about a mile down the creek from town. It is under the superintendency of L. P. Goldstone, and is doing well at present, I am told.

Captain White is in charge of the Pittsburg, near the city. He is working twenty men. This mine has a good, substantial hoist and a model 10-stamp mill, which is run by Pelton wheels, of which there are two, one for the rock breaker and a larger one for running the batteries and vanners. At present the mill is running on old stull dirt and screenings from the dumps, which Captain White assured me paid handsomely. Meantime, prospecting is being carried on, but with what results I could not learn. The mine has been operated more or less for 40 years past and has made a good record.

The Federal Loan is one of the most promising properties hereabout. It is located in Willow valley district, a few miles from Nevada City. The main shaft is down 400 feet and a vein of blue ribbon quartz from two to five feet in width has been developed. It is quite heavily mineralized, carrying marcasite, pyrite, blende and a little galena. These sulphides, I am told, assay from \$250 to \$500 a ton and are sold readily in the market to the highest bidder. The Federal Loan is a branching vein, as for instance, on the 400-foot level there are three separate drifts, following different spurs of the vein, all of good size and of approximately equal value.

The machinery on this property consists of a hoist and pumps, which have now become inadequate, but contracts are out for new hoisting and pumping machinery which will carry the work down at least 2000 feet. A very convenient mill of five stamps, but arranged with power and other equipments for ten, is at present crushing the ore. Two vanning machines are in use and give perfect satisfaction.

At the Gold Flat, Thomas Wosley, superintendent, sinking is in progress, and some very good-looking ore was being raised at the time of my visit, some of the quartz showing free gold. This property has no mill at present, the owners preferring to first develop a mine. A large and constantly in-

creasing volume of water has to be contended with, though this may not become much greater when farther depth is attained. The mine is located in a flat, basin-like depression and catches a large amount of surface water, besides naturally draining some old workings near at hand. One custom mill is crushing rock in Nevada City, and this appears to do well.

The chlorination works on the edge of town were working two furnaces while I was there. Few facts were obtainable concerning this institution, but from all that could be learned, Mr. Vost is satisfied with his venture.

I am confident that both Nevada City and Grass Valley are on the verge of a new era of prosperity, and it will probably not be long in reaching. Men of little means are out prospecting and new work is being inaugurated in many places, but these men need the aid of the men of means; without this combination, progress is always slow.

W. H. STORMS.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING MARCH 29, 1892.

- 471,943.—INDICATOR—I. Burlingame, Fremont, Wash.
471,944.—REFRIGERATOR—Burnham & Meyers, S. F.
471,935.—TELEPHONE RECEIVER—Christy & Baldwin, S. F.
471,953.—CONNECTING ROD JOINT, ETC.—W. A. Glendham, S. F.
471,635.—CAR BRAKE—W. B. Flinn, S. F.
471,751.—GOLD SEPARATOR—J. B. Freeman, Los Angeles, Cal.
471,968.—ELECTRIC LIGHT CRANE—Jas. Gallagher, Oakland, Cal.
471,856.—PRESCRIPTION FILE—G. L. Goodman, S. F.
471,770.—TRICYCLE—A. E. Miller, Sprague, Wash.
471,878.—STUMP PULLER—W. B. Morris, Seattle, Wash.
471,887.—DENTAL DISK HOLDER—E. E. Park, S. F.
471,91.—BRAKE SHOE—M. A. Penney, Paris, Cal.
471,897.—BEVEL SQUARE—G. R. Richardson, Lathrop, Cal.
471,764.—ADJUSTABLE HEAD SECTION FOR BARS—L. H. Steffy, San Diego, Cal.
471,914.—SAFETY GAS BURNER—G. L. Thuen, Oroville, Cal.
471,915.—PLOW—D. C. Turner, Roseburg, Or.
471,755.—SNATCH BLOCK—A. Uren, Seattle, Wash.
471,918.—HOUSE DOOR LETTER BOX—Ada H. Van Pelt, Oakland, Cal.
471,920.—EXCAVATOR—C. A. Warren, S. F.
471,587.—INSULATING ELECTRIC CONDUCTOR—J. B. Williams, Oakland, Cal.
471,588.—INSULATING ELECTRIC CONDUCTOR—J. B. Williams, Oakland, Cal.

The following brief list by telegraph, for April 5 will appear more complete on receipt of mail advices:

California—Henry Bohls, San Francisco, cigarette machine; Henry P. Christie, San Francisco, friction coupling; David B. Engle, Guerneville, hillside plow; Edwin G. Gillespie, Artesia, music-leaf turner; John Higham, Oakland, baby jumper; Jessie J. Mattie and T. H. Rhodes, Los Angeles, toll-collecting apparatus for telephone; Mondula Leak, San Francisco, exhibition car; Charles L. Mann, Colma, pruning implement; Henry J. Small, Sacramento, label holder; Wm. P. Sweetland, San Francisco, nut lock.

Oregon—Emil Christiansen, Portland, saw filing and setting machine; Andrew T. Lewis, E. Portland, and F. V. Downing, Portland, magazine tack hammer.

Washington—Alexander Begg, Seattle, automatic apparatus for the sale of newspapers; Wm. Grath, Seattle, post-marking and stamp canceling machine; Robert Moran, Seattle, coin-actuated vending machine; Herman A. Todd and A. H. Anderson, Shelton, journal-bearing plate for logging cars and chuck block for logging cars, three designs.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest possible time by mail for telegraphic order. American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

HOUSE-DOOR LETTER BOX.—Ada H. Van Pelt, Oakland, assignor of one-half to C. L. Maxwell. No. 471,918. Dated March 29, 1892. In the construction of letter boxes for the reception of mail matter, it is desirable to provide a box which can be easily attached to the door or other point without unduly marring the wood-work or place to which it is attached; to make the box water and dust proof, and at the same time leave its contents discernible from the outside; to make the operative parts so nearly automatic that but little difficulty will be experienced in operating them, and at the same time make the box of as small bulk as possible. These points appear to have been covered by this invention, and the letter box constructed on this design occupies the least possible depth from the face of the door outwardly, and provides a very safe and tight receptacle for letters and papers.

SAFETY ATTACHMENT FOR GAS BURNERS.—Gerhard L. Thnen, Oroville. No. 471,914. Dated March 29, 1892. This is an attachment for gas

burners, whereby the supply cock or valve is automatically closed whenever the gas is extinguished accidentally or otherwise. It consists of a segment or quadrant loosely fixed to the upper end of the cock, so as to be turned with it or independently of it; a latch by which it is held when the cock is open; a disengaging device actuated by the cooling and contraction of certain parts whenever the gas is extinguished, and a spring acting upon the segment, so that when the latter is released from its holding device, the spring will turn it and cause it to close the cock and cut off the supply of gas. The device is quite an ingenious one, and will be especially useful in hotels, etc., where there is liability of the gas being blown out or turned off and on again by ignorant or careless persons.

DENTAL DISK HOLDER.—Edward E. Park, S. F. No. 471,887. Dated March 29, 1892. This is a mandrel which is especially applicable upon dental engines and lathes. It consists of a sleeve having an enlarged, roughened head or flange, a stem adapted to pass through said sleeve, said stem having a head upon it with its inner face correspondingly roughened, so that polishing or grinding disks may be held between the two roughened faces, and in connection with these of a mandrel adapted to pass through the hand-piece of the dental instrument and having a screw-threaded hole in the end, into which the inner end of the pin is screwed, so as to compress and bind the polishing plate between the head of the sleeve and that of the pin. By this construction a single mandrel may be employed for a great variety and number of different disks, and the expense is greatly lessened, as the mandrel does not have to be sacrificed when the disk is worn out or useless.

ELECTRIC LIGHT CRANE.—James Gallagher, Oakland, assignor of one-half to John A. Britton. No. 471,968. Dated March 29, 1892. This is an improvement in devices for suspending electric lights at street corners and other points. A short distance below the cross arm at the top of the mast or pole is another cross arm or bracket from which rods project, supporting and forming part of the crane proper. By suspending the arm of the crane from the end of the bracket, which projects to one side of the pole, the inventor dispenses with the heavy counterweight which would be necessary upon the opposite side if the arm were journaled upon the top of the pole and the weight of all the parts is reduced. The device is easily operated, so that the lamp-carrying arm can be swung to bring the lamp within reach of the operator on the platform below and can then be raised to the proper position again. The crane is made of gas pipe and is light and ornamental.

Large Power from a Small Amount of Water.

The Pelton Water Wheel Co. have recently furnished the Commercial Mining Co. of Arizona a power plant, which affords a good illustration of the extraordinary results that can be obtained from a small quantity of water under a high head, as also the estimate of value placed upon water power where so large an outlay is made for a comparatively small amount of power. This plant consists of a four-foot Pelton wheel, which runs under a 1200-foot head at 699 revs. per min., developing 45 h. p., using a nozzle tip 53 100 of an inch in diameter. Also a 24 inch Pelton wheel running under the same head at 1380 revs., developing 20 h. p. with a nozzle tip 35-100 of an inch in diameter.

These wheels run a concentrating and smelting plant, including rock-breaker, blowers, pump, etc. The pipe line is 20,000 feet in length, the upper end being 6 and 5-inch casing and the lower end 5-inch lapweld pipe.

All the water supply that can be counted on during the dry season is a flow of about 30 cubic ft. per min. The large expenditure here made in pipe line for results obtained will indicate the advantage that water power has over steam under much more unfavorable conditions than generally exist.

GEARY'S Chinese exclusion bill has passed the House. The bill absolutely prohibits any Chinese, whether or not a subject of China (excepting diplomatic and consular officers and servants) from entering the United States; and Chinese who may hereafter leave the United States are prohibited from returning to this country. It makes liable to arrest Chinese or persons of Chinese descent entering the United States or found unlawfully therein, and provides for their punishment by imprisonment, not exceeding five years, and subsequent removal to the country whence they came, provided when they come by way of contiguous foreign territory they shall be returned to China.

MESSRS. ROBERT McMURRAY and Frank McLaughlin, who have been assisting the Miners' cause in Washington, will return next Monday in company with Hon. Joseph McKenna.

BOOKS OF THE MINING AND SCIENTIFIC PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

GLASS IN BUILDINGS.—For some time past transparent glass bricks have been let into the walls to afford light at places where a window would interfere with the architectural plan; but now it is proposed to cast glass, not necessarily transparent, into large blocks of buildings. This material is practically indestructible, perfectly non-absorbent, and, therefore, damp-proof in a manner which few bricks are, and in this way coarse glass of this kind could be made nearly as cheap as concrete, stone or baked clay.

Complimentary Samples.

Persons receiving this paper marked, are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber please show the paper to others.

MAS. BRUCE B. LEE—Tehama Co.
M. H. TRUETT—Alameda and Contra Costa Co's.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Practical Hydraulics.

A Book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers, and Irrigators.

By P. M. RANDALL.

This new work is by one of the most experienced hydraulicians of the country. It abounds with useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules, and tables are prepared. Thus the needs of the scientist and the practical miner or millman are each met. It is the most complete work on the subject yet published, and is especially applicable to the Pacific Coast.

Table of Contents.

The following brief abstract of the contents will give an idea of the branches of the subject treated:
General Plan; Discussion of the Principles of Hydraulics; Rules Deduced from Formulae Obtained; Examples and Calculations; Extensive Tables for Ready Reference; Fundamental Laws of Hydraulics Demonstrated and Expressed in Formulae and Rules; Flow of Water through Openings; Weir Coefficients; Triangular Weirs; Flow of Water Over Quadrant Weir (tabulated); Application of Tables; Submerged Orifices; Flow through Orifices in Thin Partitions; Tables and Applications; Miners' Inches; Tables and Calculations; Flow of Water Through Short Tubes and Compound Tubes; Flow of Water Through Pipes; Tables of Velocities and Cubic Feet Flows for Given Fall per Mile and Diameter of Pipe; Coefficient for Bend—Circular and Angular; Flow Through Nozzles; Inverted Siphons; Flow of Water in Open Channels; Extensive Tables; Rough and Ready Notes; Hints for Speedy and Approximate Estimates, etc.

Price, \$2.00, post-paid. Sold by DEWEY PUBLISHING CO., Publishers, 220 Market St., San Francisco.

ROSE'S MECHANICAL DRAWING SELF-TAUGHT.

Fourth Edition, Thoroughly Revised and Corrected.
Mechanical Drawing Self-Taught. Comprising Instructions in the Selection and Preparation of Drawing Instruments, Elementary Instruction in Practical Mechanical Drawing, together with examples in Simple Geometry and Elementary Mechanism, including Screw Threads, Gear Wheels, Mechanical Motions, Engines, and Rollers. By Joshua Rose, M. E. Illustrated by 330 engravings. Fourth edition, thoroughly revised and corrected. 8vo. 333 pages. Price.....\$4.00
 BY THE SAME AUTHOR.

Modern Steam Engines. An Elementary treatise upon the Steam Engine, written in plain language for use in the workshop as well as in the drawing office; giving full explanations of the construction of Modern Steam Engines, including diagrams showing their actual operation; together with complete but simple explanations of the operations of various kinds of valves, valve motions, link motions, etc., thereby enabling the ordinary engineer to clearly understand the principles involved in their construction and use, and to plot out their movements upon the drawing board. By Joshua Rose, M. E. Illustrated by 422 engravings. In one volume, quarto, 321 pages. Price.....\$6.00

The Complete Practical Machinist. Embracing Lathe Work, Vise Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, the Making and Use of Tools, Tool Grinding, Marking out Work, etc. By Joshua Rose, M. E. Illustrated by 356 engravings. Fifteenth edition, thoroughly revised and in great part rewritten. 12mo. 439 pages. Price.....\$2.50

The Slide Valve Practically Explained. Embracing Simple and Complete Practical Demonstrations of the Operation of each element in a Slide Valve Movement. By Joshua Rose, M. E. Illustrated by 35 engravings. 12mo. Price.....\$1.00

Steam Boilers. A Practical Treatise on Boiler Construction and Examination. For the use of Practical Boiler Makers, Boiler Users and Inspectors, and embracing in plain figures all the calculations necessary in Designing and Classifying Steam Boilers. By Joshua Rose, M. E. Illustrated by 73 engravings. 8vo. 250 pages. Price.....\$2.50

Illustrated Circulars, giving the full tables of contents of all the above works, sent free to any one who will apply.

The above or any of our Books sent by mail, free of postage, at the publication prices, to any address in the world.
 Our new revised Descriptive Catalogue of Practical and Scientific Books, 83 pages, 8vo, and our Catalogue of Books on Steam and the Steam Engine, Mechanics, Machinery, and Dynamical Engineering, and other Catalogues, the whole covering every branch of Science applicable to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

 226 Market St., N. E. cor. Front (up stairs), San Francisco
 Experimental machinery and all kinds of models. Tin and brasswork. All communications strictly confidential.

PACIFIC ROLLING MILL CO.,MANUFACTURERS OF..... Cast Steel Castings and Steel Forgings

UP TO 20,000 LBS. WEIGHT.

True to pattern and superior in strength, toughness and durability to Cast or Wrought Iron in any position or for any service.

GEARINGS, SHOES, DIES, CAMS, TAPPETS, PISTON-HEADS, RAILROAD and MACHINERY CASTINGS of Every Description.

— ALSO —

HOMOGENEOUS STEEL, SOFT and DUCTILE,
SUPERIOR TO IRON FOR
LOCOMOTIVE AND MARINE FORGINGS.

ALSO Steel Rods, from 1/4 to 8 inch diameter and Flats from 1 to 8 inch. Angles, Tees, Channels and other shape Steel Wagon, Buggy, and Truck Tires, Plow Steel; Machinery and Special Shape Steel to size and lengths. STEEL RAILS from 12 to 45 pounds per yard. ALSO, Railroad and Merchant Iron, Rolled Beams, Angle, Channel, and T Iron, Bridge and Machine Bolts, Lag Screws, Nuts, Washers, Ship and Boat Spikes, Steamboat Shafts, Cranks, Pistons, Connecting Rods, etc. Car and Locomotive Axles and Frames, and Iron Forgings of all kinds, Iron and Steel Bridge and Roof Work a Specialty.

HIGHEST PRICE PAID FOR SCRAP IRON AND STEEL.

Orders will have prompt attention. Send for Catalogues. Address

PACIFIC ROLLING MILL CO., 202 Market St., San Francisco.

FULTON IRON WORKS, HINCKLEY, SPIERS & HAYES, Proprietors.

(ESTABLISHED IN 1865.)

Office, 218 Fremont St., San Francisco.

— MANUFACTURERS OF —

MARINE ENGINES AND BOILERS.— Propeller Engines, either High Pressure or Compound, Stern or Side-wheel Engines.

MINING MACHINERY.—Hoisting Engines and Works, Cages, Ore Buckets, Ore Cars, Pumping Engines and Pumps, Water Buckets, Pump Columns, Air Compressors, Air Receivers, Air Pipes.

MILL MACHINERY.—Batteries for Dry or Wet Crushing, Amalgamating Pans, Settlers, Furnaces, Retorts, Concentrators, Ore Feeders, Rock Breakers, Furnaces for Reducing Ores, Water Jackets, etc.

MISCELLANEOUS MACHINERY.—Flour Mill Machinery, Saw Mill Engines and Boilers, Dredging Machinery, Powder Mill Machinery, Water Wheels.

TUSTIN'S PULVERIZER.

Tustin's Pulverizer
 WORKS ORE WET OR DRY.

ENGINES AND BOILERS

OF ALL KINDS,

Either for use on Steamboats or for use on Land.

Water Pipe, Pump or Air Columns, Fish Tanks for Salmon Canneries

OF EVERY DESCRIPTION.

Boiler Repairs Promptly attended to and at very moderate rates.

AGENTS FOR THE PACIFIC COAST FOR THE

Deane Steam Pump.

SPECIALTIES:

Corliss Engines and Tustin Ore Pulverizers.

Agents and Manufacturers of the Llewellyn Feed Water Purifier and Heater.

RAND DRILL COMPANY,

ROCK DRILLING, AIR COMPRESSING,
 MINING AND QUARRYING
MACHINERY,

23 PARK PLACE, NEW YORK,
 U. S. A.

THOMAS PRICE & SON,
 Assay Office, Chemical Laboratory,
BULLION ROOMS and ORE FLOORS,
 524 Sacramento Street, San Francisco, Cal.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

Metallurgy and Ores.

SELBY
SMELTING and LEAD CO.,
 416 Montgomery St., San Francisco

GOLD AND SILVER REFINERY
 And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

— MANUFACTURERS OF —
BLUESTONE,
LEAD PIPE,
SHEET LEAD,
SHOT, Etc., Etc.

ALSO MANUFACTURERS OF
Standard Shot-Gun Cartridges,
 Under Chamberlin Patent.

JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE
AND MILL SUPPLIES,

ALSO CHEMICALS, AND PHYSICAL, SCHOOL AND CHEMICAL APPARATUS.

63 & 65 First St., cor. Mission, San Francisco.

We would call the attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our full stock of Balances, Furnaces, Muffles, Crucibles, Sootifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price.

Agents for the Morgan Crucible Co., Batavia, England. Also for E. G. Dennis' Patent Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices. Our illustrated Catalogue and Assay Tables sent free on application.

JOHN TAYLOR & CO.

Nevada Metallurgical Works.

NO. 28 STEVENSON STREET,

Near First and Market Streets, S. F.

O. A. LUCKHARDT, Manager.

ESTABLISHED 1869

Ores worked by any Process.

Ores Sampled.

Assaying in all its Branches.

Analyses of Ores, Minerals, Waters, etc.

Working Tests (practical) Made.

Plans and Specifications furnished for the most suitable Process for Working Ores.

Special attention paid to Examinations of Mines; Plans and Reports furnished.

C. A. LUCKHARDT & CO.,

(Formerly Huhn & Luckhardt,

Mining Engineers and Metallurgists.

EVERETTE'S MINING OFFICE.

(Pioneer Mining Geologist's Office of the Pacific Northwest.)

Mining Law, Mine Examinations,
Metallurgy.

ASSAYING AND ANALYSIS.

"Consulting Associate Mining Attorney at Law."

Will examine and report upon "Title and Exact Value of GOLD, SILVER, LEAD, COPPER, COAL, IRON, CLAY or other MINERAL PROPERTIES in any part of the world. Any information mining men may desire to know, relative to the mineral or coal resources of the entire Pacific Northwest, will be honestly given.

DR. WILLIS E. EVERETTE, 1318 E. ST., Tacoma, State of Washington, U. S. A.

The Best Mining District
 On the Pacific Coast!
GRASS VALLEY, CAL.

THE BEST NEWSPAPER published in the district is
THE TIDINGS.

Daily and Weekly edition. Olives all the Mining News. Dealers in Mining Machinery and Mining Supplies will find THE TIDINGS the best medium for directly reaching the owners or managers of mines. Investors in mines will find it to their advantage to subscribe.

Many mines are in successful operation, and new enterprises are being instituted and many others are in contemplation.

DAILY, \$8.00 a year; WEEKLY, \$2.50, in advance.

H. S. SPAULDING, Publisher.

T. C. HOCKING, Editor.

TUBBS CORDAGE CO.
 (A Corporation.)

Constantly on hand a full assortment of Manila Rope, Duplex Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice.
 611 & 613 Front St., San Francisco, Cal.

AMALGAMATING MACHINERY.

Stamp Mills for Wet or Dry Crushing. Huntington Centrillugal Quartz Mill. Drying Cylinders. Amalgamating Pans, Settlers, Agitators and Concentrators. Relorts, Bullion and Ingot Moulds, Conveyors, Elevators, Bruckners and Howell's Improved Whitt's Roasting Furnaces, Etc.

FRASER & CHALMERS, MINING MACHINERY

CONCENTRATING MACHINERY.

Blake, Dodge and Cornish Crushers, Cornish Crushing and Finishing Rolls, Harz Plunger and Collom Jigs. Frue Vanner & Embrey Concentrators, Evans', Calumet, Collom's and Rittenger's Silice Tables, Trommels, Wire Cloth and Punched Plates. Ore Sample Grinders and Heberle Mills.

IMPROVED CORLISS AND SLIDE VALVE STEAM ENGINES. ❖ BOILERS ... AND SECTIONAL ... IMPROVED STEAM STAMPS

CIVIL, MECHANICAL, and MINING En-
gineering, Surveying, Architecture, Drawing, Assaying
and Navigation, GRAPHS, Drawing and Mathemat-
ics for the trades. Send for circulars. Day and evening.

JOHN T. EVANS,

Assay Office and Chemical Laboratory.

ROOMS 46 AND 47 MONTGOMERY BLOCK, 628
Montgomery Street, San Francisco. For nearly 15
years with Thomas Price, as Chief of the Ore-Assay and
Analytical Department. Lessons given in Assaying and
Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering,

Surveying, Architecture, Drawing and Assaying,
728 MARKET ST., SAN FRANCISCO, CAL.

Open all year.

A. VAN DER NAILLEN, President.

Assaying of Ores, \$25; Bullion and Chlorination Assay,
\$25; Blowpipe Assay, \$10. Full Course of Assaying, \$50.
ESTABLISHED 1864. Send for Circular.

HOPKINS ACADEMY,

OAKLAND, CALIFORNIA. A FIRST-CLASS, SELECT
School. Early application needs ary. During year
1891-92, TWENTY-FOUR APPLICANTS were refused
for want of room. Next term begins August 2, 1892.
W. W. ANDERSON, Principal.

LESSONS BY CORRESPONDENCE IN THE COMPLETE THEORY OF

COAL AND METAL MINING,

— INCLUDING —

Arithmetic, Algebraic Signs, Mine Ventila-
tion, Mechanics, Mine Surveying
and Mechanical Drawing.

Students are Qualified

— TO —

Pass any of the State
Examinations.

Pupils Study at Home.

Oldest and Best.

MARKET REPORTS.

Local Markets.

SAN FRANCISCO, April 7, 1892

Business continues disappointingly dull, puzzling the oldest merchant in trade as to the cause or causes. The consensus of opinion among the majority is that to the Railroad Company's high freight charges on goods shipped from this city to local points, can be laid the onus of the present situation, and until they are reduced San Francisco will not gain trans. Up north, the overland railroads are doing all in their power to build up terminal points, whereas, in this State it looks as if the railroad which controls the traffic of this city is doing all in its power to tear down and not build up. To show the extent of railroad construction up north, calculated to develop Oregon and Washington, we give the following from the New York *World and Exporter*. It is expected that the Great Northern will get through the Spokane this summer. Work upon the gap between Puget Sound and the end of its track in Northern Idaho is being pushed rapidly, and through trains are expected to be run from St. Paul to Puget Sound by May, 1893. The Northern Pacific spent \$3,232,800 last year in improvements and extensions in Oregon, Idaho, Oregon and Idaho. Both this company and the Great Northern are contemplating competitive building from Spokane to Ellensburg. The Burlington and Quincy is extending its Chicago, Burlington and Missouri branch northward to Helena, where connection for Puget Sound could be made with the Great Northern, Northern Pacific, or by a line of its own. The Canadian Pacific proper to build through the Rockies a new line which will bring Montreal a day nearer the Pacific. The distance between that city and Vancouver will, it is estimated, be covered in 72 hours. The Canadian Pacific is also understood to be surveying for a number of branches to develop the interior of British Columbia.

The local money market is easy, with the available surplus in the city steadily increasing. There is very little call for funds. This is well illustrated by a decrease of over \$3,000,000 in the bank clearance balances for the last week, compared with the clearances for the like week in 1891. Eastern mail advices report money easy in New York and dull in Boston, with funds at the Clearing House in excess of the demand. The market at Chicago is very easy, the banks having a large surplus which they are doing to in employing. The demand at Kansas City is not sufficient to keep down deposits. There is a large supply of money at St. Paul, with light demand. Money is in light demand and increased supply at New Orleans.

The exports of silver from the port of New York from January 1, 1892, to March 26 have been \$5,601,458 and the imports \$3,339,633. The exports of gold from January 1 to March 26 have been \$5,853,999, and the exports \$12,191,605.

QUICKSILVER—Receipts the past week aggregate 298 flasks, and the exports by sea 197 flasks to Mexico. The market is steady at quotations. The exports from this port during the first three months of the year aggregate 3376 flasks, of which 2100 went to New York, 657 to Mexico, 837 to Australia, 200 to British Columbia, and 82 to Central America.

MEXICAN DOLLARS—Exports by sea the past week aggregate 41,863 to China. The market is dull and heavy at around 69 to 69½ cts. Many dealers are afraid of the market, and only buy to meet current wants.

SILVER—The market at the East and also abroad advanced slightly up to Monday, when a weaker tone set in which was followed by lower quotations. The market moved up and then down, in sympathy with the Eastern market. To-day, private advices report a stronger tone in New York, with certificates slightly higher; but public telegrams report bullion one-fourth of a cent lower. Mint purchases so far in this month aggregate over \$1,000,000, which indicate that the monthly requirement will be secured at an earlier date than last month. The market is very feverish and unhealthy as if manipulators were trying to get quotations down to lower prices; but why, it is difficult to conjecture unless they are buying up securities whose market values hinge on that of silver. It is an open secret that Comstock mine managers prefer silver as a commodity, although they talk free coinage. Our exchanges continue to report silver mines closing at shut. The price of silver is being the only one that Senator Morgan has introduced in the U. S. Senate a bill providing for the free coinage of silver, but confining it to the product of the mines in this country. If it becomes a law, the depositor of bullion, either gold or silver, has the option to take coin or coin certificate. This bill meets a serious objection, raised by many against free coinage without restriction. The principal is in making the one product of the mine the only one that Congress will not act on a free coinage bill at this session, but sometimes legislative bodies surprise all by doing the unexpected.

LIME—Receipts the past week aggregate 1934 bbls. Cutting in prices is reported.

ANTIMONY—The market is easy. New York advices report a weak tone, with quotations the same as reported last week.

LEAD—Pig is firm, with shot higher. Eastern advices report holders firm in their views and rather reserved in their offerings. Consumers and buyers are indifferent operators.

COPPER—The market begins to show more strength, which gives color to the report that a combine is being formed. The consumption of copper in America and Europe shows a steady increase. New York *Iron Age*, March 31, reports that the combine was not an assured success, outside holders and some of the smaller producers manifested uneasiness, while consumers retired, abiding developments, leaving matters somewhat chaotic. The outcome was free offering at reduced prices and a contracted outlet, with Lake Superior iron openly on sale at 12½, and in remote instances, at about 1½ cts less. The best brands followed in the wake and were exceedingly difficult to sell at 1½ cts in other than very moderate quantities.

PIG IRON—The market is reported essentially unchanged. The consumption is free, while the supply is large. Eastern mail advices continue to note unsettled markets, due to a cutting in prices between Northern and Southern furnaces; so far the latter appear to have the advantage.

IRON—The market is strong at full figures. Plate is going into consumption more freely, but as canners and other consumers were supplied ahead, they will not be in the market for a short time. European advices report pig unfavorably affected by the price of silver.

COAL—Imports the past week aggregate as follows: Sydney 3246 tons, Newcastle, N. S. W., 3539, Departure Bay 1232, Nanaimo 2450, Comox 4300, Total 18,732 tons. The market for spot, to arrive and for shipment is still in favor of buyers. The consumptive demand is slow. The tonnage on berth at Australian ports for this city is steadily increasing. As our wheat crop prospects are of the best, it looks as if we will have very low prices for coal for the next 12 months to come.

Mining Share Market.

SAN FRANCISCO, April 7, 1892.

Mining shares the past week hung around blackboard quotations up to Tuesday, when "the short interest" reported by an afternoon paper began to fill, but it was at declining prices which was a decided boomerang to the few bulls on the outside who had been made to believe that much better prices would follow before lower figures obtained. The stock was taken up by the Press of last week, and now that it has come, the writer thinks a sharp upmove is near at hand, when the long who gets out at the advance will have no cause for regret. What the upmove will be made on it is hard to say but it looks very much as if it will be on ore strike in Oregon, Virginia, yet it may possibly be based on having the superintendent of the above mentioned and also the superintendent of Hale & Norcross in filing their reports, conform to the law requiring car sample assays of all ore found. If these assays are given, it will be a long stride in the path of reform and which will do no little in removing the great stumbling block to outside moneyed men operating on the market. Overman has for several months given both car and bullion assays, and it is the superintendent of the mine has gone still farther and gives the width and assay values of all ores found. Bob Morrow who is reputed to control the Overman, may be a shrewd and conscienceless man in stock operations, yet he evidently aims to conform to the law under which the Overman Mining Co. incorporated. Let other mining companies do likewise, and thereby save the dummy directors lawsuits and damages.

Geo. R. Wells, attorney for the Hale & Norcross Mining Co., informs the writer that at the next meeting of the directors of the company a motion will be made and adopted requiring the superintendent of the mine to take and report car sample assays of all ore sent to mill, and also institute other reformatory measures so as to conform to the law. The new management of Hale & Norcross have cut off several supernumeraries, not the least of which is that of Assistant Superintendent (Pendergast's position), who drew \$250 a month. Mr. Wells, as auditor of the company, refused to audit quite a number of bills. The shareholders of the mine are to be congratulated on the auspicious manner in which the new management take solid control of the mine. Mr. Wells says that if they can secure control of the Savage mine then a large saving in milling charges can be made. The Mining Stock Association and the Brokers' Combine, we are informed, will stand in with the Hale & Norcross management, so as to try and have the Savage mine pass into the latter's control. This shows that these two organizations are not actuated by mercenary motives, but by an earnest desire to rectify the abuses on the Comstock brought on through the peculiar system of milling in that district. It now looks as if the new management of the Hale Norcross mine is fretting out many abuses which stand out in bold relief and puts to the blush even the guileless heathen Chinamen. There is no doubt but the uncovering of the various means devised to make money for a limited few at the expense of the shareholders will be instrumental in causing Messrs. Flood and Mackay to have the superintendents of the mines they control conform more rigidly to the law, so as to disarm any adverse criticism and allay any suspicion that "things are not as they should be."

The share market opened firmer this morning, but with trading light. After one of the most advanced slights. The market acts very much like a person recovering from a drunk; perhaps the manipulators are, and, if so, it is to be hoped that when fully sober they will give more life to the market. In outside shares trading continues light, with the Quijotos and Razor Blades sadly neglected. The latter may yet surprise the street by a sudden upmove.

Why should not the new management of Hale & Norcross Mining Co. call a meeting of directors at once and authorize them to instruct the superintendent to give car sample assays, and report all else required by law? It should not surprise any one to learn of suits for damages being brought against the directors of several mines for neglecting to have their agents, the superintendents, comply with the law which requires stockholders to be informed. Until mine managers conform to the law and have their dummy directors require the mine superintendents to conform to the law in making their weekly reports, it seems useless to give favorable news from the Comstock district, for until the reforms demanded are carried into practice the dealing in shares will be a losing game to outsiders, for it will continue to fall into the hands of the few who are in the secret. The mines they are opening up the rich ore found to the west, but not an encouraging word regarding the work is given in the weekly letters. Paid writers and others are attracting attention from mines in which the best results are expected to mines that are more or less worked out; but then, in the latter mines, a strike of ore is taken advantage of to bull outsiders with a false tale that they are better than others. It would not surprise the writer if a strike is reported soon in one or two of the mines.

From the outside mines our advices report that the Silver King mill is being put in place, and that the work in one or two of the Quijotos mines ought to show well soon. In the Bodie district it is said that much of the work which is being done in Bodie and Bodie is kept back, or at least not allowed to reach the public. This work, it is claimed, is quite important. The Mono ore goes nearly \$50 a ton, battery assay; it is gold. The standard letters are very encouraging.

Eastern Metal Markets.

NEW YORK, April 6.—The following are the closing prices the past week:

	Silver in London.	Silver in New York.	Copper.	Lead.	Tin.
Thursday.....	39½	82½	11 75	4 20	19 80
Friday.....	39½	81½	11 75	4 20	19 85
Saturday.....	40½	81½	11 75	4 20	19 85
Monday.....	39½	81½	11 75	4 20	19 85
Tuesday.....	39½	81½	11 75	4 20	19 85
Wednesday.....	39½	81½	11 75	4 20	19 90

Copper is very strong at 11½ cts bid. Borax continues in buyers' favor. Lead is firmer. Pig tin is steady with a fair demand reported. Pig iron is unchanged.

WOOD RIVER—The Queen of the Hills mine, located about one mile from Bellevue, Idaho, was sold a few days ago to an English company with a capital of \$200,000. This property has been in the hands of Salt Lake and New York capitalists for several years past and has paid dividends aggregating a quarter of a million dollars without going beyond 500 feet below the surface. It ceased operations 18 months ago and was placed in the English market for sale. The property is equipped with the finest hoisting machinery and a milling plant, and notwithstanding the prevailing low price of silver it is expected that the mine can be worked with a good margin. The result of the winter's development in the mines in the Wood river region is most gratifying. Some 20 mines in the immediate neighborhood are all showing up well, and despite the deplorable condition of the money market, mining interests are experiencing a great revival.

The discovery of rich gold placers in Sonora, Mexico, is exciting mining circles in Northern Mexico and adjacent territory in the United States. A great many gold seekers are reported going to the country. There is very little water in this region, and water is also scarce leading along the road to the placers. Numerous hardships are reported from prospectors coming in.

California Fish.

At a meeting of the directors of the Mechanics' Institute this week, during

The California Miners' Association.

Officers, Committees and Constitution
and By-Laws of the State
Organization.

As the natural outgrowth of the State Mining Convention, and in accordance with the resolutions of that body, the California Miners' Association has been organized.

The officers of the Association are as follows:

THE CONSTITUTION.

ARTICLE I.

SECTION 1. This organization shall be known as the California Miners' Association.

Sec. 2. The objects of this Association shall be to protect, develop and foster the mining industry of the State of California in all its branches.

ARTICLE II.

SECTION 1. The officers of this organization shall be a President, Vice-President, Secretary, Assistant Secretary, Treasurer, and an Executive Committee, consisting of eleven members elected at large, and one additional from each county represented in the Association, to be selected by the President of this Association.

Sec. 2. All officers to serve for the period of one year, or until their successors are elected or appointed.

Sec. 3. The President and Secretary of the Association shall be ex officio President and Secretary of the Executive Committee.

Sec. 4. There shall be an annual meeting of this Association held in San Francisco on the second Monday in October in each year.

ARTICLE III.

SECTION 1. The Executive Committee of this Association shall have full power to transact all business of the Association, except such as may be transacted at any General Meeting of the Association.

Sec. 2. The President shall preside at all meetings of the Association, sign all drafts and checks authorized to be drawn on the Treasurer, and perform such other duties as are herein prescribed, as usually pertain to that office. In the absence of the President, a Vice-President shall perform the duties of that office, taking precedence in the order of their appointment, unless otherwise ordered by the Association.

Sec. 3. It shall be the duty of the Secretary to keep full and correct minutes of all meetings of this Association, and of the Executive Committee, and shall render annually to the Association a full report of all the transactions of his office; receive all moneys of the Association, paying the same to the Treasurer and taking his receipts therefor, and perform such other duties as may be required of him; either by the Association or the Executive Committee thereof. The Secretary shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

Sec. 4. It shall be the duty of the Treasurer to receive all moneys of the Association, and safely keep the same, and pay the same only upon orders drawn by the President and countersigned by the Secretary. He shall render an annual report to the Association, and upon the request of the President of this Executive Committee, shall, at any time, furnish to said committee, a statement of the condition of the funds of the Association. The Treasurer shall give bonds in such sum as the Executive Committee may determine, for the faithful performance of his duties, such bond to be approved by the President.

ARTICLE IV.

SECTION 1. The headquarters of this Association shall be at the city and county of San Francisco.

Sec. 2. It shall be the duty of the Vice-Presidents of this Association to at once proceed to the formation of a County Organization in their respective counties. Such County Organizations shall be recognized as branches of this Association.

Sec. 3. All persons friendly to the mining interests are eligible to become members of this Association. In the event that there is no County Organization, such person may note with the State Association by forwarding his name to the Secretary thereof, and paying a membership fee of one dollar (\$1.00), upon which he shall be furnished by the Secretary with a certificate of membership. But this shall not constitute him a delegate to the meetings of the Association. County Organizations may admit nonresidents as members.

Sec. 4. Each County Organization shall be entitled to one delegate to the State Conventions for each ten members, to be selected as each County Organization may determine.

This Constitution may be amended at any General Meeting of the Association upon a vote of the majority of delegates present.

Adopted by this Executive Committee, Jan. 22, 1892.

BY LAWS.

SECTION I.—The Executive Committee shall be authorized to appoint from among themselves such subcommittee as they may determine. They shall fill all vacancies of the officers of the Association or members of any committee. The Executive Committee shall have power to remove any officer of this Association who is derelict in his duty, upon a two-thirds vote of all the members present at such meeting, provided that no officer shall be removed until he shall have been notified of the intended action of the committee, and afforded an opportunity to be heard.

Sec. II.—The Executive Committee may, from time to time, levy such assessments upon county organizations as the necessities of this Association may require. Any county organization delinquent at the time of the annual meeting, on account of any assessments levied 90 days preceding such date, may be deprived of representation.

Sec. III.—All parliamentary questions shall be determined in accordance with Cushing's Manual, unless otherwise ordered by the Association.

Sec. IV.—Unless otherwise ordered, the President shall appoint all committees of this Association.

Sec. V.—The meetings of the Executive Committee shall be held at such times as they may determine. Special meetings of said committee may be called by the President whenever deemed advisable, and upon the written request of any five members of the Executive Committee the President shall call a meeting thereof.

Sec. VI.—At all meetings of the Executive Committee seven members shall constitute a quorum for the transaction of business. Whenever practicable, each member of the committee shall be notified personally or by mail of each intended meeting.

Sec. VII.—The Secretary and Treasurer shall receive such compensation for their services as this Executive Committee may, from time to time, determine.

These by-laws may be amended at any annual meeting of the Association, upon a vote of the majority of delegates present.

Adopted by the Executive Committee Jan. 22d, 1892.

The headquarters of the California Miners' Association have been established at room 23, No. 331 Pine St., S. F., Stock Exchange Building.

Assessment Notices.

KEYSTONE CONSOLIDATED MINING COMPANY. Location of principal place of business, San Francisco, California. Location of works, Amador City, Amador Co., Cal. Notice is hereby given that at a meeting of the Board of Directors, held on Wednesday, the 9th day of March, 1892, an assessment (No. 2) of Two Dollars and Fifty Cents (\$2.50) per share was levied upon the capital stock of this corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 310 Pine St., room 43, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of April, 1892, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Monday, the 9th day of May, 1892, to pay the delinquent assessment together with costs of advertising and expenses of sale.

By order of the Board of Directors, J. H. ISHAM, Secretary, Office, No. 310 Pine St., Room 43, San Francisco, Cal.

GOVER MINING COMPANY.

Notice of Annual Meeting of Stockholders.

THE ANNUAL MEETING OF THE STOCKHOLDERS of the Gover Mining Company will be held at the office of the company, No. 13 and 15 Fremont Street, San Francisco, California, on TUESDAY, the Tenth day of May, 1892, at 1 o'clock P. M. of that day, for the purpose of electing five Directors to serve until the next annual meeting and until their successors are elected and qualified, and for the transaction of all other business that may be brought before said meeting.

By order of the Board of Directors, ROBERT MCF. DOBLE, Secretary.

BOOKS ON ASSAYING.

By C. H. AARON.

Part I.—Gold and Silver Ores.

SECOND EDITION—PRICE \$1.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in each plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more voluminous and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay; Preparation of the Ore; Weighing the Charge; Mixing and Churning; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assays; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ores Containing Coarse Metals; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expeditious; Assay Tables.

This volume embraces 130 litho. pages, with illustrations, well bound in cloth; 1889. Price, \$1, postpaid. Sold by DEWEY PUBLISHING CO., Publishers, No. 220 Market Street, San Francisco.

Parts II and III.

Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Etc.

SECOND EDITION—JUST OUT.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Gay Lussac's Method; Volhard's Method; Manipulations; Lead Ores; Copper Ores; Tin Ores; Mercury Ores; Zinc Ores; Nickel and Cobalt; Chromium; Bismuth; Arsenic; Antimony; Sulphur; Salt; Note.

One of the methods given for the Assay of Copper is new, original and exact, as is also one of the processes for Zinc. This book contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter.

Price, postpaid, \$1.75. Sold by DEWEY PUBLISHING CO., Publishers No. 220 Market St., San Francisco.

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flange or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will leave a higher percentage of sulphurets.

FRENCH OULCH, Calaveras Co., Cal., Dec. 12, 1891.
 My experience in mining and milling, I have used twenty-four
 silver. I have made competitive tests against them with other
 place. When I built this mill (20 stamps), I determined to put
 ning four of your six-foot machines and they have been going for
 ul-timum of fifty tons per day, and do better work than the four-
 san is at least twice the quantity of ore. I have run them up to
 nd start as easily as the smaller tables and have the advantage
 no more oil, and no more wear and tear than the smaller tables.
 In order to give an idea of the work they are doing here I will
 lings from nothing to 60 cts. per ton. I will conclude by saying
 only table that I would have in my mill.

als, call on or address us at our office.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the
 "Triumph" Ore Concentrators, the "Frue" Vanners and
 other forms of concentrating devices, do not warrant the as-
 sertion that the "Frue" Vanner is the best ore concentrator in
 the market. The fact that the "Frues" have improved (cor-
 rugated) belts does not militate against the superiority of the
 "Triumphs;" for, when desired, they (the "Triumphs") can
 be mounted with a superior belt known as the "Blasdel"
 Riffled.

Price "Triumph" Concentrators, with Im-
 proved (Patented) Belt - - - \$650 f. o. b.
 Price "Triumph" Concentrators, with
 Plain Belt - - - - - \$550 f. o. b.

We are prepared to guarantee the superiority of the "Triumph" over
 the "Frue" or any other form of Concentrator, for coin it need be.
 Circulars and testimonial letters furnished on application.

GRASS VALLEY, NEVADA CO., CAL., NOV. 10, 1885.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph"
 Ore Concentrators, that four (4) of them were placed in the mill of the
 Original Empire Mill and Mining Company in April, 1884, and a thorough
 test made of their practical operation; and their efficiency having been
 demonstrated, four (4) more were subsequently introduced as the comple-
 ment of the Twenty (20) Stamp Mill, and the eight (8) have been and are
 now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under
 my supervision, four (4) are also in successful operation, and from my
 observation of their practical workings, I am convinced that this form of
 Concentrators is the equal, if not superior to any other style of Vanners
 or concentrating devices.

Signed] Supt North Star and Original Empire Mining Co.
 N. B. When the stamping capacity of the two above named mills was in-
 creased, more "Triumph" Concentrators were purchased, and twenty-
 eight (28) are now in constant successful operation.

Montana Copper Ore.

In a paper on "The Copper Resources of the United States," read by James Douglass of New York before the American Institute of Mining Engineers, the author states that the principal mines of Butte, Montana, have been opened on a lode which has proved to be continuous and productive for over three miles. The principal mines succeed one another from west to east as follows (see engraving): Gagnon, Original, Parrott, Anaconda, St. Lawrence, Mt. View, Shannon, Colusa and Hattie Harvey. The gangue of the vein is granitic and softens to a very considerable depth. It contains disseminated particles of ore, but most of the ore is derived from large imbedded masses. One of these in the Anaconda is said to attain a width of 150 feet of solid mineral. Two, or perhaps three, parallel veins, or as many chains of ore masses in one very wide vein, are traceable throughout its extent. Everywhere the copper carries silver in proportions varying from two ounces per unit of copper to less than one-half ounce per unit. The proportion of silver to copper is greater in the western section of the vein than in its central and eastern sections. The ores of the Gagnon mine are smelted into rich argentiferous matte at the Williams Works, which ship their product to the Boston and Colorado Smelting Company of Argo, Colorado. The Parrott ores contain about sixty ounces of silver to the ton of copper. The average silver contents of the Anaconda, Mountain View and Colusa ore is less. Both the Chambers Syndicate and the Boston and Montana Company, however, make rich silver matte, but not from unmixed ores of the great lode.

In the Gagnon and Original on the west and Colusa on the east, the copper ore came to the surface, whereas in the Anaconda and Mt. View, which crown the hill several hundred feet above the terminal mines, the surface ores, to a depth of 400 feet, carry some silver but no notable quantity of copper. At about

that depth, however, great bodies of oxysulphurets and erubescite were met with in the Anaconda, from which, in the early days, ores running 50 per cent and over in copper were mined by tens of thousands of tons.

in the valleys and on the flanks of the hill. But their depth and richness there are not as great as they are on the summit, where it seems as if the copper leached out of the 400 feet of depleted vein had been concen-

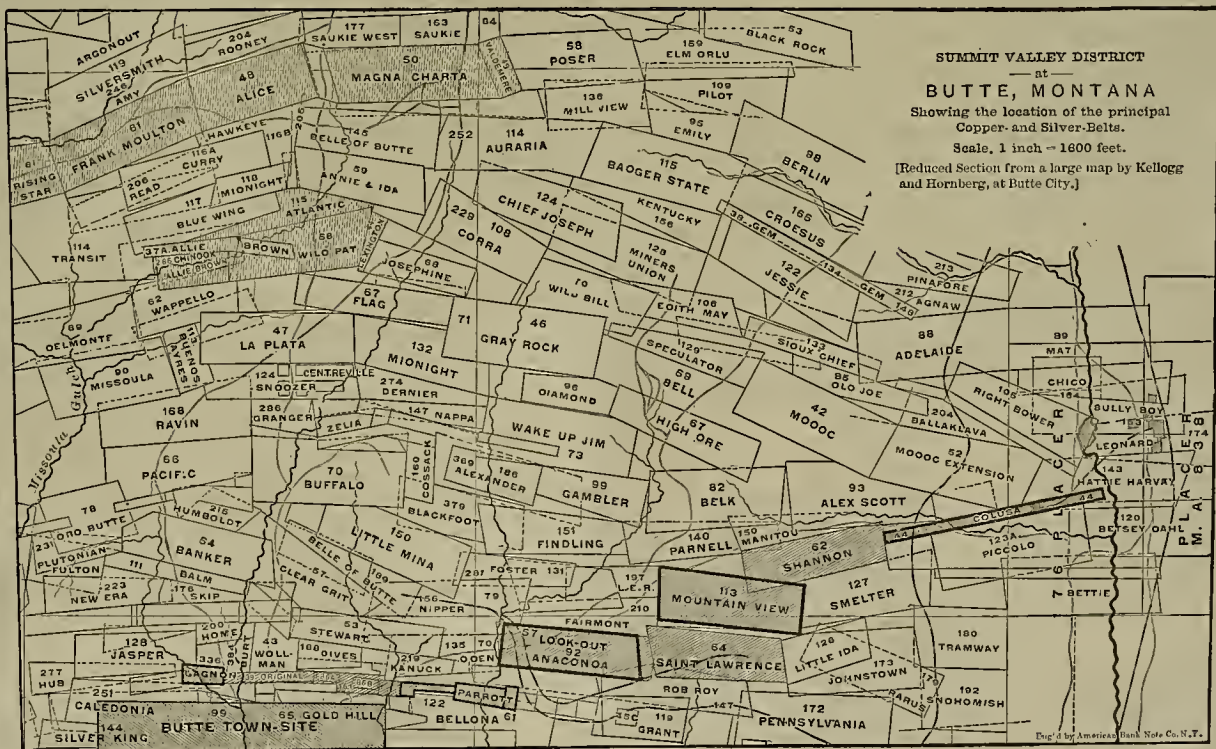

LEFFEL'S DOUBLE STANDARD TURBINE MINING WHEEL.

The Leffel Mining Wheel.

The Leffel standard double water-wheel for mining purposes is mounted on an iron frame as shown. There is on this wheel a combination of two independent sets and kinds of buckets, one a vertical and the other a central discharge, each entirely different in its principle of action upon the water, yet each wheel or series of buckets receiving its water from the same set of guides at the same time. The water, however, is acted upon but once, since half the water admitted by the guides passes to one wheel and the other half to the other, being nicely divided and separated by the partition or diaphragm between the two wheels, the water leaving both wheels or sets of buckets at the same time and as quickly as possible. These two sets of buckets are so combined as to make really but one wheel; that is, both are cast in one piece and placed upon the same shaft. By this arrangement there is admitted the greatest volume of water, to a wheel of any given size, consistent with its economical use, at both full and part gates, and at the same time the greatest area for the escape

of water is secured. The surface on the wheel is thus reduced to a minimum as compared with the quantity of water used. There are a good many thousands of the Leffel wheels in use in the various industries, the type shown being especially adapted for mining purposes.

CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eo.

Car and Battery Sample Assays.

BODIE, CAL., April 9, 1892.

TO THE EDITOR:—In your issue of March 19th I note I am taken to task in your "Mining Share Market" column for failure to report car or battery sample assays "as required by law." The Civil Code reads as follows: "It shall also be the duty of the superintendent to file with the Secretary a weekly statement, under oath, showing * * * the amount (of ore) sent to mill for reduction, its assay value, the amount of bullion received," etc.

I do not find anything about car or battery sample assays. In the case of the Standard ore, neither of these would comply with the law, which demands the assay value of the ore, not an assay value, such as car or battery samples would furnish.

Over 60 per cent of the value of the ore from the Standard mine consists of free gold, while nearly 90 per cent of our entire product is obtained from the batteries and apron plates. Consequently a battery sample will not give the assay value of the ore, as an unknown quantity of coarse gold remains inside the mortars. Neither will a car sample do so, not only on account of the difficulty of getting an average sample from coarse and fine rock mixed in unequal proportions, but because of the absolute impossibility of getting a representative sample of a free gold ore existing in that state. How, then, can the assay value of the ore be arrived at?

Only by adding together the value of the bullion product of the batteries and apron plates, the value of the concentrates produced from our Frue vanners and the value of the escaping tailings, which latter can be accurately determined from daily assays, as the element of danger in sampling—the free gold—is eliminated. This sum, divided by the number of tons of ore crushed during the month, gives the true assay value of the ore. Of course this can be done but once a month after the regular cleanup, and I inclose you a copy of our mill report for the month of January last, showing the form in which this information is put before the stockholders. This complies with the spirit as well as the letter of the law, and gives accurate and not misty information.

THOS. H. LEGGETT,

Pres. and Manager Standard Con. M. Co.

The January statement of the Standard Mining Co. is a decided improvement on the reports furnished by any other mine, either in the Bodie or Comstock district, and Mr. Leggett deserves credit for the concise manner in which he gives the bullion output. It is to be presumed that the company own their mill, but aside from this the Superintendent is not expected to construe the laws of California nor to withhold from shareholders any knowledge to which they are entitled to under the law. The weight and assay value of the ore as sent from the mine to the mill is as important knowledge for shareholders as it is to the man or men who manage the mine, and it is the superintendent's duty as an agent for those who have entrusted him with their property to keep just such a check and to notify them of that fact, in order that they may know if he is performing his trust in good faith. Superintendents are in the employ of the shareholders whom they represent, and they have a duty to perform, and that duty is to report the facts as they exist—that is, to give the weight and assay value of the ore which passes through their hands as superintendent. This is the more important when the mill is not owned by the mining companies.

To understand this position more clearly it is necessary not only to quote that section of the law referred to by Mr. Leggett but to explain why the law was enacted.

The Act of March 30, 1874 was amended April 23, 1880, and made to read as follows:

Section 587, Civil Code, Section 1: It shall be the duty of the Superintendent to file with the Secretary a weekly statement, under oath, showing the number of men employed, etc. * * * He shall attach to such account a full and complete report, under oath, of the work done in said mine, the amount of ore extracted, from what part of the mine taken, the amount sent to mill for reduction, its assay value, * * * It shall also be his duty to forward to the office of the company a full report under oath, of all discoveries of ores or mineral-bearing quartz made in said mine, whether by hor-

ing, drifting, sinking, or otherwise, together with the assay value thereof. * * *

This amendment was introduced by Senator Felton to correct the abuse of the Comstock mill ring.

The mines were owned by shareholders in California while the mills were owned by a mill ring in Nevada, and the mine had no check upon the mills except through car sample assays taken at the mine previous to shipping. The amendment was made to the act of March 1874 to compel superintendents to keep a record of the ore (number of tons) sent to the mills and its assay value, to be used as a check against the mills. Again, superintendents were, by this amendment, forced to report all ore found in the mine and its assay value as a further check against mill owners in making their returns to the mining companies for which they were milling ore.

The Comstock mill ring, which also controls the mines through dummy directors, has persistently refused to obey the law requiring the filing of the assay value of the ore at the mine, and instead, have simply furnished the mining companies with the pulp assay of the mill. These pulp assays have been made to order by the mill ring, and in many instances have been so manipulated that the mine has received less than 50 per cent of its assay value and in one instance not more than 35 per cent.

In early days on the Comstock the mining companies hoisted their ore, had it sampled and sold it to the mills for 65 per cent of its assay value. To day the mills are owned by one party and the mines are owned by everybody. The mill rings buy the proxies of brokers, elect dummy directors, and these directors hire a superintendent, like the one at the Hale & Norcross, who turns the ore over to the mills without any check whatever. The president of the mine, like the ex-president of the Hale & Norcross, is given certain profits to keep his mouth shut and as a result they return about 50 per cent of the value of the ore to the mine.

To correct just such abuses as the above, the Felton Amendment was enacted, and had the superintendent of the Hale & Norcross been forced to report his mine and car sample assays to the stockholders in San Francisco, at least one million dollars would have been paid in dividends in place of being carried off by the mill ring.

The ex-president of Hale and Norcross says the law means pulp assays of the mill taken by employees of the mill ring. How could the superintendent get a pulp assay of ore "discovered" by boring, drifting, sinking, or otherwise, when only a small sample is sent to the office of the assayer from the drill borings, or a few selected samples taken from across the face of a drift? The law is plainly written, and its object has been explained. By evading it, the stockholders of Hale & Norcross were robbed of \$10 per share, which should have been paid in dividends.

Trans-Sierra California.

A Land of Contrasts and Extremes.

SAN FRANCISCO, April 9, 1892.

TO THE EDITOR:—What has come to be known as, and very properly designated, Trans-Sierra California consists of that portion of the State lying beyond the Sierra Nevada mountains, and extending from the summit of that range northeast to the State of Nevada. It is a region of imperial dimensions, being fully 160 miles long by nearly 100 wide, comprising an area of 25,000 square miles—16,000,000 acres.

This outlying country is marked by many physical peculiarities, both climatic and geographical. Here, with a single exception, are found the highest mountains, also the lowest lying lands in the United States. Standing on the western border of this Trans-Sierra is Mount Whitney, having an altitude of over 15,000 feet, with a dozen other peaks in the neighborhood nearly as high, while over close to its eastern margin lies Death Valley, depressed far below the level of the sea.

Certain other conditions here contrast

quite as strongly. From the higher mountains, snow never disappears; in the deeper valleys it is seldom, if ever, seen. On the former, the climate even in summer is arctic; in the latter semitropical, almost torrid, the banana ripening in sight of the eternal snow-fields. The water flowing down the canyons is the purest in nature, while that found in the lakes is impregnated with the chloride of sodium and other salts to a degree that renders it unfit for use. The soil, with irrigation, produces abundantly, whereas without this aid, nothing can be grown. One can pass from the extreme of fecundity to the extreme of sterility—out of Paradise into Edom—in a single step. This is the land of the illusive mirage, the blinding sand-storm and the mephitic pools—the land of tempests and calms, of lone buttes, alkali flats and mud lakes—treacherous, bewildering and full of the paths that lead to death.

THE MOUNTAIN SYSTEM OVER THERE

Consists of two principal chains—the White and the Inyo—with many isolated peaks and groups scattered about in every direction, the Sierra Nevada towering a great wall on the west, this like the two main ranges having a northerly and southerly trend. The height of these interior mountains above the great plateau which constitutes the general plane of the country, varies from 2000 to 6000 feet, this plane itself being elevated from 3000 to 4000 feet above tide water. The southerly half of the Inyo takes the name of the Coso mountains, which reach south to their junction with the Slate Range of San Bernardino county. The White mountains lie east of and lap on to the Inyo range, whence they extend north into the State of Nevada. The upper portion of these mountains is composed of a disintegrated rock bleached white as snow—hence the name.

The scenery in that section of the Sierra Nevada situated along and partly within this outlying district is grand beyond description, some of the precipices here exceeding in height any that wall in the valley of the Yosemite. Canyons are met with in this more than Alpine region deeper far than that awful gorge. There occur here waterfalls as lofty as any seen elsewhere, natural bridges spanning great chasms, dark and cavernous alcoves, the craters of dead volcanoes, splintered peaks standing up like church spires, and living glaciers, ever moving but making no progress, these cold and far-removed mountains being the seat of a desolation more absolute than that which reigns over the hot and low-lying deserts to the east.

ITS HYDROGRAPHY.

There is found in this region but a single stream of any magnitude—Owen's river, which traverses more than half its entire length. This river, during the time the snow is melting on the mountains adjacent, carries a large volume of water, much of which is now used for land irrigation. It is fed by numerous tributaries flowing from the Sierra on the west, the mountains to the east affording but little water. There are two considerable lakes in this district—Owen's, a shallow sheet of water 20 miles long and 10 wide, and Mono, 100 miles farther north, covering about the same area but very deep. Nothing can live in either of these lakes, owing to the impurity of the water.

Besides these two bodies of water, there occur here the beds of ancient lakes, now dry or nearly so, these being the sites of the borax deposits and other salines, the most of which are being worked in a large way. To certain of these low basins has been applied the term "sink," because here do the streams that make into them sink and disappear, the water they carry being absorbed by the porous earth or dissipated by the arid and heated atmosphere that for two-thirds of the year here prevails. What is left of these lakes is supposed to be nothing more than the remains of the inland sea that formerly covered this country far and wide, the tops of the present mountains appearing then long and straggling islands in its midst.

TIMBER AND AGRICULTURAL LANDS.

The only lumber forests met with in this country stand on the Sierra Nevada mountains, which from summit nearly to base are covered with a heavy growth of pine. On the mountains to the east only, a scattered growth of pinion juniper and mesquit is found, these all being scrubby trees. Elsewhere, there is no timber of any kind, the few cottonwoods that originally grew along some of the streams being now all cut away. By reason of this scanty forest growth, both lumber and fuel are apt to be dear, no mineral coal of any account having yet been discovered in this country.

About the only land available for tillage consists of the Owen's river bottoms with narrow strips along some of the other streams. A great deal of the soil elsewhere

is rich, and would produce good crops of both fruit and grain could water be had to irrigate it. With sufficient moisture, whether supplied naturally or artificially, nearly everything can be cultivated with success, some astonishingly heavy crops having, under these conditions, been raised. The wild grasses grow sparsely on the mountains and deserts, and luxuriantly on the bottom lands, these grasses furnishing altogether a good deal of excellent pasturage. Concerning the mineral resources of this Trans-Sierra, something will be said at another writing.

H. DEGROOT.

Early Hydraulic Mining.

The First Introduction of Black Iron Pipe.

SAN DIEGO, April 9, 1892.

TO THE EDITOR:—Having read with great interest the article in the MINING AND SCIENTIFIC PRESS of Jan. 30, written by J. F. Talbott, on the early introduction of hydraulic mining in California, I thought my own experience in that line might be of some interest to your readers. I think Mr. Talbott is correct about the date of its introduction, 1853-4; and as soon as it became generally known that dirt could be rapidly moved by the force of water under pressure, everybody that could get water on their claims for that purpose did so. They used common duck hose, made of No. 1 or No. 2 duck, the canvas being 22 inches wide, made after taking out the lap for sewing, a hose about seven inches in diameter, which was used, as near as my memory serves, for nearly two years. For discharge pipes, various kinds and sizes were used, principally made of Russia iron, usually two thicknesses, some long and slim, some short according to the fancy of the person using them. And by the way, this reminds me of a man calling at my shop, in the town of Red Dog in Nevada county, and having in his hand a pipe, about three or four feet long, made of Russia iron; one end, one and a half or two inches in diameter, and four or five inches at the other, which he said he got made at Mr. McLauchlin's shop in Grass Valley. He was on his way to Indiana Hill where he was engaged in mining. I don't know who it was unless it was Mr. Talbott, as I have no recollection of ever seeing the man, before or since.

THE CANVAS AND IRON.

About the year 1855 or '56 I was running a tin-shop in the town of Red Dog, and also engaged in hill mining. There came to me at that time two men from Waukegan, by the names of A. Curry and Thomas McAuliff, the same A. Curry of the famous Gould and Curry mine in Virginia City. They wanted to ascertain the cost of making about one hundred feet of seven-inch iron pipe, of common black iron, and told me what they wanted it for. They had been talking the evening before, in the McAuliff residence, as to what plan they could adopt to prevent their hose bursting so often, when Miss Margaret McAuliff, a sister of Thomas, spoke up and said, "why would not such a thing as that do," at the same time pointing at the stovepipe. The idea struck them at once that that was just the thing they wanted. I went to work and made them their pipe of No. 22 iron, riveting it instead of grooving as is common in making stovepipes. They laid their pipe down the slope of the hill, and drove stakes over it to keep it in place, and then drew their hose inside of it. The object was, to have the iron receive the strain of the pressure of water, and the hose would make it tight, so as not to leak. They found it worked to their entire satisfaction, but after using it a month or two, the iron began to rust, and destroyed the fiber of the cotton hose, and it began to come out in pieces and finally all came out.

I then made them a tapering joint of pipe to put on the lower end to attach the hose to, as they had found that the sediment in the water had filled the joints of the iron pipe so it was perfectly tight, and it was used some time after.

INCREASING SIZE OF PIPE.

When I saw the iron worked so well, I went to work to fit up my own mine with iron pipe, but enlarged upon it by making it 11 inches in diameter and of No. 20 and 22 iron. The heavy iron I put below and the lighter above, then riveted the joints together in sections about 16 feet long, putting them together with slip joints and riveted hooks on each end of the sections, so as to wire them together to keep them from slipping apart.

In order to make it water-tight, I took old hose, cut it in strips two inches wide, and riveted it in all the joints. I also divided the pipe at the lower end, so as to run two hose from the one pipe; and, having

about 90 feet fall, it worked with good results, and people used to come from different sections to see it working.

This, I believe, was the first introduction of black iron pipe for hydraulic mining in California. I had heard that some one had made a seven-inch pipe of galvanized iron and soldered it to make it tight, but it was very expensive in those days for most miners to use. After putting up my pipe, I had all the work I could do making that kind of pipe, but it was soon found out that it was not necessary to put the canvas in the joint, as the sediment in the water soon stopped all leaks that happened to be in the seams.

THE IMPROVEMENTS.

From then on to the time hydraulic mining was stopped by the courts, the miners went on improving with larger pipes, higher fall, thicker iron, with cast iron distributors to run three and four hose from, until they finally seemed to have settled on what is called the Little Giant, which has a universal or knuckle joint to it and a lever attachment to move it about in any direction without the use of any hose whatever, and having a nozzle from four to six inches in diameter, or large enough to run all the water for the sluices through one discharge pipe.

Thus hydraulic mining has advanced step by step from its first inception by Mr. Talbott's simple way of working off loose dirt to its final perfection, when hydraulic mining was stopped by the courts.

THE FIRST DITCH.

There is one thing in Mr. Talbott's communication wherein I think he is a little behind the times, and that is in regard to the first ditch that was constructed for the purpose of hill mining. He speaks in a former communication to this paper of the first discovery of gold in the ancient river channel, or what is termed the blue lead, as having occurred at Yankee Jim's, in Placer county, in the summer of 1851. That statement is entirely correct. When I went to Yankee Jim's in October, 1851, in going from Owl creek to Yankee Jim's, the trail led directly over the claims located by a party of Georgians, who first made the discovery, and they called it Georgia Hill. The discovery was made in this manner: They had been working in Devil's canyon, which was a deep and narrow ravine, and it paid very rich up to a certain point, when it ceased to pay. One of their number discovered on a bench about 50 feet above the bed of the creek, where a sugar pine tree had blown over by the roots, a bed of washed quartz gravel. He took a pan of it down to the creek and washed it out, and, if my recollection serves me, he told me he got 50 cents out of it.

They prospected farther, and found it very rich. They then went to work and split up the old pine tree into slabs and made a chute of it and run the dirt down to the bed of the creek and washed it in a long Tom. That they were doing when I arrived there. They were also working on a ditch to bring the water of Devil canyon down on the hill. I immediately hired out to them to work on the ditch at \$6 a day, and worked until the ditch was completed. This, I think, was the first ditch completed, as the Bear River ditch was not completed until the following summer of 1852. There was another ditch dug that same season from Devil's canyon, on the opposite side, to work the Strong diggings, above the town of Yankee Jim's, and other claims. In the summer of 1852 two other ditches were brought into Yankee Jim's from Brushy canyon.

TRACING THE CHANNEL.

From the first discovery under the roots of the old pine tree on Georgia Hill, the lead or channel was traced north across Devil's canyon to Strong's Hill, thence through the hills to Shirt-Tail canyon, which cut it away entirely; but on the opposite side, at King's Hill, it was taken up again and traced to Elizabethtown, Wisconsin Hill, Iowa Hill. There it was cut off again by the North Fork of the American river, a much larger stream than the others, and cut down to a depth of about 2000 feet below the ancient channel.

It was again found on the north side of that stream, at Indiana Hill, where our friend Mr. Talbott says he worked. From there it was traced to Gold Run, Dutch Flat, Eastman Hill, across Bear river to Little York, across Steep Hollow to Brown's Hill, thence to Red Dog, Independence Hill, across Greenhorn creek to Hunt's Hill Quaker Hill, and through the divide to Deer creek, but that stream was too shallow to cut the channel away, and it was never worked much there for want of drainage; but it continues on through the divide between Deer creek and the South Yuba, where it was discovered at Relief Hill. It then

crops the South, Middle and North Yubas to Galena Hill and Comptonville.

Beyond that, I am not familiar enough with the country to name the places, but have no doubt that it crosses all three of the branches of Feather river, and perhaps still farther north. In going south from Georgia Hill, it runs through the Divide, cropping out again at Todd's Valley, crossing the Middle Fork of the American river and making its appearance again at Bottle Hill, in El Dorado county. Beyond that, I shall have to leave for others to trace, as I am not familiar enough with the country to determine; but in all that distance from Bottle Hill to Comptonville it has every appearance of being one continuous channel or ancient river bed, running a little diagonal across the present rivers nearly north and south, being higher in the mountains to the north and trending toward the valley at the south.

CHARACTER OF THE GOLD.

The gold in that distance is almost all of the same character and quality, being mostly scale gold, with the exception of some coarse pieces found on the bedrock, and it nearly all goes from 930 to 945 in fineness. Then the bowlders, sand and gravel are nearly all of the same nature and differ entirely from the hill deposits farther up in the mountains toward the summit, or lower down toward the foothills; and as evidence of this channel having had a current running from north to south, every hydraulic miner who has worked on this channel knows, if he observed it, that in piping to the north the bank will always bang over at the top before caving, whereas in piping to the south, the caves will slide off from the top first, showing the shingle to be down stream to the south, the same as it does in all running streams.

Along this whole line of channel, mining has mostly been done by hydraulic process, and millions of dollars have been extracted, and I venture to say that not one-third of it has been taken out.

THE BLUE LEAD.

Many of your readers might be interested to know why this ancient river channel is called the "blue lead." It comes about in this way: In the divides or ridges between the present rivers, the deposit of the ancient river crops out on the bedrock, below which the present streams have worn it away; then rises back to the top of the divide, making the deposit from nothing to four or five hundred feet in depth. Now, as the present streams go on wearing down the bedrock, as it has for ages and ages, it becomes exposed to the action of the atmosphere; the minerals in the rocks become oxidized and cause the rock to expand, like putting lime into a barrel—as soon as the atmosphere begins to work upon it, it swells and bursts the barrel. So with this bedrock; it swells up, and there being little or no weight of the divide upon it to hold it down, it forms a rimrock in front of all these deposits; or, in other words, a basin is formed in under the mountain, so that in many places the miners have to run long tunnels through this rimrock to drain this basin and work the rich deposits under the divide, which is invariably found to be of a *skyblue color*. This blue gravel never is known to extend higher up from the bedrock than the height of the rimrock, or to where the water has no chance to drain out, and all sand and gravel above this basin of water is invariably of a reddish-yellow color, showing conclusively that the iron in the gravel deposits above the water line has been oxidized by the atmosphere, which has given it its red color.

I have seen places where this line of distinction is so marked that a bowlder the size of a man's head would be one-half blue and the other half red. And I have seen pot holes in the bedrock, not over a foot deep, filled with blue gravel and all above it red. This occurred where there was but very little rimrock. The ravines were shallow and the gravel deposit not very deep. I have also noticed where water from the blue gravel, in running out through sluice boxes or tunnels, on coming in contact with the atmosphere, soon a coating of red iron rust will be formed on the bottom of the sluices and tunnels.

WM. A. BEGOLE.

ANOTHER APPOINTMENT AT STANFORD. William H. Hudson, assistant librarian of the Cornell University, has been appointed assistant professor of English literature in the Leland Stanford Jr. University. Mr. Hudson is an accomplished man of letters. As the private secretary of Herbert Spencer he had for some time an opportunity to see literature in the making, having been brought into somewhat intimate contact with many of the most distinguished men of letters in England.

On the Magalia Ridge.

The Magalia Ridge, Butte county, says the *Oroville Register*, has been suddenly awakened from its Rip Van Winkle sleep by a little "boomlet," as it were, which came a few months since to prepare it for the great big boom that is inevitable, and must be close at hand. It would seem that the spirit of improvements, developments and changes constantly occurring everywhere in the State but here, has at last stirred up the people at this point. The ball opened last fall when Steve Moody of Mineral Slide "struck it rich" after many months of labor and perseverance. The history of this property is not unlike hundreds of others with various ups and downs. It has paid more or less since 1882. In 1889 Moody took it in hand, running a 1000-foot tunnel. Didn't pay the owner a cent, consequently didn't pay the labor. Leins were filed and a general stampede occurred, except Mr. Moody with his usual pluck and nerve. Gathering up his forces he took heart and pick and shovel, and after various reverses was at last rewarded with handsome pay. Compromising with the creditors and owners, he remained in "the deal," and is again at the front, although threatened a few weeks since by a landslide, which stopped the works. This deposit lies on sand bedrock, adjoining the slate. They are now drifting in at new points, with large crew and handsome results. The gold is coarse and smooth, indicating plenty more where that came from.

The Eureka, located at the junction of the Little and Middle Butte, was stricken with a sort of financial la grippe, which raged in this district some three years ago. They are, however, prospecting now in quartz on this property, with fine showing. The vein matter yields from a nickel to two dollars per pan in free gold. On the strength of this, parties interested are negotiating a speedy settlement of difficulties in order to go ahead in a business-like manner.

The Bader Bros. have bonded their mine to a Mr. Hendricks of Chico. This property lies on the Little Butte about a mile south of Magalia. It has paid the owners for years past, and only recently, in sluicing out the old tunnel, several nuggets were found weighing from \$5 to \$20.

Just across from the Bader Camp on West Branch, parties are industriously running a tunnel into a quartz ledge with very flattering prospects.

Some stir, denoting that life is not wholly extinct, has occurred recently on the Berdan ridge over near the Humboldt road. A large party of surveyors, headed by that able engineer, McCoy, have been for six weeks staking out new lines at the Dix mine. South of this, on the west side of the Big Butte, lies the Best mine. At present they are working the tailings and are well rewarded.

Just above the forks of the Butte we find Peter Woods and assistants working a huge bank of tailings. If these pay but a small percentage of the past output of the mine, they are doing well. At the Queen mine, farther up the Big Butte, the owner is engaged piping at two places on the bar with good results. This mine has a fine quartz ledge also running through it only waiting for development. At Portuguese Point, opposite the Dix, Sol Petit is engaged cleaning out the old tunnels and putting sluices in order for drifting. Mr. Petit is a man of good judgment and believes fervently in luck, which he recently illustrated by stubbing his toe on a \$55 nugget while cleaning out a sluice box.

MINERALS IN BUTTE.—There is a greater abundance and variety of minerals found in Butte than most readers are aware of. Gold was found here at an early day, being preceded only by the discovery at Coloma by Marshall. The vast output from this county is estimated at hundreds of millions. Silver has been discovered in the high region known as Gravel range, and many tons of ore have been worked, demonstrating that valuable lodes of silver ore exist there. Coal has been discovered in a number of localities, notably at Table Mountain, and lately upon the land of Mrs. McCain, west of that mountain. Asbestos is very plentiful in many mining districts, and especially so about Forbestown. Soapstone, valuable for a number of purposes, has been found on several of the mountain ridges. No finer marble in the State can be shown than the deposits on the middle fork of the Feather river, and on Marble creek near Merrimac mills. A large deposit of excellent iron ore is found near Wyandotte. A large bed of superior chrome iron lies near Magalia. Granite, excellent deposits of fine clay suitable for pottery, and sandstone are abundant.—*Oroville Register*.

The Miners Should Be Aided.

The Miners' Association has appealed to San Francisco for aid. The expenses of the Association have been very heavy, and while most of the counties immediately affected have given aid, the metropolis is not less interested. If the mining now prohibited can be resumed under the system suggested by mining and by Federal engineers, then San Francisco will be greatly benefited in having that resumption made practical at the earliest possible day. It is entirely proper, therefore, for the miners to appeal to the metropolis for assistance. The success they have attained in securing official recommendation that \$450,000 be appropriated by Congress for construction of works, advised by the engineers, is very encouraging; but the bill is a long way from passage. The Miners' Convention Committee must remain in Washington until the bill is passed or refused passage, and it must continue to urge the measure upon the attention of Congressmen individually, and to use all legitimate means to command respect and an early place for the bill. The committee cannot be maintained in Washington without liberal means, and to the furnishing of them the metropolis of California ought to contribute, since that city has a great deal at stake in the matter. The revival of the mining industry means much to her, and she should labor and contribute to secure that end. The chief work to be done in the matter is to be accomplished before the bill comes up for consideration. To inform and convince Representatives and Senators, there must be laid before them in detail and persistently all the arguments used before the committee. This involves the use of much printed matter, employment of much clerical labor and the tabulation of statistics and their analysis, all of which cost money. The committee ought to have generous aid from San Francisco, therefore. The mining counties are already giving all they can, and the river counties tax themselves heavily for a work equally as important—the conservation of the navigability and drainage capacity of the rivers.—*Sacramento Record-Union*.

SMOKELESS POWDER IN RUSSIA.—It is reported that the factory which was established some ten months ago in St. Petersburg by Frenchmen, with the view of manufacturing smokeless powder according to the French method, has been declared by the Russian Government to be of no further utility, the powder having failed to give satisfaction. The factory has therefore been closed and the French workmen have been paid off. At the same time a new contract for the supply of 800,000 pounds (of 36 lbs.) of smokeless powder has been concluded with the Schlussemburg Powder Company (Schlussemburg is a small town 21 miles east of St. Petersburg) at the price of 60 roubles (£9 10s.) per pound, the total amount of the commission being accordingly 48,000,000 roubles, which sum, it may be mentioned, was not taken into consideration when the last Budget was issued. The Schlussemburg powder will be manufactured according to an earlier recipe.

OUTLOOK IN NEW MEXICO.—The *Silver City Enterprise* says: In a number of camps of lesser note throughout the county, prospecting work is being vigorously prosecuted, and several shipments have been made which proved satisfactory. Several of the camps have received a setback by reason of some of the mines being closed down through litigation, but in their own proper time they will again come to the front and be heard from. In conclusion during a residence of 13 years in Grant county, never, in our estimation, was the outlook more favorable than it is to-day for a bounteous harvest, and never did our people look forward with more joyful anticipation for the future. The year 1892 will be an eventful one for the mining interest, and mine owners are confident of the good time coming, and that not very far distant.

NEVADA SULPHUR.—The Winnemucca *Silver State* says: Alex Wise has returned from a trip to his sulphur mines west of Humboldt House. A force of men was employed at the mines all winter taking out sulphur, and the refinery will be started up in a short time. The largest body of sulphur ever found has just been struck. This find, together with that mined during the winter, will furnish enough crude sulphur to keep the refinery running for some time. Mining and refining sulphur bids fair to become a prominent and profitable industry in this country at no distant day. Mr. Wise shipped a large quantity of refined sulphur from his mines last year, and intends to conduct the business on a larger scale than ever in the future.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

NEW YORK.—Amador Ledger, April 9: The large Huntington roller mill on this claim is idle, and has been for three weeks. W. G. Anderson informs us that they are waiting for the erection of pumping machinery to take the water out of the shaft below the tunnel level, where the best of the rock is met with. This shaft is 50 feet deep, with a drift run a considerable distance at the bottom. It is believed, with concentrators, that this ore would pay well. It yields fully one per cent of sulphur, and these so far have been allowed to go to waste.

AMADOR QUEEN.—I. N. DeWitt and George Thomas have been working the Amador Queen No. 2, on a lease from Dr. Bardne. They have struck a large bunch of heavy black metal, similar to that met with in the Mammoth mine at Middle Bar years ago. It is said there must be many tons of it. Whether it will pay or not remains to be seen. It is of the low-grade character, no free gold being visible. This ore cannot be worked by the ordinary milling process. It contains a heavy percentage of arsenic and other rebellious metals, and if it has to be shipped below for treatment, it must reach from \$40 to \$50 per ton to be worked to any profit.

CLINTON CONSOLIDATED.—D. Gutmann, of the Clinton Consolidated, brought down last Wednesday a box of specimens taken from the mine. There were 20 or 30 pieces of rock, all studded with free gold. They were taken partly from the 100-foot and partly from the 350 levels. Such ore would yield several hundred dollars per ton. In the upper level the rich rock is met with on the footwall; but at the 350, where the ore body is from 8 to 30 feet wide, sample quartz is distributed throughout the vein. Thirty stamps are now in steady motion, the ten additional stamps having been started this week. As the entire vein is sent to the mill, without sorting, the mine is a low-grade proposition, and its profitable working depends in a measure upon the quantity milled. An effort was made to sort the ore, but it was found impracticable, as chunks of apparently barren quartz when broken were found to contain a large percentage of precious metal. For this reason the idea of sorting was abandoned. The stamps are 1000 pounds each—the heaviest in the county—and crush an average of 100 tons per day, or 34 tons per stamp. It is in contemplation to add 30 stamps more, making 60 stamps. The vast deposit is sufficient to justify this increase. There are two distinct ledges—the Union, which carries most of the rich ore, and the Paugh ledge, which is plentifully charged with sulphurets. Altogether, the prospects of this mine are decidedly encouraging. An Ingersoll air compressor is being placed in position, and will soon be at work. There are 14 houses in Wieland—the town which has sprung into life in response to the mining activity. Eight more are to be built at once. A postoffice is assured in the near future, and the company intend to build a schoolhouse and employ a teacher at once, at their own expense if need be. All told, the company has expended fully \$300,000 on the property. It is inconceivable that such a vast outlay should be incurred unless the mill was surrendering gold in paying quantities. Mr. Gutmann says it is paying well now; that the ore averages something near \$6 per ton, most of it being caught in the batteries. At this rate, it takes second rank among the gold producers of the county, the Kennedy alone at the present time surpassing it. Charley Calvin, who has been employed by G. Gates for several months at the sulphurets saving plant below the Kennedy mill, has quit work there and is making arrangements to construct a plant for working the tailings at the Zeile. Mr. Detert, the superintendent, has given him the privilege on reasonable terms. It is said that from \$1 to \$1.50 per ton escapes in the tailings, and as the mill crushes on an average from 130 to 140 tons per day, this represents a loss of \$150 per day. If one-third of this can be saved, it will be a handsome thing for the promoter. The plant can be run with three men.

Butte.

BROWN HILL.—Oroville Mercury, April 7: There are four feet of snow, and the miners are happy as they are sure of a long season. The Wheeler & McMillan mine is taking out large quantities of pay gravel. It is now working four men, but when the season opens will put on three shifts. The Cascade mine commenced work last week. Paul Willett, owner of the Little Hope quartz mine, has tapped the ledge with a 300 foot tunnel and found rich quartz.

THE BLUE LEAD.—Hay & Clark, who are mining on the Blue lead, Potter claim, near Bangor, have very rich prospects. They have thoroughly tapped the gold-bearing lead, and found dirt that will average \$20 to the car. They are satisfied with this, and are now endeavoring to secure machinery adapted to that class of mining. The peculiar formation is hard, and must be pulverized before the dirt can be handled in a manner to extract the gold. Mr. Clark was in town yesterday, and appeared jubilant over his prospects. Other companies there have also splendid prospects.

MILL MACHINERY.—Oroville Mercury, April 7: Some time ago W. T. Coleman, the great quartz miner, bonded a ledge from Mr. Christy, near Jordan Hill. Last night, 53,000 pounds of quartz-mill machinery arrived at the depot for developing the property, and Mr. Paxton, who will superintend it, is in town to-day arranging to have the freight hauled to the mine.

Inyo.

SALINE.—Inyo Register, April 16: The prospects for the Saline Valley borax enterprises are highly flattering. Southern and partners have the necessary hoilers, tanks, etc., all ready for business. Operations will begin this week under the control and charge of H. W. Barton, a borax miner of Columbus experience. Probably 75 tons of crude material are alongside the boiler to start on, while the entire quantity available is so great that the operators do not expect it to become exhausted so long as they live and are able to work it.

Nevada.

WYOMING.—Grass Valley Tidings, April 8: The Wyoming company, operating in South Grass Valley, have a new incline down a depth of 70 feet. The old incline is under the ledge. Ore from the new shaft, where the ledge has been cut and is a foot in width, shows gold freely and carries a good percentage of gold-bearing sulphurets, also lead. The Jack Rabbit shaft is down 215 feet. A new 8-inch pump is to be put in within a week. At present it is ledge is somewhat broken, but the stringers he of comparatively high grade and the connate rock is alive with mineral.

PROMISING ORE AT THE HERMOSA.—In the south drift of the Hermosa mine, at a distance of 150 feet from the shaft, an 18-inch ledge of ore, showing good sulphurets and some free gold, has been cut. The formation is large. There is 10 inches of solid ore, the remainder broken up with stringers. The north and south drifts of the 500 level look more promising than ever before. There is a good formation on either side.

RICH QUARTZ FROM GOLD FLAT.—Grass Valley Union, April 14: Supt. Skewes brought to town yesterday from the Gold Flat mine a number of pieces of quartz of remarkable richness in gold, both leaf and solid gold embedded in crystals. The specimens, which came from the upraise above the 300 level, were rare and beautiful and attracted much attention.

GOLD FLAT MINE.—Grass Valley Telegraph, April 11: We held time Saturday evening for only a meager notice of the rich ore found in the Gold Flat mine. The rich specimens came from a large body of ore in the heck of the level and from the south part. The company is mostly composed of Grass Valley people, and besides the Gold Flat they have a bond on the Potosi mine adjoining, and will in a short time commence a drift from the 225 level of the Gold Flat to tap the large vein of the Potosi. It is supposed that the proposed drift will have to be run about 350 feet to do the business. The Gold Flat is the old Bruce Lee mine and the Potosi is owned by John Burns, who lives on Gold Flat. Years ago much valuable rock was taken from the Potosi, and all who are acquainted with the property rate it as being first-class. Paul Quick worked the Potosi a long time ago.

PEABODY MINE.—Grass Valley Union, April 12: Important improvements have been and are now being made at the hoisting and pumping works of the Peabody mine. The buildings have been enlarged until they are now of efficient dimensions for carrying on extensive operations. The main working shaft is now down 430 feet, and in the course of a week or ten days the new 12-inch pump, which has been manufactured at Taylor's foundry, will be taken to the mine and put in place. It is an excellent piece of workmanship, and capable of doing valuable service. When it is set going, the pumping in the old works will be discontinued, as it will be capable of handling easily all the water the mine is making. With this pump it is expected that the shaft can be sunk 1000 feet. The work of sinking the shaft is kept up all the time, while the east and west drifts on the 400 level are being extended. The recent strike of wonderfully rich quartz was in drifting on this level, and when stoping is commenced it is confidently expected that more of the same quality will be found. On Saturday more of the same kind of quartz was taken out, the pieces of quartz being studded thickly with coarse gold, and when broken showed all through. When the pump is in place so that underground work can be prosecuted without interruption, a much larger amount of ore can be extracted. At the present time only five stamps of the mill are kept going, but they will pound out \$10,000 for the present month's run from the showing already made by the clean-ups. There is every possibility of the Peabody making one of the great mines of the district, and that it will be a fortune to its owners. This will be accomplished through the indomitable energy of Alf Tregidgo, the general manager, who has had the fullest faith in the mine from his first connection with it.

THE OLD STEEP HOLLOW DISTRICT.—Nevada Transcript, April 7: There will be considerable prospecting on the north fork of Steep Hollow this year, and systematic efforts will be made to strike the famous blue lead. The Democrat Hill placer mine, owned by Michael Skaehan and Richard Neville, is undoubtedly a good mining claim. It contains 1653 acres of land, and is situated in Remington Hill mining district, adjoining the once famous Remington Hill mine, from which James Green, in 1864, took nuggets valued at \$7000, \$3000 and \$2000, respectively. A tunnel low enough, and about 250 feet in length, would now place the mine upon a paying basis. The channel is about 3000 feet wide. The surface ground is well timbered, and the mine owners have a good water right. A great deal of gold has been taken from this mine. J. M. Blain has a high channel containing large, smoothly washed boulders of quartz, mixed with the gravel. His tunnel will strike good gravel soon. A. B. Everetts of Guernsey county, Ohio, is negotiating for the purchase of the claim adjoining the Pioneer. The owners of this mine are Messrs. Greely, Vance, Beightol and Mackin.

PROMISING STRIKE.—M. D. Cooley has made

a valuable strike in his mine near Washington. A ledge of fine-looking quartz, running from four to five feet in thickness, has been struck, the ore showing free gold and carrying a large percentage of rich sulphurets and galena. Mr. Cooley feels highly elated over his prospects, and talks of erecting a mill to be run by electricity. Development work will be pushed as rapidly as possible.

Plumas.

GENESEE.—Cor. Plumas National, April 9: Mr. Gruss is working a large crew of men, and by the continuous patter of the stamps and his pleasant smile, one is led to believe, with favorable results. This mine is located in two hills, called the North and the South, and the most of the work done by Mr. Gruss has been in the latter. It was here he sunk a shaft last winter, and at present, with the other work being done, he is running a tunnel from the lower level of the South Hill to cut a vein known to be in the North Hill. I am informed that he has between two and three hundred feet more to run. In this tunnel he lately cut a vein of beautiful peacock copper ore, rich in gold, but unfortunately it is so low that much of it can be worked without sinking the shaft to a greater depth. Mr. Ant na Joseph has been taking life easy this past winter, and is waiting for the water to get low enough for him to resume work and pick up the big bright nuggets as in former seasons. Charles Moren is also and for many years has been running a tunnel in Grizzly to tap the gravel deposit. I hear that Mr. Brandt is negotiating for the sale of his mine. Mr. Brandt has certainly one of the very best ten-stamp mills in the county, and, I am told, has some rich rock. Mr. Graham of the Green ledge, who has been in ill-health for the past winter, is still quite poorly. Mr. Sipes, his partner, is driving ahead. They took out some very rich ore last fall. Mr. Tutt, better known as Barney, is driving his tunnel to cut a back ledge that crops out on the surface. Next, but not least, is Mr. Thurner's claim. In the late fall and the early winter Mr. Thurner ran about 180 tons of ore through Mr. Tutt's arrastre. John Bordan, who is chief engineer of the hoisting works at the Gruss mine, and son, are running a tunnel to cut the main contact, on the surface of which they get some very flattering prospects. Mr. J. S. McDonald, who has lately had Mr. Williams employed, is steadily pushing his tunnel ahead. Out of a shaft a little ahead of face of drift, an Indian, from whom Mc thought, took out some very rich rock.

Placer.

PAYINO.—Placer Republican, April 6: In reference to Placer county mines, we learn that the Morning Star mine in its last dividend paid \$4 per share. The Holman drift mine at Wisconsin Hill is paying well. Gravel in the Breece & Wheeler mine has been going as high as \$4.02 to the car.

San Bernardino.

GOLD AND SILVER.—Redlands Citigraph, April 9: A considerable interest has been occasioned the past week by the discovery of a ledge of gold and silver-bearing ore on the foothills east of Montone. There is a well defined ledge of white quartz in a slate formation. The results attained by 30 or 40 assays are somewhat peculiar. One assay will yield nothing, while others will give as high as \$35 to \$43 per ton, the ore coming from the same portion of the ledge and having the same appearance. The location is about five miles from the center of Redlands and about one mile from Montone.

TIN.—One of the most important discoveries of the season is that of rich tin mines in the eastern part of this county. The mines are 35 miles south of the Old Woman's mountains. The veins are large and carry a high per cent of tin. Some valuable silver mines have also been located in that portion of the country.

NEW TIN MINES.—San Bernardino Times-Index, April 9: Mr. Judson, who has just come in from a trip to the Colorado river country, was met by our reporter this morning, and the following interview speaks well for that part of the county lying northeast of the San Bernardino range of mountains: "Well, Mr. Judson, we learn that you have just returned from the recent rich mineral finds out on the desert. Will you give us some information of what there is in that country?" "Yes, sir, I will. In the first place let me say that these new finds are not on the desert. They are all located in well-defined mountain ranges, which are at present reached by crossing a desert country of 40 miles from Danby station in an easterly direction. I think the best way for prospectors to go in would be by way of the Needles; then go down the river, as the Needle, with its great advantages over all other places on the line of the A. P. R. R., will be the outfitting point for all of the Colorado river country. The recent discoveries of silver mines by some prospectors from Ehrenburg, Arizona, and what I believe will develop into one of the best silver camps in the State, is situated less than 18 miles from the Colorado river, and about 40 miles in a southwesterly direction from the Needles. These gentlemen made eight or ten locations in the new camp. The ore is very rich and resembles the rich silver ore that was taken out of the mines in the Ivanpah camp in its most palmy days. The tin ore discoveries were made about 35 miles nearly south from the Old Woman's mountains. The veins are very large, being from 20 to 60 feet wide, the entire length of five locations. The entire ore body in all the claims carries a very high per cent of tin. While I have a substantial interest in the tin locations, neither myself nor Mr. Edwards made the discoveries. The discovery was made by a well-known prospector one week before we went into the country. The statement as published that we located this property was not correct. We went out to examine what is known as the Scanlin group of mines situated 25 miles southeast of Danby station, which is

silver and gold, and sure to be one of the many new bullion-producing camps in that country in the near future." "Mr. Judson, can you give us any information regarding the rich strike which was recently made in the Iber mine near the Needles?" "Yes, sir. There has been no strike made lately in the Iber mine. The strike has been from the surface down in the shaft and not a pick has been struck from the top to the bottom of the shaft but what brought up ore that will mill from \$300 to \$600 to the ton. The now famous Iber gold mine discovery was made, I think, about five years ago by a well-known prospector, Wm. McCoy. Where the discovery was made the croppings showed a large amount of free gold, and also in many different places along the line of the vein. A shaft was sunk by these former owners to a depth of 60 feet. This work was all done quite a distance from the ore body or vein in soft ground, but when the hard-shelled Baptist people of Riverside got hold of the mine, who are as eager for gold as they are for county division, they started in on the gold rock from surface and have made a most wonderful winning. This property has been regarded generally of but little value. Last summer I was induced by Mr. McCoy to go out and examine the mine. I was so favorably impressed with my first visit to the property that I made two other trips to the mine alone."

Shasta.

GLADSTONE.—Redding Free Press, April 9: Capt. Clark of the Gladstone mine was in this city Wednesday, accompanied by two members of the company who had just been on a visit to the mill and mine on Klein gulch. Capt. Clark informed us that his partners were more than pleased at the outlook for the mine. Last month, with 20 stamps, 1700 tons of ore were put through the mill. Two fine bodies of ore have been recently discovered. Mr. Clerk states that ore averaging \$12 to the ton is good enough, as he is able to save all but a small per cent of the gold. The Gladstone employs about 100 men and is probably the best equipped mine in Shasta county.

NOTES.—The Little Nellie mine has just received new screens, plates, bolts, etc., in fact, two and a half tons of new lining for their Dodge pulverizer. J. M. Gleaves, the superintendent, expects to make a good clean-up in several days. F. G. Gould of the Phoenix Iron Works, San Francisco, has been visiting our mines and introducing the Denver concentrators. Supt. Barron of the Snyder mine, on Squaw creek, has ordered one.

NEVADA.

Washoe District.

CONC. CALIFORNIA AND VIRGINIA.—Virginia Chronicle, April 9: 1500 level—The drift running south from the shaft station has been extended 35 feet; total length, 190 feet. At this point we are extracting some ore and fillings in the vicinity of the old stopes. 1650 level—Have continued to extract ore of fair quality from the drift run west from the top of the upraise carried up 69 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. From the north and of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality. 1750 level—In working out and upward from the bottom of winze No. 2, sunk from the 1650 level, we continue to extract ore of fair quality, also some milling ore from the stopes on the eighth floor. In the east crosscut No. 3 from the main south drift some ore has been extracted. From the drift run north from the same east crosscut, at a point 20 feet north from that crosscut, the winze has been sunk five feet; total depth, 22 feet. From this point an east crosscut has been advanced 20 feet in quartz formation, showing some ore of milling value. There has been extracted from all parts of the mine during the week 1187 470-2000 tons of ore, which was shipped to the Enreka mill. The average assay value of the ore worked at the Enreka mill during the week, 870 tons, was \$17.50. Bullion shipped to the Carson Mint, assay value about \$24,389.65.

OPHIR.—1465 level—From the end of the crosscut run east from the drift run north from the drift run west from the winze 122 feet below the sill floor of the 1300 level, a east crosscut No. 2, has been extended 25 feet; total length, 63 feet; continuing in porphyry and quartz of low assay value. From the mouth of the north drift have commenced working easterly and extracted some milling ore therefrom. Have been making some repairs to the 1550 station.

MEXICAN.—On the 1465 level the south drift from the crosscut running east from the bottom of the winze 32 feet east from the winze, has been advanced 20 feet; total, 54 feet, continuing in porphyry with quartz of low assay value.

UNION CON.—The Union Con. east crosscut, started from the south lateral drift at a point 1570 feet west from the shaft, has been advanced 20 feet. The face is in clay and porphyry.

HALE & NORCROSS.—On the 900 level the north winze was sunk during the week 15 feet; total depth, 25 feet; bottom is in quartz, but of no value. East crosscut above 900 level on the north line was advanced 30 feet; total length, 45 feet. Formation, quartz and porphyry. 1100 level—Extracting ore from above and below this level. 1500 level—Have stopped work in bottom of No. 1 winze below this level and started to stop out ore south from the bottom of the winze. Have men on repairs and doing prospecting work. Yesterday we began shipping ore to the Occidental mill, where 100 tons will be tested. During the week have hoisted 535 mining cars of ore from the 1100 and 1500 levels, and shipped to the Brunswick mill 441 420-2000 tons. Average battery assay of ore worked at the Brunswick mill for the week,

\$17.05. Shipped to U. S. Mint, Carson, during the week bullion of the assay value of \$4,418.55.

OCCIDENTAL.—The winze from west crosscut in the south drift, 350 level, has been connected with the crosscut in the south drift on the 400 level. North drift, 450 level, is in 45 feet, and continues in fair ore. West crosscut from north drift, 550 level, is in 22 feet; face shows seams of pay ore. Have started a crosscut on the 750 level at a point 350 feet north of winze station; face in low grade quartz.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, was extended during the week 25 feet, making its total distance west of shaft 1825 feet; face in porphyry. The north drift from the Kenosha tunnel was advanced 40 feet; total distance, 863 feet; face in porphyry.

UTAH.—The west drift from the shaft station, 340 level, has been extended 54 feet; total length, 451 feet. This drift has been passing through a very hard porphyry formation, but the face it presents is softer and more favorable looking.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 645 feet; face in gypsum.

CON. NEW YORK.—The west drift from top of raise, 75 feet above 600 level, is out 14 feet in quartz, showing bunches of good ore.

CHOLLAR.—Are making repairs on the 450, 650 and 750 levels. The east crosscut on 1610 level, 150 feet south of north line, is out 40 feet; face in hard porphyry.

BULLION.—The east crosscut, 350 feet south of north line, 1300 level, is out 27 feet; face in quartz and porphyry that give low assays. The joint Potosi and Bullion west crosscut, 1500 level, is out 103 feet; face in hard porphyry. The east crosscut, 120 feet south of north line, 1500 level, is out 286 feet; face in hard porphyry.

BEST & BELCHER.—900 level.—All work in east crosscut No. 1 for the past week has been on repairs. West crosscut No. 1 has been advanced 15 feet through hard porphyry and stringers of quartz; total length, 155 feet.

POTOSI.—Are repairing north drift from Sharon shaft on the 250 level. The south raise above the 1100 level is up 105 feet on the slope; top in porphyry and streaks of quartz. The winze is now down 182 feet below the 1500 level; bottom in low grade quartz. The joint Potosi and Bullion west crosscut, 1500 level, is out 103 feet; face in hard porphyry. Extracted and sent to mill during the week 350 tons of ore; milled during the week, 200 tons; on hand at mill, 151 tons; average battery assay, \$24.38.

Highland District.

PROSPECTS.—Pioche Record, April 7: Several very encouraging prospects are being opened on the west side of the range just beyond the Mendah mine. Pete Honeyman and Jack Baxter came in from that place a few days ago considerably excited over the discovery of a rich vein of chloride in the Carbonate claim, which was taken up only last January. As soon as the snow will permit, work will be resumed and the boys are assured of all the assistance required to properly open up the claim. The prevailing opinion of that section is that good-paying mines will be opened up there, though it is somewhat difficult of access.

Tuscarora District.

DEL MONTE.—Times-Review, April 9: Will start No. 1 north drift as soon as it can be re-timbered, the country being soft and swelling ground.

NEVADA QUEEN.—Second level.—No. 1 south drift has been extended 31 feet, and No. 3 east crosscut 26 feet, cutting through a seam of high-grade ore. This is in the footwall, the vein being above. Have started drift from top of No. 2 and 3 raises, so that stopes can be started as soon as the connection is made between east crosscut and No. 1 south drift. The ore in the top of both raises assays from \$248 to \$1074 per ton. Third level.—No. 3 raise, 120 feet east of No. 1, at 10 feet cut, 12 inches of good ore; chute has been placed and started to open up on the ore. Stopes at No. 1 and 2 chutes continue about the same; produced 8 tons first-class, average assay \$316 per ton, and 123 cars of second-class, average assay \$36 per ton. Sent to sampling works 19.76 tons of ore, average assay, \$296.21 per ton.

NAVAJO.—No. 2 winze, 300-foot level, extended 7 feet. The vein is not looking as well as at last report. No change elsewhere.

BELLE ISLE.—West crosscut No. 2, 350-foot level, has been extended 20 feet. North drift from No. 1 east extended nine feet, with fair assays.

NORTH BELLE ISLE.—West crosscut, 400-foot level, extended 9 feet. South intermediate drift above the 500-foot level extended 12 feet, showing good ore. Crosscut from the intermediate 15 feet. No. 4 north drift, south 500, extended 8 feet; west crosscut, same level, extended nine feet.

Pine Nut District.

ACTIVE.—Silver State, April 9: There is considerable activity in Pine Nut district, near Carson. Some of the mine owners are building, while others are putting in their time jumping claims. The case involving an interest in the Zirn mine, the most important location in the district is now being tried in the District Court at G. noa.

NEW MEXICO.

MIMBRES.—Southwest Sentinel, April 9: Thos. B. Pheby of the Mimbres Consolidated M. and M. Co. has received orders to stop work in the mines of the company. The mill will run long enough to clean up the ore now out, but nothing further will be done until the price of silver gets up around the dollar mark. There

is nothing in mining silver even in the rich mines of this company at present prices. The contract for hauling the machinery and timbers of the Telegraph mill, which was purchased some time since by John Brockman of this city, has been let to Fred Harrison. The mill is to be hauled to Bremen's ranch, near Lone Mountain, and the work is to be completed by the 15th of May. Additional machinery for the mill has been ordered from the East, and the mill will be put up and got ready for operation as soon as possible. Work has been commenced on the new mill near the Maud S. mine, in the Silver Creek district, and it will be pushed to completion as rapidly as men and money can do the work. It is the intention of the owners of the property to have the mill running some time in July. It will have a capacity of about 35 tons of ore daily. During the first three months of this year the ore was more rich in mining strikes made in this county, and more sales commenced in this part of the Territory, than in any similar period in the history of the county. This is going to be a good year for millwrights in this section. Work has been commenced on the new mill at the Confidence Co. as soon as the title to the property can be perfected; the St. Helena C. will build a mill at Central this summer, and John Brockman will put up the Telegraph mill at Lone Mountain. Other mills are being talked about, and probably some will be built before the close of the year. The Colchis mill here, which has been under way for so long a time, is now in a fair way for completion. These mills will, when completed, add more than 500 tons to the daily milling capacity of this section. Nathaniel Bell of the firm of Bell & Stephens, of Pinos Altos, paid this office a visit last Saturday and exhibit d two gold bricks which had been turned out at the Bell & Stephens mill. One weighed 91 ounces and was valued at \$17.50 per ounce. The brick, besides seven tons of concentrates which will run \$65 per ton, was the result of a recent run of ore from the Golden Rule (now the Santa Rosalia mine). The other brick was out of a run of 64 tons of ore from the Pacific Extension mine at Pinos Altos, and was worth about \$15 per ounce. The concentrates from this ore will run about \$85 per ton. The ore from which this brick was made came from 100 feet deeper in the mine than any ore from the mine ever worked before. As soon as the title to the Confidence group, in the Silver Creek district, can be perfected, the company will build a large mill. It has not yet been fully decided whether the mill will be built at the mine and the power transmitted by electricity from the creek, where a large water wheel will be put in, or whether the mill will be built on the creek and the ore be transported by rail to the mill. Both projects are under consideration, and an electric plant would undoubtedly be put in if there had been a water supply at the mine sufficient for use in the mill.

OREGON.

A RICH STRIKE.—Eugene Register, April 9: A gentleman who came in from the Myrtle Creek mines this week reports a rich strike there. They have struck an old channel that is extremely rich in the yellow metal. He says he saw \$30 taken out of three pans, and one pan yielded \$10, one piece being valued at \$9. This is looked upon by the men as the richest strike in that region, but there is acre after acre of good paying dirt. Washing is going on right along, and it is likely that the next cleanup will be a good one.

UTAH.

DEEP CREEK.—Salt Lake Journal, April 7: A very rich discovery of silver ore is reported on the east flank of the Deep Creek mountains, about 12 miles from Kearney's ranch. The first-class ore assays from 7360 to 20,000 ounces in silver, and a sample lot of 100 pounds taken from almost barren-looking croppings from 10 to 20 feet above the surface of the ground and across the ledge 80 feet in width was assayed, giving 2120.69 ounces to the ton. This rich mineral deposit promises to be the only rival, so far discovered, of the famous Treasure Hill, White Pine county, Nevada. The formation in which this discovery was made is hard, blue lime, identical with that of the Treasure Hill. The mineral is strictly a silver ore, and carries neither gold, lead nor any other metal, with the exception of a little copper. The big ore discovery is less than two weeks ago, together with the further discovery in Fish Springs within the past month, seem to fully justify the prediction that this will be a great year for the mining industry of Utah.

WASHINGTON.

A STRIKE.—Centerville Leader, April 7: M. G. Barney and M. A. Rush have made a strike which promises to eclipse anything that Okanogan county has ever produced. Last Thursday, in company with an expert, they were looking over a claim which they own on Mt. Chepaca, with the view of putting some men at work to open it up. The gentleman who was with them detected that at short distance from the ledge they had been working on (which is the second extension of the famous Hunter ledge) and running parallel with it, was an immense ledge of quartz fully 100 feet wide. They broke a few pieces at random from the ledge, and, after locating three claims adjoining this one, came down to Loomis and had a piece of the ore assayed. It went \$16.53 in gold and 30 cents in silver. This was much better than they expected, and to satisfy themselves of its real value they will at once make a thorough test of the ledge. It is estimated that if the ore is free-milling and will average \$4 per ton, it is the richest thing yet discovered in the county.

Mining Companies' Financial Standing.

The following is the financial standing on the first Monday of the present month of the mining companies listed on the two exchanges in this city:

Dr.	Cr.
ARIZONA MINES.	Hale & Norcross, \$4,630
Crocker	Justice, \$7,717
Peck	Kentuck, \$3,326
Peck	Lacy Washington, \$450
Silver King	313 Mex. can., \$7,621
Weldon	83 Oec dental, 303
BODIE MINES.	Ophir, 13,078
Bodie	Overman, 3,122
Bulwer	27,962 Potol., 10,713
Mingo	2,709 Savage, 25,515
Standard	38,114 Seg. Bul. hor., 2,086
Summit	636
Syncline	1,337 Sierra Nevada, 19,048
COMSTOCK MINES.	Ward Hill, 1,733
Alpha	6,918 Union, 13,999
Alta	35,214 Utah, 1,031
Andes	—
Belditch	31,502
Benton	606.9 Copins, 1,186
Best & Belcher	2,061 Commonwealth, 26,378
Bullion	18,623
Caladonia	8,411 Grand Pico, 6,488
Challenge	122
Chollar	6,489
Confidence	13,452
Con. Cal. & Va.	15,239 North Belle Isle, 27,217
Con. Imperial	1,132 N. Commonwealth, 3,439
Con. New York	277
Crowa Point	3,339
Exchequer	17,278 Enreka, 2
East Sierra Nev.	43 Holmes, 42,084
Gould & Curry	10,815 Mt. Diablo, 3,478

*Collecting assessment.

NOTE.—Ophir has unsold bullion valued at \$7500. Navajo has \$1,300 due on pumping account. Overman has \$800 due on assessments. Con. Cal. & Virginia has \$16,651.31 in bullion, with other shipments to arrive. Hale & Norcross has unsold bullion valued at \$12,255.86.

Mining Share Market.

SAN FRANCISCO, April 14, 1892.

Mining shares the past week sold down under systematic cross-orders by the stock pools and mill rings. The writer still believes in an up-move and now that quotations have been made so low it ought not to surprise anyone to witness higher prices than have been expected by those who claim to be able to get the very best of information. While a firm believer in high prices yet the writer cautions dealers to be prepared for set-backs and also big breaks, for no market can be successfully made without them. The mill rings have crushed the life out of the market through a system of procrastination, expensive dead work—much of which is unnecessary—and many leaks, to eat up money, by which excuses could be had to levy assessments. For five long years this has been done and with the best results as far as insiders are concerned. With the shares of several mines known to have good ore opened on several levels, selling at prices about as low as they usually get, it does seem as if persons who hold shares will stand a good show of making considerable money, more than by any other means before the end of the year. Now, after hard work in freezing out outside shareholders, the managers of these mines have the water under control so that more active work can be done in pumping the mines out, and as good air connection has been made on the 1700 foot level prospecting work can and doubtless will be done in several of the mines, which ought to be followed with the best of results.

Between now and the month of August several mining companies will hold their annual elections. The first will be that of Con. Imperial, which will be followed by that of Crown Point, then by that of Overman and two or three others.

The Standard Con. Mining Company and the Bulwer Mining Company, both in the Bodie district, have declared a 10 cent dividend. These two companies have reversed the usual order of things, for they declare dividends with the shares selling quite low; heretofore dividends were only declared when the shares were selling at high prices. The trading public does not know what to think of the new move.

Mining shares opened this morning fairly steady under a light business. To show how trading has fallen off and how little interest is manifested in the business, we will state that at about 11 o'clock this morning there were only 12 persons present in the S. F. Stock & Exchange board room. The "tickers" in the various places of resort are also more or less deserted.

On Tuesday, April 12th, the directors of the Hale & Norcross Mining Company held a meeting, at which the president of the company was instructed to request the superintendent of the mine to conform to the laws under which the company incorporated. In the letter to the superintendent, the president, Mr. Messer, gave sections of what is known as the Felton amendment (this is given in another department of to-day's paper) approved April 23, 1890. Mr. Messer also gave at some length the Supreme Court's decision in the case of Manuel Eyre vs. A. K. P. Harmon, et al., reversing the decision of a lower court on the above section of the law. The Supreme Court ruled that the Felton amendment was not conforming to in every particular. The letter closes as follows: "It is the intention of the board of directors of this corporation (Hale & Norcross Mining Company) to comply with all the provisions of the law of this State in regard to mining corporations and the object of the board in writing this letter is to give you, as its superintendent, notice of the above decision, as a guide by which your administration of the company's affairs shall be conducted, and request and direct that all the requirements of the law be complied with. We desire to manage and direct the affairs of this corporation with a proper regard for the rights of those for whom we are responsible, and object of the statute is to secure to stockholders their right, to have general information of the manner in which the business of the company is being conducted, and to give them that information in the manner indicated by the statute." The above, which is good reading for assessed-rack shareholders, will do no little good in allaying all opposition and causing the organizations as the Mining Stock Association and Brokers' Combine to stand in with those mine managers, who seek an honest reformation in mining and the milling of ore. The revelation in the suit against the directors of the Hale & Norcross Mining Company opened the eyes of mine managers, who live elsewhere than at Virginia City, to the manner in which they are being victimized, and to this, no doubt, is largely due their earnest desire of fighting the manv wrongs.

News from the Comstock district is generally of a very encouraging character. Important work is outlined in one of two groups of mines, which will have a favorable bearing on the mining share market, provided the mine managers follow the example of the directors of Hale & Norcross. On the 1800-foot Ward shaft level, the work to be done will be largely directed toward developing at that depth of Potosi, Sullion, Alpha and Exchequer mines. Air connections have been made on the 1700-foot level between Crown Point and Belcher. This is quite important. The official letter received this week from the superintendent of the latter mine reports that in the north drift on the 1300-foot level running toward Crown Point the face in quartz is assaying from \$1 to \$11 a ton. This is liable to improve as the drift is worked ahead. On the 300-foot level in the same mine they are raising and also sinking on a rich streak of ore. Potosi is milling ore. The

low-grade ore left left by the former management is being milled by the new management of Hale & Norcross. When this is cleaned up the ore mills will assay higher. In Con. Virginia, on the 1800-foot level, they have rich ore from 12 to 16 feet wide. Official letters from Overman continue to give favorable news. Interesting news is looked for from the Alta group of mines.

Continued favorable news comes to hand from the Bodie district. The old Bodie mill is to have some kind of improvement made by which its crushing capacity will be increased. Active prospecting work is under way in the Quijotoa and Tuscarora districts.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING APRIL 5, 1892.

472,492.—NEWSPAPER VENDING MACHINE—Alexander Berg, Seattle, Wash.

472,101.—CIGARETTE MACHINE—H. Bohls, S. F.

472,031.—SAW-FILING MACHINE—E. Christensen, Portland, Or.

472,432.—FRICTION COUPLING—H. P. Christie, S. F.

472,112.—HILLSIDE PLOW—D. B. English, Guerneville, Cal.

472,170.—MUSIC-LEAF TURNER—E. G. Gillespie, Artesia, Cal.

472,497.—STAMP-CANCELING MACHINE—W. Groth, Seattle, Wash.

472,351.—BABY JUMPER—J. Higham, Oakland, Cal.

472,169.—TOLL-COLLECTING APPARATUS FOR TELEPHONES—Kato & Rhodes, Los Angeles, Cal.

472,300.—EXHIBITION CAR—M. Leak, S. F.

472,374.—MAGAZINE TACK HAMMER—A. T. Lewis, East Portland, Or.

472,378.—GOVERNOR FOR STEAM ENGINES—R. G. Manifold, S. F.

472,304.—PRUNING IMPLEMENT—C. L. Mann, Colma, Cal.

472,507.—COIN-ACTUATED VENDING MACHINE—Robert Morau, Seattle, Wash.

472,278.—LABEL HOLDER—H. J. Small, Sacramento, Cal.

472,489.—NUT LOCK—W. P. Sweetland, S. F.

472,150.—JOURNAL BEARING—Todd & Anderson, Shelton, Wash.

472,151.—CENTER PLATE FOR LOGGING CARS—Todd & Anderson, Shelton, Wash.

472,152.—CHOCK BLOCK FOR LOGGING CARS—Todd & Anderson, Shelton, Wash.

21,449.—DESIGN FOR BUTTON—A. A. Brunswick, S. F.

The following brief list by telegraph, for April 5 will appear more complete on receipt of mail advices:

California—Arthur F. L. Bell, San Francisco, valve; J. N. and L. N. Burke, Forest Hill, elastic trace connection; George S. Burnett and S. T. Sweeney, San Francisco, curvycomb; Quintus V. P. Day, Dinuba, harness hook; Lorenzo Dwight and A. A. Jephuni, San Francisco, waste-water gate for washing machine; William H. Kidd, Santa Rosa, sawhandle; John M. Lockwood, San Francisco, electric lighting system; Elbridge G. Miles, San Francisco, shoe ward North, Newhall, check-book; Anna C. Peck, San Francisco, carving brace; Alfred C. Rulofsen, San Francisco, curvycomb; Augusta Tache, San Francisco, chalk-line holder; G. H. White, San Francisco, administrator of George W. White, deceased; John M. Lockwood, San Francisco, street sewers; George Winkler, San Francisco, animal trap; Fred W. Wood, J. F. Fowler, Los Angeles, brake for street cars; Washington—Eric Silen, Kelso, combined churn and butter-maker; John T. Lake, Seattle, device for producing blasts of air for ventilation.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co. in the shortest time possible (by mail for telegraphic orders). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press U. S. and Foreign Patent Agency, the following are worthy of special mention:

STUMP PULLER.—Wm. B. Morris, Seattle, Wash. No. 471,873. Dated March 29, 1892. This is an improvement on a similar device patented by the same inventor, August 4, 1891, and consists of a novel arrangement of gripping clamps operated by oppositely moving eccentrics upon a power shaft which causes them to reciprocate alternately. These clamps act upon a draw bar, moving in suitable guides and having the pulling rope attached to one end. This rope acts through any suitable blocks upon the stump to be pulled. The opposite end of the machine is anchored firmly to hold it stationary and all the power to be applied to pull the stump.

CONNECTING RO JOINT AND BEARING.—Milton A. Clennam, S. F., assignor of one-half to Weldon C. Rarig, No. 471,953. Dated March 29, 1892. This invention consists of two sleeves interposed between the pin or shaft and the inclosing box in which the pin or shaft turns. These sleeves are made of phosphor bronze or other suitable material for wearing surfaces, the inner one being keyed to the shaft or pin and the outer one to the interior of the box, so that the wearing friction takes place between the two sleeves. These sleeves are easily replaced when worn, and the other parts are never subjected to wear.

EXHIBITION CAR.—Mondula Leak, S. F., assignor to the Leak Advertising Co. No. 472,300. Dated April 5, 1892. This invention is designed to provide a car which is to travel about the country from place to place upon the railway, said car being provided with devices for the exhibition of goods and a convenient arrangement of eating, sleeping and office fixtures which are convertible to one form or another for night or day use as may be desired. The car, as constructed, is especially available for exhibition, office and residence purposes.

MECHANICAL PROGRESS.

Smoke Prevention at Chicago.

Last week circular letters were sent to the president and superintendent of motive power of every railroad entering Chicago, says the *Coal Trade Journal*, stating that tests of smoke consumption had been made and three devices found that can be applied to locomotives and which will suppress the nuisance satisfactorily. The various roads will be allowed sixty days in which to equip their engines with any of the three or any other device which will accomplish the same result. After the expiration of that time offenders will be prosecuted without further warning. In view of the opposition expected from railroad officials, the society's engineer, Mr. White, was careful to have his tests thorough in every respect. It would appear that some owners of these devices have met with scant courtesy at the hands of railroad officials. The experiments on the tug boats are to be made this week. All of this is a matter which concerns the coal trade very closely, and operators and shippers are watching the results and outcome very sharply. A device brought out very recently is designed for use in private residences, where the smoke in each individual case is not great, but in the aggregate it is large, and as this is the age for improvement, owners of dwelling houses should know that they, too, can aid in abating the smoke nuisance. The device we refer to employs the down draft system of combustion and is built for air-heating. The owners of this patent claim that combustion in the furnace is complete in all respects; that consequently it emits no foul smell; that it is a great fuel saver and gives out greater heat than the ordinary furnace, because it gets all the units of heat out of the fuel that there are in it. Consulting Engineer White of the Society for the Prevention of Smoke, in a recent lecture at a meeting of stationary engineers, said: "There are comparatively few inefficient boiler structures, but the number of inefficient furnace structures is many. The cause of excessive smoke was undoubtedly due to overcrowding the combustion chamber, *i. e.*, overtasking its capacity and the furnaces could not burn the fuel supplied to them. Nothing unreasonable will be asked from offenders; they will not be prosecuted for the use of soft coal, nor for the production of smoke, which is conceded to be unavoidable at certain times and under certain conditions. But that persistent offenders will be 'brought to time' is a foregone conclusion." It will cost time and effort to accomplish the desired result, but it must and will be done.

New Form of Coal-Washing Machinery.

A French trade publication gives an account of a new form of coal washer. This is a modification of the piston-jigger, having an arrangement for scraping the surface and removing the top of the washer layer under treatment. It consists of a sieve-plate 10 feet long and 3½ feet in width, the apertures being largest next the feed end—fixed on a pyramidal hutch, having a plunger box attached to one of the long slides, and an opening variable by adjustable slides for the discharge of the heavier waste on the other. The piston is a circular wooden dish moved by an eccentric and communicating motion of the water in the hutch through a cushion of air confined above the water in the piston box. The scraper is a harrow-like frame suspended by a system of jointed rods above the sieve-plate, and receives motion from a cam acting upon the counterpoised arm of an angle lever, which gives a slow forward and quick return motion. The frame is connected with a slide, opening the feed-hopper, so as to allow a fresh portion of material to be dropped upon the plate at the coarse end, at the commencement of each stroke, where it is subjected to the most energetic action of the water, while the finer portions of previous charges brought to the surface are drawn forward by the teeth projecting from the frame toward the discharging end. Usually the frame is so suspended as to pass clear of the charge on the return stroke. The length of the stroke of the frame is 20 inches, so that the surface of the washed material is broken up six times in its passage over the ten feet length of plate.

The machines weigh about six tons each, and are worked in pairs, each pair requiring a motive power of four to six h. p., and one man to attend to them, and the average product is 15 tons per hour for the two machines.

NEW ENGLISH ENGINE REGULATIONS.—Some valuable practical regulations have recently been published by the English

builders of a high-speed engine said to run satisfactorily at 700 revolutions per minute and to develop 200 horse-power. According to this, if the boiler pressure always exceeds 70 pounds, it is worth while to use a compound engine, and, if as high as 150 pounds, a triple-expansion engine. If the engine exhausts into a vacuum the corresponding pressure will be about one-fourth lower—the extent to which the steam may be expanded with advantage depending on the boiler pressure; if the expansion is carried to more than a certain number of volumes it is advantageous to divide it into two stages—that is to expand partly in a high pressure or small cylinder or cylinders and partly in a low pressure or large cylinder; with still greater expansion, it is worth while to expand in three stages, that is, in three successive cylinders of increasing diameter, and so on. It is admitted, however, that, although there are great practical and economic advantages in the system of expansion in successive stages, there is no essential difference in principle between expanding, say, eight times, in a series of three cylinders, with comparatively late cut off in the first or smallest one, and expanding eight times in the largest of the three only, with the steam admitted to it direct and cut off at one-eighth stroke.—Scientific Machinist.

Uses of Wood Pulp.

Wood pulp is now extensively used as a composition for moldings and decorative work in private and public buildings. In the manipulation of this composition, beautiful effects can be obtained by mixing in it the various aniline colors—strong or tinted—or those known as metallic colors. Bronze powders, of various colors, may also be used with pleasing results. By the use of this material all the better qualities of fine-grained wood are obtained without any of the drawbacks of shrinking or expanding on account of atmospheric conditions.

The extent to which the wood pulp business has been developed in this country is not generally known. The inroads on our forests, which its growing consumption for railway ties, building and the requirements of the press involve, are numerous. So serious has this matter become, it is stated, that unless each State passes a law for the encouragement of tree planting, there will some day be a tree famine.

As giving an inkling of the magnitude of the general consumption of wood pulp, a correspondent states that for a single edition of a prominent daily in New York 17 tons of blank paper were required. This was the product of 67 cords of poplar. In 22 hours from the time of felling the trees it had been turned into printed papers. The process is thus divided with respect to a test case: Chopping one half cords of wood, three hours; manufacturing into pulp, 12 hours; transporting to printing office, one hour and twenty minutes; wetting paper preparatory to printing, 30 minutes; printing 10,000 copies, ten minutes. This shows the rapidity with which raw material can be turned into a finished article. When it is considered that the foregoing figures refer to only one paper in one city, and that almost every newspaper is printed from material consisting largely, and often almost wholly, of wood pulp, which is also used in the production of nearly all common and medium grade of paper for almost all uses, the magnitude of the consumption of wood in pulp-making becomes apparent.

French Technical School.

Francis B. Loomis, commercial agent of the United States at St. Etienne, France, gives an interesting account of the model, well-organized and successful technical school at St. Etienne. At this school, several trades are practically and theoretically taught, and the teaching is entirely gratuitous, the Government deeming itself well repaid by the production of intelligent and educated artisans. Perhaps the most important trade taught at Etienne is that of cabinet-making. The apprenticeship is four years in duration. At the end of four years a certificate of aptitude is given, which enables the lad to obtain a situation in the line of industrial labor which he has chosen. The work at the school commences each day at 7 o'clock in the morning and is finished at 7 o'clock in the evening, with an interval of one and a half hours for dinner.

The lectures are of two kinds. The first are common to all students of the same year, and embrace general subjects, while the second are exclusively technical and are special to each section. In the first year the students pass through all the workshops to be initiated in the proper handling of the different tools, whether of iron or wood. After this period, the boys are classed ac-

cording to their tastes, desires and aptitudes. They work at manual labor three hours daily during the second year, four hours in the third and five in the fourth and last year for the first half, and seven in the last six months, in order to become accustomed to the burden of a day's work. During this period, also, special attention is paid to the teaching of the theory of the different trades. Very careful attention is paid to design. The apprentices at all the trades are obliged to follow the instructions given on this subject, which is rightly considered of the greatest importance in the school. Designs of various kinds are executed with great taste by the more advanced sections, and every year an exhibition of the work of the boys is held. The results of this school have been most excellent, and I am informed that, as a rule, its graduates become self-sustaining members of society in a very few months.

SCIENTIFIC PROGRESS.

The Solarometer.

Wm. H. Beehler, Executive officer of the U. S. man-of-war Pensacola, now at Mare Island Navy Yard, has recently invented a peculiar scientific instrument called a solarometer, and has patented it through the MINING AND SCIENTIFIC PRESS Patent Agency.

The solarometer is about three feet in diameter and will rise above the deck of a vessel about six feet. A constant level base sustains a system of concentric sphere rings and fittings that allows the apparatus to remain level at all times. The entire apparatus resembles very much a ship's binnacle and will be similarly fixed in position. On the top is a stellar globe, having an exact representation of the fixed stars and constellations visible in the skies clearly marked on its surface, together with the meridian lines, equator and the ecliptic for one year, surrounded by a horizon ring mounted on a flat stand and provided with apertures. It is by means of these astronomical arcs that latitude and longitude are determined.

In all observations taken at sea with a sextant the horizon plays a prominent part. The sun is often plainly visible, yet correct latitude and longitude cannot be taken, because the horizon line is not visible. The solarometer works independently of the horizon. What has made the use of this instrument possible as well as practicable, is a book of azimuth tables, the first of which was issued in 1884 by the Government.

The solarometer is constructed upon scientific principles of nautical astronomy, and it facilitates the observations of celestial bodies. It does away with the use of logarithms and elaborate calculations to solve problems in navigation. With this new instrument observations can be made at any time day or night when any celestial bodies are visible.

Local apparent time or observers longitude, observers latitude and the compass error can be indicated by it at the instant it is used on any celestial body. It can also be used for rating chronometers, especially when the latitude and longitude are accurately known. The facility with which it can be used and the accuracy of its indications constitute a reliable indicator of a vessel's speed at sea for any length of time between observations.

A nautical almanac, a chronometer and a book of azimuth tables are used in conjunction with the solarometer to determine locations at sea. The chronometer must be regulated for Greenwich mean time, which must be converted into Greenwich apparent time by applying the equation of time as given in the nautical almanac. The book of azimuth tables is a volume giving the true bearing of celestial bodies for every ten minutes of local apparent time, for every degree of latitude from the equator to 70 degrees north and south and for every degree of declination from zero to 90 degrees north and south. The approximate local apparent time is used as ascertained by applying approximate longitude to the Greenwich apparent time. The approximate latitude is used with the declination from the nautical almanac. With these quantities the approximate true bearing of the celestial body to be observed is found in the book of azimuth tables to be published for use with the solarometer.

Lieutenant Beehler has been working on this invention for a number of years. On July 30, 1891, he secured home and foreign patents. The reason given for keeping the invention a secret so long is that a publication of the details would have made it impossible to secure many of the foreign patents. A manufactory for the produc-

tion of solarometers will be established at Baltimore, Md., within a very short time.

"I was a passenger on the Pacific Mail steamer Costa Rica when she was lost on this coast in September, 1873," said Lieutenant Beehler, "and I firmly believe that a solarometer would have obviated that disaster. There are numerous other losses of a similar nature that I could mention. Another case in which this invention will be appreciated is where ocean steamers make from 300 to 500 miles a day, and with a sextant the exact time can only be taken once in 24 hours. This is too long a time to elapse, where so many miles are covered, without a full determination of location."

The Improvements in Aluminium.

But a very short time ago, comparatively speaking, both aluminium and magnesium were regarded as purely chemical wonders. Owing, however, to the vast improvement which has been effected in the manufacture of these metals, and the energy with which such manufacture has been pursued, they are utilized to-day for nearly every kind of manufacturing purpose. In many parts of the world there are established important aluminium and magnesium factories, but perhaps one of the most extensive and successful is that known as the Hemelingen Fabrik, situated near Bremen, in Germany. At this establishment, aluminium and magnesium are made for every purpose to which they can be adapted, and a representative of *Machinery*, who lately finding himself at Bremen, writes to say that he went all over the works belonging to this important firm, being shown every part of the important manufacture from its very beginning.

Not only have aluminium and magnesium a distinct technical value in their pure state, but they are extremely useful for blending with other metals. Magnesium has always been in special favor for lighting and optical purposes in signaling, fireworks and photography, but now that its value is raised as a blending agent, its sale and demand are likely to be considerably increased. One of its principal recommendations is that it cleanses the metal with which it is blended from all impure parts, which effect cannot be procured without its assistance, and especially when casting is resorted to. For this purpose, then, magnesium is now added to copper, and owing to the eminently satisfactory results attained, the Hemelingen Fabrik has been further induced to try the experiment of adding magnesium to a quantity of German silver, brass and nickel, with the result that the experiment has proved surprisingly satisfactory. The proprietors have discovered also that a slight addition of magnesium to German silver prevents the evil of zinc and nickel oxide from remaining. The same effect, we understand, is obtained by the addition of magnesium to nickel, while at the same time the addition considerably promotes the value of the metal. It is also known that nickel treated in this manner is much easier to handle while the hammering, turning and drawing processes are being carried out. Most of the leading German nickel manufacturing firms are already purchasing large quantities of magnesium from the Hemelingen Fabrik, the result of the experiment being known to have been thoroughly satisfactory. From what the correspondent says, the Aluminium and Magnesium Fabrik can fairly claim to have rendered a great technical and industrial service by reason of its discovery, a fact which has been duly recognized by the highest German State authorities.

Dust in the Atmosphere.

Prof. Aitkins, an English Scientist, shows the air to be full of minute particles of dust. Outside air at Colmonell in Ayrshire contained from 8000 to 155,000 particles. Near Falkirk the smoky atmosphere showed from 180,000 to 2,296,000 particles per cubic inch. Glasgow air showed from 2,750,000 to 7,500,000 per cubic inch, and Edinburgh air from 750,000 to 4,000,000. In the meeting-room of the Royal Society, when showing the Fellows his experiments, 4,500,000 were counted just before the meeting, 6,500,000 near the close of the meeting, 49,000,000 near the ceiling just before the meeting, and 57,500,000 near the ceiling at the end of the meeting. In his own laboratory he calculated 30,000,000 of dust particles in the cubic inch of air; near the ceiling, 88,000,000; and above a Bunsen flame the infinite number of 489,000,000. A cigarette smoker sends 4,000,000 of particles into the air with every puff he makes. Mr. Aitkins' observations, during the summer of 1889, were made on the Continent to find out the minimum number of particles in natural air untouched by artificial causes. At Hyeres, near Toulon, the number per cubic inch varied from

48,000 to 384,000; the latter when the wind was blowing from the town. At Cannes the lowest observation was 24,000, when the wind was blowing from the town. The sea air at Hyeres contained 28,000; at Mentone, 80,000, with a steady wind from the sea, and at Cannes double that number. At Lucerne, in Switzerland, the specimens of air tested were remarkably free from dust; on the Rhigi mountains the minimum was 3360 particles. In the purest Highland air in Scotland, tested by Mr. Aitkins, he found the minimum to be 32,000 particles per cubic inch.

ELECTRICITY.

A Big Proposition.

Monday night, at the meeting of the Board of City Trustees, during the wrangle and discussion over the proposed franchise for the new "Electric Light and Power Co.," an important piece of news leaked out. It is no less than a well-developed scheme to harness the big volume of water in the Sacramento river that flows to waste by this town, and converting it into power for running all kinds of machinery. The Redding Water Co., and Electric Light Co.—the two concerns practically under the same management—are behind the scheme. They propose to take the water out of the river at the lower end of Turtle Bay, and convey it through an open cut or ditch across the old Oliver land to a point on the river near the free bridge. The water right has been located and recorded and the survey for the ditch has been made. The survey revealed the fact that at the point on the river where the company expects to erect the power plant they will get 14 feet fall at low water and 7 feet fall at high water. They claim they can develop anywhere from 800 to 1000 horse power with the 7-foot fall. This, too, during the flood or high water stage of the river. Already, so we are informed, the company has put up a capital of \$20,000 to commence development work on, and have also purchased a large amount of 12-inch main pipe for the water company, which will be laid to connect the reservoir on the hill with the new power plant, and in a few days the contract will be let for excavating the ditch. The company will run the water works and the electric light plant with this power, and will also furnish electric power to anybody who may want it. In connection with this enterprise, another company propose to connect with the ditch and carry it on down to Cottonwood for the purpose of irrigating the bottom lands between Redding and Cottonwood. This is entirely practicable, and the scheme will add immense wealth and prosperity to the county if carried out.—Redding (Shasta Co.) Democrat.

Military Telephony.

During last year's autumn manoeuvres in Eastern France, an extensive use was made of the telephone at the direct instigation of the Minister of War. Batteries not being available, magnetic telephones had to be used exclusively, the receiver being fastened to the headgear, while the transmitter was held in the hand. A combined receiver and transmitter was also tried, of 50 mm. diameter and 400 gr. weight. A bare bi-metallic wire of six mm. diameter, with earth return, was used. A good earth was obtained by fixing a bayonet in the ground. Mounted soldiers connected the earth line with the bridle of their horses and the current went to earth through the hoofs of the horses. Two men formed a telephone attachment. One carried the telephones and a movable drum weighing 2½ kg., on which 1000 m. of wire was wound; the other carried a light bamboo cane with a hook at one end, and also a drum with wire. The two men could thus lay a line of 2 km. The man with the telephones walked at a quick pace, whereby the wire on his drum was unwound, and his comrade followed and laid the wire over branches of trees, hedges, walls and in ditches to preserve it from injury as much as possible. In one of the trials, a line of 23 km. length, with an intermediary station, was laid in five hours; the transmission was perfect, and the whole line was taken up again in one hour. Earth shunts seem to have but little influence. During a sham fight on the 7th of September, a line of 12 km. length worked without interruption, although a whole division of cavalry passed over the line. The cost of 10 km. wire, ten drums, three telephones and five bamboo canes amounted to £7 8s.—Electricity.

AN INDUSTRIAL REVOLUTION.—The City Council of St. Etienne has decided to

apply electric motive power to all the hand-loom in the city, and contracts have been made with an electric company for the necessary plant and currents. The electric dynamos are to be driven by water from the city reservoirs. There is practically an unlimited supply of water in the reservoirs, with a fall of upward of 100 feet. The cost of producing the electricity will be reduced to the lowest point possible. To grasp the importance and far-reaching results of this innovation, says *Electricity*, it is necessary to understand that the bulk of the enormous output of ribbons (£4,500,000 a year) is the product of house industry. The weavers for the most part own their own looms and operate them by hand in their own houses. There are 18,000 looms which are thus distributed among the homes of the weavers, while the number of looms driven by steam in the few ribbon factories of the town is only 5000. The 18,000 looms of the independent weavers are valued in the aggregate at £900,000. What the city of St. Etienne proposes to do is to convert each one of the 18,000 hand-loom into a power loom driven by electricity. Electric light will also be furnished. The result of this change from slow, laborious, uncertain hand-power to the swift, regular, unfailing power furnished by electric motors will be an increase in the productive capacities of the looms and a considerable reduction in the general expenses of fabrication. According to the report of the American Consul, the weavers of St. Etienne have always been the most artistic ribbon-makers in the world, but they have enjoyed few mechanical advantages. Now the old order of things is to be changed, and the products of the St. Etienne ribbon looms, which have been a trifle more costly than similar products in some other countries, notably in Switzerland, will be turned out at the lowest possible prices. The work people employed in the ribbon trade number 70,000.

The Vacuum in Lamp Bulbs.

One of the most interesting stages in the progress of the manufacture of incandescent lamps, says T. R. Taltavall in the *Electrical Age*, is the exhaustion of air from the bulbs, and the life of the lamp depends more upon the success of this part of the work than anything else.

Human beings cannot live without air, but electric lamp filaments cannot live with air, the oxygen in the air which is so essential to the support of animal life is fatal to the life of an incandescent lamp filament. The carbon of the filament oxidizes very readily when heated in the air, and for this reason it is necessary to confine it within a bulb from which the air has been exhausted.

The exhaustion of air from lamp bulbs is accomplished by means of vacuum pumps, and it must be conducted with great care, as it is at this stage of lamp-making where the greatest difficulties are met. Mercurial pumps are used for the exhaustion of air, among the best known of which are the Sprengel and Geissler. Mechanical pumps are usually employed to hasten the process in its first stages, mercurial pumps being afterward used to complete the work. The mechanical pump cannot produce as high a vacuum as is necessary for lamps, while the mercurial pump can produce a higher one than needed.

A word about the mercurial pumps will be of interest.

The Geissler mercurial pump is a modification of the apparatus used by Torricelli in his experiments which led to the invention of the barometer, the space between the top of the column of mercury in the barometer tube and the top of the tube itself being called a Torricellian vacuum. The Sprengel pump is somewhat simpler than the one just referred to, and is thought by many of those who have used both to be capable of producing a more refined vacuum.

To give a general description of the action of these pumps in practical operation, it may be said that the bulbs to be exhausted of air are connected with that portion of the tube containing the mercury where the vacuum exists, and then in creating the vacuum, the air contained in the bulb is carried off with that in the tube. When the proper degree of exhaustion has been attained, the bulb is melted off at the neck by a glass blower and the lamp is then ready to be finished.

The process of exhausting the air from lamp bulbs is similar to driving a swarm of flies out of a room. It is a comparatively easy matter to get a large number of them out, but when few remain the hard work begins. So it is with the air in the bulbs. It is easy enough to get most of it out; the hard labor comes when we get to the last of it.

After the air has been sufficiently exhausted from a bulb, there remains less than one-millionth part of the original quantity.

USEFUL INFORMATION.

A NOVEL FOUNDATION.—A novel foundation was used in building a lighthouse at Gull shoal, on Pamlico sound, North Carolina, says *Engineering News*. The building was to be founded on screw piles and preliminary borings indicated firm material. When work began setting the piles, however, it was found that, although at first penetration was difficult, after ten feet depth was reached, there was little resistance to the turning of the screw. The soft layer appeared to extend deeper than the piles were intended to penetrate, and it was not thought prudent to test the lighthouse on the piles without some additional means of support. It was therefore decided to surround each pile with a cast iron sleeve, 1¼ inches thick and 11 feet long, provided with a disk of the same material, 5 feet in diameter, intended to bear on the hard upper stratum of the shoal. This scheme had been tested, and proved economical and effective at another station in the same lighthouse district. The piles were screwed to a depth of 13 feet, and the sleeves were dropped over them after bolting the disks on to the lower end. The sleeves were secured to the piles by set screws. The lighthouse is a hexagonal wooden building, and is supported on seven piles.

BORING HOLES.—For boring long, deep holes that do not go clear through the pieces so as to permit of using a boring bar, use a tool having right back of it a set screw which may be run out so as to touch the opposite side of the bore from the one the tool is working on; and have half way between these two, so as to touch the circumference of the bore hole 90 degrees from the tool and 90 degrees from the first screw, a similar screw which may be adjusted so that the tool will be kept centrally, and the hole kept straight. If the job be such as to permit the hole being bored vertically, there will be no trouble about getting out the borings or having them crowd under either of the set screws; but if it must be a horizontal job, the tool must be rigged so that one of the screws shall be at the top and the other at one side, the tool being on the other side.—*Engineering Magazine*.

DYNAMOS IN PARALLEL.—To stop a dynamo running in parallel with one or more others or with a storage battery on the same circuit (usually constant potential) regulate down its E. M. F. until it is only slightly greater than that of the circuit (about one per cent) and its ampere meter shows that it is producing very little current. The switch connecting it to the circuit should then be quickly opened. Under no circumstances, however, should a dynamo in parallel with others or a battery be stopped, slowed down or have its field magnetism discharged or weakened (*i. e.*, more than enough to regulate its E. M. F., as stated) until its armature is completely disconnected from the circuit, as it might be burnt out or driven as a motor if its E. M. F. fell more than a few per cent.—*Electrical Engineer*.

OIL is apparently to be used instead of coal under the furnaces at the World's Columbian Exposition. The lowest bid for coal was \$2.44 per ton, while the Standard Oil Co. offered a 42-gallon barrel of oil for 70 cents. As this company claims that three barrels of oil are equivalent to one ton of coal in heat-giving qualities, the oil is cheaper than the cheapest coal, and the management favors the oil provided it can get it for 70 cents per barrel until 1893, and thereafter at the lowest market price, not exceeding 72½ cents per barrel. The lowest estimate made of coal required is 75,000 tons, and on this basis at least 225,000 barrels of oil would be wanted—probably the largest quantity ever sold to one consumer.—*Engineering News*.

WARNING CARS.—The Midland Railway Co. of England are trying the experiment of warning their cars by means of hot water from the boiler of the locomotive, the arrangement being in operation upon the express trains. The contrivance is a simple one, and so far seems to have met with success. The pipes pass through each of the compartments in the train; the driver has control of the apparatus, and so regulates the process as to produce the required heat, and the pipes, when not in use, are emptied, thus preventing their freezing in severe weather.

It has lately been found that the brilliant light emitted by an electric welding machine when at work is very injurious to the eyes of those using it. In one case where the welding of iron vessels by the Bernardos process

was being done, the best protection that blue glasses could afford proved insufficient, as the sight of the operators suffered considerably after a few months' work. It may be suggested that yellow non-actinic glasses would be better.—*Industries*.

AN improved form of wood screw is one which has on the under side of the head a series of teeth or serrations for the purpose of forming a countersink to enable the head to sink into the wood and lie flush with the surface.

GOOD HEALTH.

Massage Treatment.

The word massage signifies motion and pressure applied to parts of the living body for curative purposes. Massage is the application of motion and pressure to the soft tissues of the body by the hand of the operator, and should be given under the guidance of the educated and experienced physician. Massage is not good for every disease which afflicts the human family, and a knowledge of anatomy and physiology is essential to the proper application of massage, which is based on plain physiological laws, and has nothing in common with magnetism; nor is it a form of exercise or gymnastics, or a system of rubbings. There should be no surface friction or skin rubbings in the proper massage treatment. In a general way, without going into details, it may be described as a system of kneading, compression, rolling, wringing, percussion, and vibrating the soft tissues of the body. The Swedish movements are a system of slow motions, with and without resistance, made by the director or physician. They are often combined with the massage treatment. The rationale of this method of treatment is that the circulation is invigorated, oxygen is carried to the tissues more rapidly, the blood is purified more effectually, and the carbon and debris of the body are liberated more freely. This is done without any expenditure of will power or nerve force. Old adhesions are broken up, and inactive muscles are brought into action. The forces of the organism are mostly expended through the circulatory and muscular systems, and less vital energy is exhibited in the nervous. The expenditure of vital power is accelerated. It is a law of vitality—of all living things—that the development of vital power and strength is accomplished only by augmenting the expenditure of this same power. The athlete knows by continuous effort and exertion that by great expenditure of vital power he can gain the strength and power to perform his herculean task. So the horse trainer is aware of this law, and takes advantage of it in developing his horses. This is the philosophy of the massage and Swedish movement treatment. It is not only adapted to the sick and diseased, but is a method of treatment highly beneficial to the business man or woman whose incessant application in the office has enfeebled his or her vital energies, and made them feel the need of recuperating their physical powers.

"Seeing Snakes."

There is an optical illusion, usually the result of debilitated health, consequent on over-indulgence in alcoholic liquors, that frequently takes the form of "seeing snakes." An authority thus explains this phenomenon to the *Optician*: The eyeball is covered by a network of veins, ordinarily so small that that they do not intrude themselves visibly in the path of the light that enters the sight, but in the course of some disease these veins are frequently congested and swollen to such a size as to become visible, and when this happens the effect generally is to appear as if there were an object of considerable size at a distance from the eye. Of course, this vein is generally long, thin, and sinuous, like a serpent, and the figure seen is frequently startling like a snake. That they seem to live is due to the fact that they are often not in perfect line with the direct front of sight. They are either to the side, up or down from the focus, therefore, when discovered, the victim naturally turns his eyes toward the effect, and the effect, of course, moves away. The eye follows, and thus a continuous and realistic motion is obtained. Now, if the eye be quickly turned to the front again, it will see another snake, which, if watched, will glide away in the same manner. One individual who was afflicted with malarial disease, and had his eyes thus congested, had strange shapes and clouds pass before his vision, which, if he were in a state of nervous collapse, might easily have taken the form of the shapes seen by those suffering from delirium tremens.

MINERS AT NEVADA CITY.—A mass meeting was held at Nevada City on Saturday evening last, being in the form of a reception to the president, secretary and nine members of the Executive Committee of the California Miners' Association. The meeting was called to order by A. Tregidgo, president of the Nevada County Miners' Association, who introduced Hon. J. H. Neff, of Colfax, president of the State Miners' Association, as chairman of the meeting. After Mr. Neff's address, speeches were made by Hon. John F. Davis of Calaveras, who was followed by W. C. Ralston, Wm. Irelan Jr, Senator E. M. Preston, Hon. M. H. Mead, S. K. Thornton, Major J. S. McBride and Judge Dibble. Resolutions were adopted thanking the delegates at Washington. The San Francisco delegation was given a banquet, and altogether the meeting was a great success.

ROBERT S. McMURRAY, one of the California Miners' delegates to Washington, returned to San Francisco this week, accompanied by Major Frank McLaughlin, who spent some days in Washington with the delegation. Both gentlemen are hopeful of favorable action by Congress on the debris bill.

SEVERAL new buildings will shortly be commenced at Palo Alto, mainly dormitories for accommodation of students. There are now about 500 students at the university.

Mining Interests in Congress.

The near approach of the time when delegates will have to be chosen to the State Conventions of the respective political parties should this year awaken the interest of practical mining men, who are accustomed to pay little attention to politics. The same men who will now assemble in the spring and summer to choose delegates to the National Conventions at Minneapolis and Chicago, will reassemble later in the year to nominate Representatives to Congress. We have a cause to be championed in the House, which is of more immediate importance to the miner than any mere question of politics or fiscal policy, and it should be seen to that men who are able and sound should be nominated by both parties.

The important mining sections of this State, with the exception of San Bernardino, lie almost wholly within the First and Second Congressional Districts, and it is to these districts primarily that we must look for advocates sincerely devoted to the mining cause. In the First District, unfortunately, things have so far shaped themselves that there is little hope for us to expect much comfort.

If we are to have a man upon whom we can rely to handle this subject in a broad and conservative yet energetic manner, we shall have to look to a representative from the mountain counties of the Second District. In that district the road is still clear to the nomination of men, who, instead of being lukewarm, would be active and energetic in all efforts for the rehabilitation of hydraulic mining on a just and equitable basis. No recent convert, who fought the miners or ignored them when they needed friends, and came in at the eleventh hour, should be sent to Washington this time. On the other hand, it may be urged that a man from either of the two mountain counties most directly affected might be an object of suspicion to the farmers. It would be a mistake to nominate a man who is open to either of these objections.

The Democratic party will probably give the nomination to A. Caminetti, of Amador, as the political courtesy of a renomination is generally given unless there is good cause against it. Mr. Caminetti has seconded the efforts of the Miners' Committee in Washington in a manner that is acceptable and is in accord with his record while a State Senator. But for the death of Geo. G. Blanchard of El Dorado, there is no doubt he would have been the Republican nominee, and he would have been a giant in the cause. As it is, the only Republican name thus far mentioned in connection with this nomination, against which there is no objection, is that of John F. Davis of Calaveras. Mr. Davis is by profession a lawyer, is a mine owner, is from a conservative community, and is a public speaker of a high order of ability. He is a new man, with a clean record, and etumped the district with Judge Blanchard in the campaign of two years ago. Since Mr. Davis' return from Washington, he has been a most efficient member of the Executive Committee of the Miners' Association.

Let us see to it that men upon whom we can rely are nominated upon both tickets, and then the interest of the miner will be promoted, whichever party wins.

MR. SKIFF, chief of the Department of Mining of the World's Fair, says that it is already assured that in the mines and mining building will be gathered in 1893 incomparably the largest array and most instructive evidence of the mineral wealth and progress of the mining industry ever collected or attempted.

J. S. MACARTHUR, one of the inventors of the MacArthur-Forrest process, is at Johannesburg, South Africa. Several people have written to us for his address, supposing him to be out on this coast.

The MacArthur-Forrest Process.

Not since the first experiments with the Russell lixiviation process, some years ago, has there been as much interest manifested in a new metallurgical process as that at present being shown in the MacArthur-Forrest system, sometimes called the "cyanide process." It is of particular interest to California miners, because it is especially adapted for working gold ores. As compared with chlorination, this cyanide process involves no roasting, and therefore no fuel; and may be utilized in regions where furnaces would be impracticable. It will also work ores which cannot be touched with profit by chlorination; and much less "chemicels" are necessary than in the latter process. This cyanide process also takes out both the gold and silver.

In the MINING AND SCIENTIFIC PRESS of March 26th was a full description of the process written by one of the inventors. In our number of last week was another article by a practical millman well known on this coast—Mr. A. B. Paul. This gentleman has made a number of experiments at Middle Creek, Shasta county, and has been twice to Denver to see the works there.

Mr. Paul gave in brief, in his letter last week, an account of what can be accomplished by this process. It was a surprise to many to be told that the heaviest sulphureted ores could be treated without roasting, and yet 95 per cent of the assay value be realized. This is a very important thing for this State, where we have so much sulphureted ore. Mr. Paul says it costs from \$2 to \$5 per ton to work ore by this process; and it is not necessary to first concentrate the sulphurets and then work them separately from the original ore. Mr. Paul says, "you can extract the gold and a high per cent of silver from any ore."

The big 100 ton mill at the Needles, San Bernardino county, will soon be in operation using this process, and we shall look forward to the results with great interest. One of the best metallurgists and millmen in the State has gone up to see the works under Mr. Paul's management at Middle Creek, and we shall be glad to hear his opinion of what has been accomplished there. Meantime, mine owners everywhere are anxious to gain all the information they can on this subject. In view of the renewed interest in this process, we shall republish next week the experiments of C. W. Merrill made at the metallurgical laboratory of the University last summer.

Why Congress was Asked.

The Truckee *Republican* does not believe that Congress will grant any appropriation for debris dams; and does not think it was worth while to go to Congress at all for relief. It wants to see the debris carried in a flume or pipe to the tule lands and there deposited. It suggests the formation of a company to do this, collect the gold and improve the lauds; and thinks the miners should carry out this or some other project themselves and not bother with Congress.

The miners did go to Congress for relief, not because they wanted to, but because they had to. The debris was injuring the navigable rivers, and these rivers belong to the Government. The decisions of Government courts were against even muddying the waters of the rivers. Where dams had been built to impound the debris, the mines discharging into these dams had been enjoined. Therefore it was useless to build dams without a special act of Congress authorizing them. For these reasons the miners went before Congress. If the Government itself builds debris dams it is not likely that the mines using them will be etopped; whereas, if the miners build them without Government authority, then work may be stopped.

A good many plans have been brought forward to put the debris on the tule lands. The trouble is that there is not fall enough

from the head of the valley, or foot of the mountains, down to where the debris is wanted. When the waters slow down their speed, where there is little fall, the debris being carried, no longer remains in suspension. It settles down and causes trouble. There is too much of it to be carried in a pipe or an ordinary flume, anyhow, and grade enough could not be given in the valley to carry it any great distance.

The Californians want to do this work themselves, if allowed to. If the Government will build a few typical debris dams in the main rivers, the miners will build auxiliary ones in the canyons near their respective mines. But nothing at all can be done at present, or until Congress sets the seal of approval on the report of its engineers.

The Tulloch Concentrator.

JAMES TULLOCH, of Angels' Camp, Calaveras Co., inventor of the ore-feeder and concentrator which bears his name, has just patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an improvement on his concentrator, which, as is well known, is of the endless belt variety. The improvements consist in suspending the endless traveling belt or apron from above by suitable swinging connections, and in imparting to the belt a reciprocating movement, whereby its surface describes a concave arc; also in a novel means of suspending the table; and in a novel mechanism for effecting what is known as the "uphill travel" of the belt.

The prime object of the improvements is to so arrange the endless belt or table that every point in its surface may describe a concave arc in swinging to and fro, in contradistinction to the convex arc which said belts have heretofore described, by reason of being mounted on movable standards below. This motion is considered by the inventor to be advantageous in better spreading the material over the surface of the belt, and in keeping it worked away from the sides thereof and toward the center, resulting in a more perfect concentration.

The shaking-frame of the machine, carrying the drums and supporting rollers, is mounted at an inclination, so that the belt is likewise so inclined and has an uphill travel.

Mr. Tulloch suggests several ways by which the belt or table may be suspended from above, but that which he prefers consists of inclined arms secured at each side of the frame near each end, said arms extending upwardly to and under the middle of the top bars to which they are freely hung by means of a link-bolt or jointed rod in the centers of the top bars, so that the belt or table is suspended centrally from above. By rotating the crank-shaft the belt or table is vibrated about its point of support above, and every point in its surface describes a concave arc, resulting in spreading the material upon the surface of the belt more generally and equally and in keeping it from packing upon the sides, directing it toward the center.

To effect the uphill travel of the belt, connected with the base frame by a loose joint is an actuating pawl directed by a suitable guide and having its upper end adapted to engage the teeth of a ratchet. As the table swings toward the pawl, the ratchet is brought into contact at each return stroke with the pawl, and as the ratchet swings through its upward movement it is turned one tooth at a time by its engagement with the pawl. This engagement of pawl and ratchet and the direct connection of the latter with the shaft of the head-drum makes a simpler device than those shown in the previously patented machines of the same inventor.

ADOLPH SUTRO delivered a lecture to the mining students at the State University last week, descriptive of the driving of the Sutro tunnel.

Machinery for Sizing Coal.

The adjustable bars, finger-bars and oscillating bars used in sizing coal at the iron breaker at Drifton are something like the Grizzly used on this coast, but are improvements upon it. The finger-bars E have been recently introduced. In using the old-fashioned continuous bars, part of the dirt and fine coal is often carried over the bar, and is delivered in the chute at the lower end instead of falling through; and as the spaces between the bars are parallel and closed at the lower end, long pieces often wedge and catch, particularly at the bottom, thus necessitating a frequent cleaning. Of the finger-bars, the lower end is entirely free, and the bars are narrower there than

the engraving have been introduced within a few years at the Cross Creek collieries for several reasons. They diminish the height of the breaker, because they are shorter and much flatter than the fixed bar of the same cleaning capacity. They act as a regulator or feeder for the breaker, the amount of coal passing over them per minute being constant if the supply is sufficient and the number of revolutions remains the same; while, by regulating the speed of the driving shaft, the quantity can be varied at will within certain limits. They allow the men upon the platform to get much nearer their work without danger. (With the ordinary fixed bars, the pitch must be sufficient to allow the coal to slide down freely. This it often does, with great velocity, so that

arc of a circle three inches long, while the center of the eccentric strap describes a circle three inches in diameter.

The center of the shafts (11 and 12) describes approximately an ellipse; that is, the center of 11 and 12 rises and falls three-quarters of an inch in moving forward three inches, and falls and rises three quarters of an inch in moving backward; but 12 is always above 11 when it moves forward, and below when it moves backward, and vice versa. The bars are flat on top, the extreme lower end (23) being rounded off to allow coal to roll off easily, then for a certain distance to the left they are horizontal, then they rise in a curve, the center of which is upward, to the point where the coal arrives upon the bars.

upward a little, advances beyond its adjoining half, which is moving backward, and thus pushes the coal forward. All the working parts, except the portion of the bars used for screening and the supporting shafts (11 and 12) are either covered, as is 28, or are on the outside of the iron sides (39) of the coal-chute. The bars are immediately over the mud-screen pocket, into which all the coal falls freely. Shafts (11 and 12) must be far enough apart to allow the large lumps passing through the bars to fall below them.

The essential difference between this construction and that of the Briart bar is, that in the latter the supporting shafts are driven directly by eccentrics, which involves the necessity of having the shafts which carry

PLAN OF DUMP, FINGER AND OSCILLATING BARS USED IN SIZING COAL.

at the upper end; and any lump that may wedge is likely to be loosened by the first lump which strikes it. Upon the vertical portion at the upper end are two half-holes, by which they are bolted to the beam or bar-bearings. In order to permit the varying of the opening as may be necessary, the bars are cast simply tapering from the top down, or with a greater or less projection near the top, like the old form. The holes are cast or drilled in the bearer for the greatest opening with the ordinary bar; if it is desirable to reduce the opening, the bar with the projection on the head is used. By changing the angle between the top of the bar and the back, a greater or less angle of inclination can be given to the bar, without changing the position of the bar-bearer.

The movable or oscillating bars shown in

the men must remain on the side. When the oscillating bars are used, the coal can be fed upon their upper end, from which it is gently carried to the platform. This allows the men to stand safely in front of the bars instead of on the sides. They bring the coal cleaner and with less small stuff to the platform, thus permitting a better separation of coal, slate, etc.

This machine, a modification of the Briart movable bars, consists essentially of a series of double bars placed sufficiently far apart to allow coal of the required size to pass between the bars of each pair. On the main or driving shaft (3) are two eccentrics (25 and 26) placed 180 degrees apart. At each end each bar moves two eccentric rods (7 and 8), which are suspended to the suspension bars 9 and 10. When the driving shaft revolves the points describe an

The upper ends of the bars which are carried by the rollers, are under the coal chute D. All the half-bars carried by 12 will be above those carried by 11 when moving forward, and below when moving back, while at the beginning and end of each forward motion they will be on a level.

The result is, that a lump large enough to straddle two half-bars of the same system will be raised by one set of half-bars, moved forward three inches and deposited on the other set at the end of the stroke, and will then be raised, moved forward and deposited on the first. In this way the coal will be moved forward six inches for each revolution, until it tumbles off at the end. It must be observed, however, that although the upper part does not rise when the half-bar moves forward, the other part is carried

the bars rise and fall the same distance as they move forward, while in this construction they only move up and down half as much as they move forward. It was found that, with the Briart construction, the coal was thrown up and down too much when it was fed forward with any rapidity.

In the engraving of these oscillating bars, 2 is the driving pulley; 3, driving shaft; 4, pedestals for driving shaft; 5, eccentric sheave for long eccentric rod; 6, eccentric shield for short eccentric rod; 7, long eccentric rod; 8, short eccentric rod; 9 and 10, suspension links; 11 and 12, carrying shaft for rod; 13 and 14, upper suspension pins on links; 16 and 17, lower suspension pins on links; 22 and 23, long-nosed and short-nosed bars; 25 and 26, eccentric straps; 27, planed roller surface on end of bar; 28, steel rollers.

EDWARDS' WORKS ON THE STEAM ENGINE.

The American Marine Engineer. Theoretical and Practical. With Examples of the Latest and Most Approved Marine Practice. For the Use of Marine Engineers and Students. By Emory Edwards, Marine Engineer. Illustrated by 85 engravings. 12mo, 435 pages. Price, \$2.50

Edwards' 600 Examination Questions and Answers. For Engineers and Firemen (Stationary and Marine) who desire to obtain a U. S. Government or State License. By Emory Edwards. Full bound in pocket book form, leather. 130 pages. Price, \$1.50

The American Steam Engineer. Theoretical and Practical; with Examples of the Latest and Most Approved American Practice in the Design and Construction of Steam Engines and Boilers of Every Description. For the use of Engineers, Machinists, Boiler Makers, and Students. By Emory Edwards, M. E. Illustrated by 77 engravings. 12mo, 419 pages. Price, \$2.50

Modern American Marine Engines, Boilers, and Screw Propellers. Their Design and Construction. Showing the Present Practice of the most Eminent Engineers and Marine Engine Builders in the United States. By Emory Edwards. Illustrated by 30 large and elaborate plates. 4to, 419 pages. Price, \$3.00

The Practical Steam Engineer's Guide in the Design, Construction and Management of American Stationary, Portable, and Steam Fire Engines, Steam Pumps, Boilers, Injectors, Governors, Indicators, Pistons and Rings, Safety Valves and Steam Gauges. For the use of Engineers, Firemen and Steam Users. Illustrated by 119 engravings. 420 pages, 12mo. Price, \$2.50

A Catechism of the Marine Steam Engine. For the use of Engineers, Firemen, and Mechanics. A Practical Work for Practical Men. Illustrated by 65 engravings, including examples of the most modern engines. Fifth edition, thoroughly revised, with much new matter. 12mo, 414 pages. Price, \$2.00

Modern American Locomotive Engines. Their Design, Construction and Management. Illustrated by 78 engravings. 12mo, 333 pages. Price, \$2.00

Send the above or any of our books sent by mail, free of postage, at the publication price, to any address in the world. 25 illustrated circulars, showing full tables of contents of all of the above valuable books, will be sent free to any one in any part of the world who will send his address

Our New and Revised Catalogue of Practical and Scientific Books, 38 pages, 8vo, as well as our other catalogues and circulars, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address

F. A. HUNTINGTON, PATENT ORE FEEDER. CENTRIFUGAL ROLLER QUARTZ MILL.

This Feeder is especially designed to feed the Huntington Roller Quartz Mill; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

THE BLASDEL CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Erie machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers; thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight rifled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight rifflings also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

 Office of General Manager,
 P. O. Address, South Riverside, San Bernardino Co., Cal.
 CAJALCO, Dec. 18, 1891.

MESSRS. ADAMS & CARTER, 132 Market Street, San Francisco, Cal.—GENTLEMEN: After a continuous trial of different concentrators comprising the Frue Vanner, the "Holland," "Paradox," "Triumph" and the "Woodbury" concentrators, extending over several months, we find that we prefer the Frue Vanner, as it is easier of adjustment, runs smoother, has less wear and tear, and—having a positive travel—gives less trouble than the other more complicated and ever changing machines now in use here. The Frue Vanner not only saves a cleaner concentrate, but has less loss in the tailings, and is in several ways preferable to the other concentrators here.
 I am, my Dear Sirs, Yours faithfully,
 S. HARRIS, Manager.

The New Pulsometer.

The pulsometer steam pump is a piece of mechanism, the operation of which, though simple, is not always clearly understood. In form it is a single piece of casting formed in one piece, consisting of a pair of working chambers, side by side, joined at their top ends by tapering necks with a third chamber situated between them. These three chambers are connected at or near their bottom ends with certain passages, which are covered with suitable valves, and are also provided with an inlet and outlet opening for water, and at their top ends with means for connecting with a steam pipe leading to boiler.

It is only necessary to place the pulsometer in the desired position, and connect it with the proper suction and delivery pipes and with a steam supply, when it will, by opening the steam valve, perform within its scope all that the most complicated steam piston pump can do.

Its two working chambers fill and discharge alternately just the same as a steam pump, but it has no piston. The level surface of the water within the chamber serves as a piston.

The steam enters at the top, or neck, of pump, and passes into whichever chamber the position of the steam ball valve permits, and pressing upon the surface of the water therein, forces it down and out past the discharge valves and through the discharge pipe. So soon as the water line has been forced downward to the discharge outlet, the steam above it instantly condenses, owing to the peculiar construction of the pulsometer, and a vacuum is formed, and the chamber in consequence suddenly fills again.

Now, while the steam is entering this chamber, which we will designate as the "left-hand" one, the steam ball valve is seated over the entrance to the "right-hand" chamber, preventing the entrance of steam thereto, but so soon as the sudden collapse of steam occurs, it is instantly drawn over to its seat at the entrance to the "left-hand" chamber, thus cuts off the admission of steam thereto, and allows it to enter the other chamber and expel the water therefrom in the same manner as described for the "left-hand" chamber.

The steam and water occupy the same chamber alternately, and will thus alternate, keeping up a continuous outflow as long as steam and water are supplied.

Referring to the sectional view, it will be seen that this pump consists principally of two bottle-shaped chambers, A, A, joined together, with tapering necks bent towards each other, to which is attached, by means of a flange joint, B, a continuous passage from each cylinder leading to one common upright passage, into which a small ball C, is fitted so as to oscillate with a slight rolling motion between seats formed in the junction. These chambers also connect by means of openings with the vertical induction passage, D, which openings are so formed that the valves, E, E, and their

seats, F, F, may be easily inserted. The delivery passage, H, which is common to both chambers, is also constructed so that in the opening that communicates with each cylinder can be placed the valves and valve-seats, G, G, of the same style as in the induction passage. I, I, are valve-

the suction seats, valves, and guards, are tightly pressed to place.

M, N, are brass socket headed bolts by which the discharge seats, valves, and guards are drawn down to place. A small brass air check-valve is screwed into the neck of each chamber, A, A, and one into

THE PULSOMETER AND SOME OF ITS APPLICATIONS.

guards to prevent the valves from opening too far. J represents the vacuum chamber, between the necks of chambers A, A, and connects only with the induction passage below the valves, E, E.

K, K, are flanges covering the openings to the respective chambers, so as to facilitate the removal therefrom of valves and seats when necessary. Vent plugs are inserted into these flanges, for the purpose of drawing off the water to prevent freezing. L, L, are rods extending from the valve-guards to the set-screws, M, M, by which

the vacuum chamber, J, so that their stems hang downward. The check-valve in the neck of each chamber, A, A, allows a small quantity of air to enter above the water, to prevent the steam from agitating it on its first entrance, and thus forms an air piston, preventing condensation. The check-valve in the vacuum chamber, J, serves to cushion the ramming action of the water consequent upon the filling of each chamber alternately.

Requiring no foundation, the pulsometer may be hung up or set down in any convenient place. In a suspended position it is

used for making wells and shafts, and in positions where it is impossible to make a foundation for a pump. It may be hung from a projecting beam or from a pole or tripod and arranged with suitable tackle to be lowered or raised. Flexible steam and water connections are provided for the purpose. In quarrying and rock excavations, where blasting is necessary, the appliance may in a moment be lifted out of danger by a derrick and put quickly in position again. Two of these applications are shown in the engravings. The Parke & Lacy Co. of this city are the local agents for this appliance.

Another Ship-Building Plant.

It has been definitely settled that the Risdon Iron Works of this city will start a ship-building plant shortly, the only question now being the exact location. The city of Vallejo, on the straits at the head of San Pablo bay, opposite the Mare Island Navy Yard, offers the works 40 acres of land, all the necessary water frontage, and a handsome bonus in money if they will put the plant there. This offer is tempting, but it is hardly probable it will be accepted, owing to the distance from the city. Oakland is a much better place, but all that has been offered over there is a series of resolutions of the Board of Trade and a general principle promise of aid.

But resolutions and general principle offers of moral aid, do not build shipyards. The Kentucky corporation which controls the water front of Oakland is by no means liberal in its views, and wants an exorbitant price for its water frontage. In addition, the land for the works must be purchased and the plant provided.

Other cities in the United States which are alive to their own advancement generally lend some practical aid to an industrial institution employing many men. But Oakland has earned no reputation for enterprise in any direction, and seemingly does not care for it.

A big ship-building plant such as the Risdon people contemplate will be a good thing for the place where it is located. A couple of thousand men will be employed, the direct and attendant advantages of which are easy to recognize.

The Union Iron Works have practically demonstrated our capability to build vessels of any class here on the Pacific Coast, and as the Government appears to intend building many more vessels for its navy, there is room for other yards as well. It is manufacturing establishments such as these which will build up and maintain the cities around San Francisco bay. Our industrial establishments are now far too few, and every encouragement should be given to new ones, especially those which are to carry on business on a large scale. This port is destined to be a great ship-building locality, and it is a matter of congratulation that an institution with the reputation and standing of the Risdon Works should have decided to establish a new and first-class plant.

The MacArthur-Forrest Process.

Experiments in the Metallurgical Laboratory.

[In view of the increasing interest in all details concerning the MacArthur-Forrest process, we republish the following articles, furnished to the MINING AND SCIENTIFIC PRESS by C. W. Merrill, giving the results of experiments carried on at the metallurgical laboratory of the University of California. The object of the experiments was to give the process an impartial investigation as to theory, and to look into its practicality as far as possible on a laboratory scale.—EDS. PRESS.]

The following is a brief outline of this process taken from the statement of J. S. MacArthur before the Society of Chemical Industry, as published in the journal of that body for March 31, 1890.

"The ore is ground to about the fineness of sea sand, * * * this is then mixed with a solution of cyanide. * * * The ore and solution are then stirred for about six hours.

* * * In practice the time required is determined by direct experiment. When the gold is known to have been dissolved, the pulp is discharged into an ordinary filtering tank, where the filtration may, if necessary, be assisted by suction, and where the ore is washed by water or by the waste cyanide from a previous operation. * * On allowing the cyanide of gold solution to trickle through a mass of zinc (prepared in a form like sawdust, porous and with a large surface of bright metal,) we found that it trickled out gold-free, and better still, we found that the action became more vigorous and pronounced after a portion of the gold had been precipitated on it. * * *

When the gold has been deposited, it is necessary to separate it from the excess of zinc present. * * * The filiform mass of zinc with gold powder adhering is vigorously shaken in water, when the gold falls off and the fibrous particles of the zinc may be collected in a sieve. The gold settles easily, is collected, and fused directly into bullion."

The above was the method in its infantile outline, and below will be found a minute, detailed description of the process as it is said to be carried on at the mills of the company, or licensed by the company, at the present time. I quote from the circular of the company possessing the United States patent rights and from the description of a plant in Idaho, as described in the MINING PRESS of May 22, 1891.

The ore (usually sulphurets) is crushed dry to pass a 40 to 60 mesh screen. It is then mixed with the cyanide solution in proportions which vary from two parts by weight of ore, equal to one part by weight of solution to equal parts. The solution may be from one-eighth of one per cent to one per cent of pure KCN, according to previous experimental determination on a small scale with the given ore. The mixture is then agitated, either in revolving barrels or in ordinary pans with stirrers, for a period varying from four to eight hours, after which it is drawn into a tank provided with a false bottom for filtering. After filtration the ore is washed either with water or with waste solution from a previous operation. The filtrate and washings are then run slowly through a filter of zinc turnings. The barren solution may then be tested volumetrically with silver nitrate for the amount of active cyanogen, and regenerated by the addition of KCN to the required strength. The gold is shaken from the zinc turnings and recovered as above described. Whenever necessary, zinc turnings are added to the filter.

Now, being desirous first to see if there was anything in the process, I performed a series of experiments, using one assay ton (about 30 grms.) of concentrates, sampled to 80 mesh and not acid in reaction, and 200 cubic centimeters (200 grms.) of one-half per cent solution, the proportion being, as seen, one part ore to nearly seven parts solution. These mixtures were placed in bottles and agitated in a Taylor shaker for about six hours, and then filtered through paper filters and carefully washed with a volume of water equaling the volume of solution used. The filter papers and contents were then removed and dried, the papers burned and ash mixed with the tails, which were then assayed by the ordinary crucible method. I treated thus six ores, and the results will be clearly seen by the following table:

ORE.	Ore Assay in Ounces.		Tails Assay in Ounces.		Percent- age Extracted	
	Au.	Ag.	Au.	Ag.	Au.	Ag.
I. (a) Oregon Pyrites.....	18.825	15.35	13.38	11.02	26.32	26.7
(b) Oregon Pyrites.....	15.3	12.6	14	17.69		
(c) Oregon Pyrites (4% solution).....	13.85	9.97	26.4	35		
II. Zinc Blende Concentrate.....	1.545	3.44	.93	2.69	39	21.8
III. (a) Calaveras Pyrites.....	5.925	32	.82	17	56.16	45.13
(b) Calaveras Pyrites (treated twice).....	.3	10.39	93.83	68.47		
(c) Calaveras Pyrites (treated twice).....	15.26	11.8	2.97	1.72	80.14	85.42
IV. Shasta Pyrites.....	2.355	.775	.51	.29	78.35	72.58
V. Alaska Pyrites (treated twice).....	2.11	.68	.38	.09	82	34.48

By examining the results it will be seen that the percentages of gold and silver dissolved by the solution vary from 14 to 95, and 17.5 to 85 respectively. Being satisfied by experiment a on ore III that a large amount of the solution dissolved out 86 per cent of the gold and 45 per cent of the silver, I immediately went to work to test the second step in the process; *i. e.*, the precipitation of the gold and silver by zinc. This I did in connection with experiments *b* and *c* on the same ore (III). I treated them as I have described in the first part of the paper, except that I filtered them through sand filters and saved the tails and filtrates, introducing into the latter narrow strips of sheet zinc, which had been rolled out very thin and exposed a bright surface. The instant the zinc was put in, action commenced, the liquid became cloudy, bubbles of some gas escaped, and the zinc gradually became coated with a brown powder. In order to give this step in the process a fair trial, I allowed the zinc and solution to be in contact until no action resulted, when bright zinc was introduced. This took about 24 hours. Then, having removed the zinc, I filtered the solution, which collected any suspended particles in the filter paper. I then dissolved the zinc in dilute sulphuric acid and filtered the solution thus obtained, which contained suspended particles of gold and silver, through the same filter that I had used previously, so that I had all the gold and silver content. I thus treated the two solutions *b* and *c* of III. I now burned the filter papers carefully at a low red heat in roasting dishes and then removed the ash and contents to two scorifiers and scorified with 15 or 20 grams of test lead, cupelled and parted. I thus recovered from *b*, 5.22 milligrams gold, which equals 88.1 per cent of the gold content, and 16.26 milligrams silver, or 50.81 per cent of the silver content. From *c* was recovered 5.17 mg. gold, equaling 87.26 per cent, and 15.75 mg. silver, equaling 49.23 per cent. Having saved the tails, with the sand from the filter, I subjected each to a second treatment, saved the solution, and treated it as in the case of the first, and obtained from *b* .34 mg. of gold, equaling 5.73 per cent, and 5.65 mg. of silver, equaling 17.66 per cent; from *c* .45 mg. of gold, equaling 5.78 per cent, and 6.01 mg. of silver, equaling 18.78 per cent. Next assayed tails, and the result will be found in the tabulated statement below.

"b."					
First Sol.	Second Sol.	Tails.	Totals.	Assay Value	Per Cent of Assay Value Extracted.
Au. 5.22 Per Cent. 88.1	Au. 5.22 5.73	Au. 6.08	Au. 5.91 98.91	Au. 5.925 1.0	Au. 93.83
Ag. 16.26 Per Cent. 50.81	Ag. 5.65 17.66	Ag. 10.39 32.46	Ag. 32.29 100.93	Ag. 31 1.0	Ag. 68.47

"c."					
First Sol.	Second Sol.	Tails.	Totals.	Assay Value	Per Cent of Assay Value Extracted.
Au. 6.77 Per Cent. 87.26	Au. 4.5 7.59	Au. 3 6.06	Au. 5.92 99.91	Au. 5.925 100	Au. 94.85
Ag. 6.01 Per Cent. 49.23	Ag. 6.97 13.78	Ag. 28.03	Ag. 32 68.06	Ag. 32 68.06	

These experiments, as is easily seen, show conclusively that the zinc will precipitate all the gold and silver, if given time enough. As I see no reason why, on a practical scale, the pregnant solution cannot be made to run as slowly as desirable, the problem of the precipitation of the gold and silver, when once in solution, would seem to have been perfectly and neatly solved. This statement, however, must be modified in case the waste solution is to be regenerated. In this case, the minimum time in which the gold and silver will be precipitated must be ascertained. The zinc replaces the gold going into solution as a double cyanide of zinc and potassium. Now the amount of zinc that goes into solution varies directly with the time. The amount of cyanogen in this combination, $Zn(CN)_2 \cdot 2 KCN$, is totally inert, as regards further solvent power, as gold or silver will not replace zinc in such a combination, and only a double cyanide of a metal with an alkali is soluble. Thus it is seen that the longer the zinc and solution are in contact the less of active cyanogen (for dissolving gold and silver) will remain.

Being assured of the principle of the process and the practicality of the precipitation, I set to work to test the practicality of getting the gold and silver into solution, taking the proportions given as used in the Idaho plant, above spoken of, *i. e.*, 2½ parts ore to 1½ parts of solution, the solution to vary in strength from one-eighth of one per cent to one per cent, as determined experimentally. For this purpose I selected three ores, *i. e.*, the Oregon ore (which yielded in above experiments 20 per cent), the zinc blende concentrates (40 per cent), and the Calaveras sulphurets (92 per cent). I took four charges of each ore consisting of:

Ore 1 A. T. = 30 grms. (at prox.)

Solution = 30% = 18 grms = 18 cu. cm.

Charges No 1 was of ¼ of 1 per cent.
" " 2 " ½ of 1 per cent.
" " 3 " ¾ of 1 per cent.
" " 4 " 1 per cent.

The cyanide used showed by quantitative analysis about 50 per cent KCN, so for a 1 per cent solution would use 2 per cent by weight of the cyanide to 100 per cent by weight of water. The ores were tested as before and found neutral. Calcium chloride was added to the solution to neutralize any hydrate that might be present (as per directions), and the mixture of ore and solution was then agitated for eight hours. The experiments with the zinc ore gave anomalous results, which I afterward ascertained to be due to the fact that the ore contained 50 per cent silica, 37 per cent zinc blende, and 7 per cent galena, and had, owing to the great difference of specific gravity of the above components, become streaked in the bottle; in other words, was not homogeneous.

The results on the Oregon pyrites and Calaveras pyrites will be seen in the following table:

OREGON ORE.		CALAVERAS ORE.	
Per Cent Extracted.		Per Cent Extracted.	
1½ sol.....	3.1 10.5	1½ sol.....	Lost. Lost
2½ sol.....	17.1 19.4	2½ sol.....	51.4 20.2
3½ sol.....	13.5 14.2	3½ sol.....	63.8 19.1
4½ sol.....	10.7 14	4½ sol.....	37.4 24.8

The above results show, first, that the process is certainly a failure on the Oregon ore, from which 90 per cent of the assay value has been extracted by chlorination; second, that 85 per cent of the assay value of gold and silver may be obtained from the Calaveras ore by a one per cent solution, using 1½ parts solution to 2½ parts ore. I shall discuss the economy of the process further on. I was now reasonably certain that while the process might be made to work on some ores, the statement that it is without a peer as regards all refractory ores, and that "the most refractory ores can be treated for from \$2.50 to \$5 per ton," was not apparent from any actual test that I had seen. I was now desirous of finding out, if possible, why the process would extract so well from one ore and be such a failure on another. I thought this might be due (1) to the proportions of free gold mixed with sulphurets, or (2) to the chemical composition of the ore and its consequent action on the solution, or (3) to the manner in which the gold is imprisoned within the sulphurets, *i. e.*, whether each minute grain of the sulphurets contained the gold in such a mechanical form as would expose every particle of the gold successively to the action of the solution or whether the gold was so finely divided and so completely enclosed by the sulphurets as not to be subjected to the solvent action of the solution.

To test the first, I tried amalgamation and found that the Oregon ore yielded absolutely nothing, while the Calaveras ore yielded only a trace, *i. e.*, about 4 per cent, while the zinc ore yielded 33 per cent of Au by amalgamation. I could draw no satisfactory conclusions from these investigations. I next obtained quantitative analyses of these ores, which were as follows:

Oregon.	Zinc Ore.	Calaveras Ore.
SiO ₂23.10%	SiO ₂49.31%	Nearly pure.
Fe.....36.590	Cu......18	FeS ₂ + SiO ₂
S.....33.620	Fe......6.43	
Asenic.....6.304	Pb......6.39	
Sb......522	Zn......37.69	

From these again I did not care to draw any conclusion, except as to the zinc ore, which will be given below, without experimenting with a greater variety of ores of similar composition.

Then I took one-half A. T. of each of the three ores and roasted with N_2HCO_3 , obtaining the metallic oxides and N_2SO_4 . I then leached out the N_2SO_4 , and treated the residues repeatedly with strong nitric acid, panning off the sulphur, etc. Then finally I examined the residues with a strong microscope, such as is used in petrographical work.

(1) The Oregon ore showed no trace of gold in any form.

(2) The zinc ore showed the gold to have

occurred or collected into one minute filiform nugget.

(3) The Calaveras ore showed also a nugget, but in addition several granules of gold about one-tenth the size of the nugget. I believe from the above investigations (1) that the gold in the Oregon ore is so fine and so completely surrounded as not to be accessible in the raw sulphurets to the solution. (2) That zinc having the greatest affinity of all the known metals for cyanogen, rendered the KCN inert, according to the following reaction:

$4 KCN + ZnS = K_2S + Zn(CN)_2 + 2 KCN$
N, or possibly the formation of some sulphocyanide, the main point being the union of Zn with CN by direct combination or replacement, and thus causing the process to become partially inoperative in the case of the zinc ores. (3) That the gold was so combined mechanically in the Calaveras ore as to be almost completely accessible in the pyrites; and gold having a greater affinity for CN than iron, would displace iron in solution if the CN were insufficient for both. When I introduced KHO into a waste solution, after removing the gold, I obtained a precipitate of ferrous hydrate, which, on exposure, oxidized to the brown ferric hydrate, showing beyond the possibility of a doubt that some iron had gone into solution.

SOLUBILITY OF GOLD.

Noticing that Dr. Johnston, the chemist of the State Mining Bureau, found that it took dental gold 48 hours to dissolve in a quiescent solution, and also that the amalgamation results on the zinc ore would indicate considerable free gold, I tried 26.46 mg. gold in the amount of solution that would be used on that amount of gold, if contained in five assay tons, *i. e.*, about \$100 ore, on which the process is said to be most successful. That is, I took 5×18 cu. cm. or 90 cu. cm. of one per cent solution, and found that at the end of eight hours shaking, it had entirely dissolved, thus showing that if the gold was free and accessible in the zinc ore, as the microscopic examination would indicate, it would have dissolved had the KCN been a live and no zinc present.

ECONOMY OF THE PROCESS (WITHOUT REGENERATION.)

The most favorable ore experimented on assayed in gold 2.32 ounces to the ton and in silver .72 ounces. Of this was extracted, with a one-half per cent solution, using equal weights of ore and solution, 84.5 per cent of the gold and 66.7 per cent of the silver. Counting gold at \$20 per ounce, and silver at \$1 per ounce, the assay value of the concentrates was \$47.11. In chlorinating according to the reduction works in California, a return of 90 per cent would be made at a charge of \$20 per ton. That is, \$22.40 would be returned. Now, in the following estimate, I do not claim strict accuracy, but only the closest approximation that I am able to make. The prices for KCN and zinc were given me by a well-known dealer in San Francisco and were for large quantities. For one ton ore, according to above, we would need 2000 pounds multiplied by one-half per cent, equaling 10 pounds pure KCN. Now, platers' cyanide is said to contain 60 per cent KCN, therefore would require 16½ pounds platers' cyanide (which is the cheapest of the three grades sold per percentage of purity) at a cost of 45 cents a pound. That is at a cost of \$7.50. The replacement of the gold by the zinc uses but very little sheet zinc, which may be obtained for 7½ cents per pound. It would seem that a superintendent and one laborer could tend to a plant capable of reducing 10 or 12 tons a day, and the power required is very slight. To make a liberal estimate, including the consumption of zinc, and without taking into account the regeneration of the solution (which point I did not hear of in time to look into), I should say that \$10 per ton would easily cover the running expenses of a plant to reduce the above sulphurets. The first cost of plant where the ore has already passed a 40 mesh is very slight, merely consisting of revolving barrels, or tubs with stirrers, filtering tanks and zinc filter, with a few storage tanks. The above estimate, if correct, means a return of \$37.11 per ton in place of \$22.40. I need hardly call attention to the obvious advantages possessed by the process as regards mechanical manipulation. By far the greatest, however, is the doing away with the expensive and disagreeable roasting furnaces. The filtering in the case of sulphurets is ready and would seem to possess no difficulty. But as for the process being a panacea for all rebellious ores, I do not think the experiments of the owners themselves, some of which are as low as 65 per cent, show that, and I am certain that mine have not.

In the above, I am aware that many of my deductions may have been hasty, and I would be pleased to hear from any one on any such point.

The Great Mining Tunnel.

Adolph Sutro's Experience with It.

Adolph Sutro recently delivered an interesting lecture before the mining students at the University of California. In speaking of the development of the Comstock, he said:

New obstacles now developed themselves, one of which was the rapid increase of heat. As a usual thing, the increase of heat in nearly all parts of the globe amounts to one degree of Fahrenheit for every 60 feet of descent. On the Comstock the increase was more rapid, and when the mines had reached a depth of 2000 feet, it was a common occurrence to find the thermometer in the lower drifts rise to 110 degrees and over. Such a temperature, in an atmosphere saturated with moisture, is almost unbearable, and it would often take three men to one pick; that is to say, one man would work ten minutes or thereabout, and then retire to the cooling station, while the second man took his place, to again retire in order to make room for the third man, and so the rotation went on during eight working hours. The miners received \$4 per day. In this mode of working, a day's labor amounted to \$12.

I visited Nevada for the first time in the early spring of 1860, and, traveling over the country, saw at a glance what an advantage to the mines a tunnel would be driven into the mountain from the valley of the Carson.

Actual work on the tunnel was commenced in 1869, and it is my special object to allude to its construction and some of the obstacles encountered.

At first all the work was performed by hand labor, and the progress was slow; but as more ample means were procured, drilling machinery driven by compressed air was introduced and the advance was more rapid, amounting to an average of 300 feet per month.

Ten, twelve or fifteen holes would be drilled in the face on each side, going toward the center, so when all these holes were charged with dynamite and exploded by electricity a wedge-shaped mass of rock would be blown out from the center to a depth of six or eight feet, and afterward more holes were drilled on the side and similarly exploded, making an advance for the whole width of the tunnel of six or eight feet or thereabout.

After the tunnel had penetrated some thousands of feet, the air became worse and worse, and the heat commenced to increase. It was therefore necessary to have (besides the air derived from the drills) additional air thrown in by means of blowers placed at the mouth of the tunnel.

Here I will note a curious fact, which I have never seen explained, and which is worthy of close investigation by means of experiments. We found that the compressed air used for driving the machine drills, after having been compressed and expanded, and discharged from the drills, was not wholesome to breathe, and the men and mules would all crowd around the end of the blower pipe to get fresh air suitable to be inhaled by the lungs.

Whether the air in being compressed has parted with some of its oxygen or become vitiated from some other cause, I do not know, and I hope that this subject will at some future day be carefully examined into.

Speaking of mules, reminds me of some of the peculiarities of these intelligent animals, which were extensively utilized in the underground workings. We soon found that horses would not do, for if anything touched a horse's ears, it would throw its head upward, and so be apt to injure itself, while a mule, if anything touched its ears, very wisely dodged.

We had as many as 200 mules employed in the transportation of debris from the works and otherwise. Going along through the tunnel a torch would be fastened in the mule's head, but coming out of the darkness into the sunlight their eyes became dazed, and returning into the darkness from the bright sunlight the mules could not see anything and stumbled about, so a remedy was found, and that was to bandage up one eye before coming to daylight, which bandage was removed after the mule had reentered the tunnel, thus enabling it to see perfectly with that eye.

In driving the tunnel all the length of four miles many obstacles were encountered. As regards the surveys, it was not an easy matter to keep a perfectly straight line, for sometimes observations had to be made at short distances on account of the mist, and the slightest variation in centers would throw it to one side or the other.

After the tunnel, however, was completed and the connection made with the shafts at the Comstock lode, the foul and moist air was driven out within the first 24 hours, and for the first time daylight was seen from its farther end, appearing as a small, tiny star of the fifth magnitude.

If the tunnel had been driven a few miles more daylight would have been lost altogether, though the opening at the mouth was quite large.

In this connection, speaking of surveying, we had another curious experience.

Under the Act of Congress the Sutro Tunnel Company was given a right in all the mines discovered for a width of 2000 feet on each side of the tunnel for its whole length. When the time came to survey this grant, application was made to the General Land Office at Washington for the survey of those 4000 feet. The law provided that 2000 feet should be projected at the tunnel level, but the Land Office at Washington proposed to run the lines on the surface to that width, to which we objected, for a line measured 1500 feet or 2000 feet under ground would have a greater width projected up in the surface, being a portion of the radius of a circle commencing at the center of the earth; it would have given us several feet more on the surface, which might have been of great value in that country of bonanzas.

The Land Office, however, refused to make that projection, and so we had to accept the 4000 feet as measured on the surface.

In driving the tunnel we encountered all sorts of ground, nearly always rock, some as hard as flint, and some of ordinary hardness. In very hard rock, the drills striking against it would illuminate the face of the tunnel with a thousand sparks, and give the men and the machinery quite a ghastly appearance.

At many points great bodies of accumulated and often hot waters were struck, which came out through the crevices with such force as to throw the men down. At still other points great bodies of clay were encountered, especially when approaching the Comstock lode. This clay, after being cut through, would swell, and timbers 16 inches square would break in two like mere reeds. The pressure in some places was so great that a cap 16 inches square, placed on posts of the same dimension, would be found to be pressed through by the posts within 24 hours, showing an almost inconceivable force. In one place the track did swell up every day, and had to be cut down 13 times before it remained level.

The heat in the face, though very high, could be endured on account of the fresh air constantly being blown in, but a few hundred feet back of the face the air would be insufferably hot, and so much deprived of oxygen that a candle could not be kept lighted.

In the dry atmosphere of Nevada, electricity accumulates very rapidly in the human body, and I could, first walking over the carpet, on almost any day, with my fingers light the gas. This was the cause of several accidents. We had a special house for the storage of electric exploders, and two men in charge of this house were terribly injured at different times through touching the wires of these exploders with their naked fingers, which caused several thousands of them to explode together. One man was killed outright, being penetrated with thousands of pieces of the copper which forms the exploder caps, while the other poor man lost his eyesight. This last accident occurred, notwithstanding the precautions which had been taken to make the men, before entering the exploder-house, wet their shoes, while on the floor of the house was placed an iron plate connecting by means of wires with the water flowing below to carry off the electricity.

Then followed a graphic account of the various theories on the origin and formation of the Comstock lode, and the difficulties of mining at great depths, and how they had been overcome.

The lecture concluded with a display of excellent lantern slides illustrating the lecture, which Mr. Sutro had prepared in London and which were thrown on a screen by Prof. Christy.

MINING IN GREAT BRITAIN IN 1891.—

From the report of Her Majesty's Inspector of Mines for the year 1891, which has just been issued, it appears that during the year 1891 the total number of persons employed in and about the mines in the United Kingdom of Great Britain and Ireland, together with the Isle of Man, and inclusive of those employed on private branch railways and tramways, and in washing and coking coal on premises adjacent to or belonging to the mines, amounted to 707,411, of whom 6112 were females above ground. The number of persons employed in and about the mines, exclusive of those employed on private branch railways and tramways, and in washing and coking coal on premises adjacent to and belonging to the mines, was 687,878, of whom 5819 were females working above ground, the aggregate increase being 32,581 compared with the preceding year. The total number of fatal accidents was 961, and the total number of deaths occasioned thereby 1030, being an increase of 62 in the number of fatal accidents, and a decrease of 176 in the number of lives lost, compared with the totals of the preceding year. There was one death for every 668 persons employed, which is more favorable than the ratio, one in 543, of the preceding year. In the mines classed under the Coal Mines Regulation Act, the total quantity wrought in the different districts was 197,693,592 tons, of which 185,479,126 was coal and 29,150 ironstone, the rest being fire-clay, oil shale and other minerals, making a total increase of 3,087,705 tons, compared with the preceding year, there being an increase of 3,864,838 tons of coal, but a decrease of 888,326 tons of ironstone. There has been a continuous increase in the output of coal since 1873, the quantity raised last year exceeding that of 1873 by nearly 57,000,000 tons. The quantity raised has increased since 1887 by 23,361,314 tons.

WARNER & SWASEY of Cleveland, Ohio, have secured the contract for remounting the telescope of the Naval Observatory at Washington, which means that all the present machinery of the telescope is to be discarded and replaced by the latest designs of Warner & Swasey. They are also to put in the elevating floor, dome, etc. This telescope, until recently, was the largest in the country, the glass and its mounting complete being furnished by Alvin Clark & Sons. The glass is entirely satisfactory, as of course all Clark glasses are, and that is to be retained; all else is to be new.

NOT DEAD ON THE DESERT.—A Deputy Customs Inspector from the Mexican line, in the neighborhood of Campo, on the border of the desert, arrived in San Diego on the 15th inst. He reports that the Pegleg searching expedition of Doran and Bell, who were reported a few days ago through a dispatch from Los Angeles as having perished on the desert, were at Campo when

he left on Wednesday alive and well. They will rest there a few days and then continue the search for the lost mine, of which they had so far found no trace.

Duties of Mining Superintendents.

Laws to be Obeyed in California.

Attention is called to a decision of the Supreme Court of California on the duties of Mining Superintendents, as defined by "An Act amendatory of an Act entitled an Act for the better protection of the Stockholders in Corporations formed under the laws of the State of California for the purpose of carrying on and conducting the business of Mining." Approved March 30, 1874. Passed the Assembly March 9, A. D. 1880. Passed the Senate April 16, A. D. 1880. Approved April 23, A. D. 1880.

The People of the State of California, represented in Senate and Assembly, do enact as follows:

Section 1. . . . It shall be the duty of the Superintendent on the first Monday of each month to file with the Secretary an itemized account, verified under oath, showing all receipts and disbursements made by him for the previous month, and for what said disbursements were made. It shall also be the duty of the Superintendent to file with the Secretary a weekly statement, under oath, showing the number of men employed under him, and for what purpose, and the rate of wages paid to each one. He will attach to such account a full and complete report, under oath, of the work done in said mine, the amount of ore extracted, from what part of the mine taken, the amount sent to mill for reduction, its assay value, the amount of bullion received, the amount of bullion shipped to the office of the Company or elsewhere, and the amount, if any, retained by the Superintendent. It shall also be his duty to forward to the office of the Company a full report, under oath, of all discoveries of ores or mineral-bearing quartz made in said mine, whether by boring, drifting, sinking, or otherwise, together with the assay value thereof. All accounts, reports, and correspondence from the Superintendent shall be kept in some conspicuous place in the office of said Company, and shall be open to the inspection of all stockholders.

A RECENT DECISION.

The case of *Manuel Eyre vs. A. K. P. Harmon, et al.*, No. 13,497, in the Supreme Court of California, was decided December 30, 1891. This was an action brought by the plaintiff as a stockholder of the Consolidated Imperial Mining Company, a mining corporation formed under the laws of California, to recover from the defendants, who were directors of said corporation, a penalty of \$1000 for the alleged failure to have made and posted in the months of October and November, 1888, certain accounts provided for by the statute for the better protection of stockholders of Mining Corporations, approved April 23, 1880. Statutes of 1880, page 400.

In reversing the judgment of the Superior Court of San Francisco, Judge De Haven said:

The only reports directed by Section 1 to be made are the weekly reports of the Superintendent, showing the work done in the mine, the amount of ore extracted, from what part of the mine taken, the amount and assay value of the ore sent to mill for reduction, the amount of bullion received and shipped to the office of the Company, or elsewhere, and the amount, if any, retained by the Superintendent; and the other report, in relation to discoveries of ore, to be made on the occasion of such discovery.

The statute proceeds on the theory that the stockholders, whether in the minority or majority, have a right to be informed as to the manner in which the business of the corporation is being conducted, the receipts and disbursements, the number of men employed and the wages paid each, and also the value of the bullion shipped from time to time, and how much ore or bullion remains with the superintendent; and also whether any discoveries of ore have been made in the prosecution of the work, which, if known, would affect the value of the mine in which they own an interest. The means by which the stockholders are to receive this information are provided with great particularity in Section 1. These means are: 1st, full and complete books of account to be kept by the Secretary, and to be open to the inspection of the stockholders; 2d, the monthly balance sheet, or in place thereof an itemized account, to be posted in the office of the Company, and lastly, the reports of the superintendent, which are to be forwarded to the office of the Company, and kept there subject to the inspection of stockholders. Now, undoubtedly, it is the intention of this law that all of these accounts and reports shall be made as directed. There is nothing unreasonable in what is required, and it is the duty of the court, unless there is some fatal omission which defeats its intention, to so construe the statute that it shall have effect. It is urged that the duty of making reports cannot be compelled, because no penalty is imposed upon the superintendent for a failure to make them. This argument, however, does not meet the real question involved here, which is only, whether the Act

has made the directors of the corporation liable for their failure to have these reports made.

THE DIRECTORS ARE THE GOVERNING BODY

Of the corporation, and as such have the power to employ the superintendent, to prescribe his duties, and to dismiss him if he fails to discharge such duties. They have the right to direct the superintendent to make these reports, and if such direction were given in good faith, it would doubtless be obeyed, as it would be unreasonable to suppose that officer would refuse to obey when such action might insure his dismissal from their service. Now, it was in view of these obvious considerations, which must have been in the minds of the legislators as men of ordinary experience, that the act in its penal clause addresses itself to the governing and controlling body of the corporation, and makes the directors liable for a failure to have made the reports referred to in section one. This does not, as respondent contends, make the directors liable for the mere neglect of the superintendent, without any fault on their part. The statute is both remedial and penal in its nature. Its general purpose is to secure to stockholders their right to have general information of the manner in which the business of the corporation is being conducted, and in order to enforce this right they are permitted to institute actions for liquidated damages for a failure on the part of the directors to give them the information referred to in the statute; and in order to justify a recovery, it must appear that there has been an intentional disregard of the law—a willful neglect to comply with its requirements. Under this construction, directors are only liable for a willful and intentional failure to have the superintendent perform his duty. Impossibilities are not required of them, but only that they shall in good faith direct this officer, who is at all times subject to their control, to obey the positive requirements of the law in the matter of these reports.

The fact that the mine is being operated in a distant State or Territory does not place it beyond the power of the superintendent to make these reports. They are not required to be on file on the first Monday of the month, or at any other particular date; they are to be made and forwarded weekly, and if so made will be received weekly, and that is all that is required, and this is easy of accomplishment. The reports in regard to discoveries of ore are only to be made upon the occasion thereof.

As thus construed this statute imposes NO UNREASONABLE BURDEN UPON DIRECTORS.

Of this class of corporations. It requires only good faith and common honesty in their management of property intrusted to them, and enforces from them a proper regard for the rights of those for whom they are trustees, so far at least as giving information of the working and development of the mine, and of all receipts and expenditures and discoveries attending the same. It is true that this class of statutes in their penal clauses ought to be strictly construed; but this rule does not mean that when the intent and object of the law is plain, such object may be defeated by an over-nice construction. In the language of the Supreme Court of the United States, in *U. S. vs. Hartwell*, 6 Wall. 396: "The rule does not exclude the application of common sense to the terms made use of in the act in order to avoid an absurdity, which the legislature ought not to be presumed to have intended." To hold that the word "reports" as found in the penal clause of this act is meaningless, is not only to refuse to give effect to a word which, in the connection used, obviously and naturally refers to the reports of the superintendent, which by section one are required to be made, but such construction defeats the general purpose of the statute itself. But it is a general rule, applicable to the construction of penal as well as other statutes, that no word is to be eliminated from a section by the Court if a sensible meaning can be given to it, unless by giving such word its meaning the real object of the statute would be defeated. With much greater reason is the Court required to give effect to each word in a sentence, when not to do so is to deprive the law of the vitality necessary to secure respect for its commands. Applying this rule, there is no difficulty in the construction of section three of this act. It simply makes the directors liable to the penalty named for a willful failure to have such reports made and accounts posted as are referred to in section one. If the directors cause the reports of the superintendent to be made, and the monthly accounts to be posted as required by the statute, the law is complied with; otherwise not, and they incur the statutory penalty if the failure to do so was intentional on their part.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

SUTTER CREEK.—Cor. Amador Ledger, April 16: The heavy storms being apparently over, the taking out of the water in the Hector mine was recommenced this week, and it is to be prosecuted vigorously at the rate of 3330 gallons per hour. At this rate the mine will be clear down to the 200-foot level in about two weeks. Mr. Valentine says a temporary belt will then be made for the purpose of cleaning out the tunnel, and putting men to work on what ore they can find. Thomas Valentine has been up with a party of surveyors, looking up boundaries, etc., and no doubt they mean business.

AMADOR CITY.—We are glad to report that the Gover mine is looking well. They are taking out some fine looking rock from the 700-foot level. It is the intention of the South Spring Hill Company to sink a new shaft south of the present one. For this purpose the surveyor has been on the ground this week surveying.

AMADOR QUEEN.—Ledger, April 16: The pocket of metal struck in Amador Queen No. 2 has been extracted. It amounts to about 70 tons. An assay has been made, which gave \$100 per ton. At this rate it ought to yield a very handsome profit over all expenses.

KIMBALL.—A. W. Kimball is busy prosecuting work on his mining claim in Pioneer district. He is down 150 feet, and the ledge has widened out to three feet. He has a large quantity of rock on the dump, but none has been crushed as yet. Estimates place it at a very high grade. His claim gives the denial to the generally accepted theory that quartz veins in that region pinch out at a trifling depth. One hundred and fifty feet is deep sinking for that district, and the fact that the ore-body is widening instead of narrowing at this depth is calculated to give renewed confidence in mining in the upper section of the county. The fact is, the mines have never been prospected to any depth. The rich veins have been worked until they pinched, and that has been deemed conclusive of the complete exhaustion of the mineral treasure. The same apparent pining out of the vein has been met with time and again on the mother lode, but, after passing through the barren ground, the ledge has reappeared. It is not improbable that the same may be the case in the eastern districts of Amador county.

MISCELLANEOUS.—The sinking operations at South Eureka have reached over 500 feet. They are now employed in making the sump, about one-half of which has already been sunk. When this is finished, which will take probably a couple of weeks, drifting for the ledge will be commenced. Everything looks favorable, and those interested have a growing confidence that it will develop into a paying property. F. Mace says that the asbestos ledge mentioned in last issue is located on the banks of Sutter creek, about four miles from town. He has not sunk on it at all, but followed it five or six feet into the bank, and that it is fully six feet wide. Such an enormous body of this mineral is worth looking after. It is in contact with a vein of serpentine. The ledge is solid and compact, apparently unmixed with any deleterious substances.

El Dorado.

RICH ROCK.—El Dorado Republican, April 11: At the Genie Annie mine the owners have discovered a body of very rich ribbon rock, which has been uncovered in the tunnel for a distance of 150 feet in length. In the bottom of the tunnel the ledge is from 12 to 15 inches wide, and a few feet above the tunnel it closes out. A shaft has been started and as it goes down, the ledge is found to retain its richness and is rapidly widening. It is believed that a valuable body of ore will be developed.

Humboldt.

COAL.—Cor. Watchman, April 16: The recent discovery of oil in the southern portion of the county recalls to my mind several instances of the discovery of coal deposits in this county. In 1861 I discovered a vein of coal within three miles of Hydesville. I dug up and packed from that vein five horse loads, all of which, with the exception of 60 pounds taken to Eureka, was used in the blacksmith forge at Hydesville. The coal burned with a large blaze like hickory, leaving a great deal of ashes. The casing of the coal in the mine was hard sandstone. The vein was about a foot thick at the surface, but grew more narrow as I descended. Within about a hundred yards I found a spring with gas coming up out of it, which burned when I touched a match to it. At the time located and marked some trees there, and I can now direct any one to the place. There is another vein about 12 miles from Hydesville. About a mile from the last mentioned mine there is a vein three or four feet thick, and I near that still another vein nearly a foot thick.

Inyo.

TIN AND GOLD MINES.—Cor. Reno Journal, April 16: Deep Springs mining district, 20 miles northerly from Big Pine, has a veritable boom coming to the front with the first showing of a splendid tin deposit. W. H. Ihlmeyer and Antone Cunah have three locations, and show a communication from the Mining Bureau of California informing them that they have what has been found only in two localities hitherto, to wit, domestic tin. Samples will be sent to the University of Nevada for analysis. M. H. Bush has struck a fine five-foot ledge in his claim lying a mile and a half from Alford Station and three and a half miles from Big Pine. This lead is well

defined, and the rock works \$28 per ton in gold, consequently its owner is not handicapped by the coinage racket. The Fish Springs camp, eight miles south of here, is turning out a steady output.

Mono.

BONIE CONS.—Miner, April 15: During the past week east crosscut No. 1, 700 foot level, was extended eight feet. We are stopping out some \$30 ore from above south drift, 500 foot Jupiter shaft level.

THE MONO.—North drift No. 2, 600 foot level, was extended 14 feet. There is a formation of 12 inches of quartz and clay. The ore stops above 700 continue about the same as last report. In the ore stop below south drift, 700, the ore will average from 6 to 11 inches, and is very rich. The mill was kept running steadily.

PINE NUT.—Bodie Miner, April 15: George H. Bump returned this week from a trip to Pine Nut mining district, in which he and Andrew Smith are interested. Mr. Bump spoke very highly of the outlook of the district, and said that considerable good ore is being extracted. The mine that he is interested in is about three miles east of the Mountain House. The ledge, which is a short distance below the surface, is about eight feet wide, running north and south and pitching to the east, with porphyry formation. The owners are so well satisfied with the prospect that they will, in a few days, commence a tunnel that will tap the ledge at a depth of 400 feet.

Nevada.

NEW YORK CONSOLIDATED.—Grass Valley Union, April 16: The New York Consolidated is the name of a quartz location of 1500 feet on Kate Hayes hill, of which James Burke is the principal owner and has been running a tunnel for some months. The ledge has recently been struck where the vein shows a width of two feet, and presents a favorable appearance. The vein is now to be drifted upon. The tunnel is at a lower point than has ever been reached on the ledge, and will serve the purpose of surface drainage, and for prospecting purposes.

CENTENNIAL.—Virginia Enterprise, April 17: A letter from Superintendent Richards to the secretary, W. S. James, Gold Hill, gives the following information to the owners of the Centennial, nearly all of whom are Comstockers, although the mine is situated in Nevada county, California: "I started one man to work down from the surface a few days ago, and we made connection, completing the upraise, to-day. It is 310 feet from the top of the main tunnel to the surface. The opening is 25 feet higher than the bed of Deer creek, and we have a splendid draught of air throughout both the tunnel and the incline, giving the best of facilities for future work. The main tunnel is in 140 feet beyond the foot of the upraise, making a little over 2200 feet from the mouth of the tunnel to the face. I propose to keep all the men working in the face for the remainder of the month, unless otherwise directed." The upraise mentioned was started last fall for air and water purposes, and the survey turns out to be correct. All the water required for gravel-washing purposes can now be easily sent down the incline from Deer creek, and it will not be long before the ledge and valuable gravel bed already developed will be made financially available. The latest gravel strike, at the face of the tunnel, prospects good pay. It is of a fair washing character, and contains more and coarser round wash boulders than heretofore met with, indicating the approach to or presence of the long anticipated back channel.

JACK RABBIT MINE.—Telegraph, April 15: Captain James Hamill, the foreman of the Jack Rabbit mine, informs us that they have a large ledge in the bottom of the shaft and it is "lively" quartz. The shaft is driven 250 feet and is in good ground and is still going down. An 8-inch pump is being put in place at the Jack Rabbit and will soon be in operation.

ORLEANS MINE.—A crushing of 15 loads of ore from the Orleans mine has just been completed at the Rodgers mill and it paid about \$40 per load. The ore came from a point near the Empire line. Work is going steadily on at the mine and everything indicates that a valuable property will soon be developed.

AN IMPORTANT SALE.—Nevada Transcript, April 9: What may prove an important transfer was recently made in this city, when the Yellow Diamond claim, about 3½ miles west of town, changed hands. This property, which has for many years been in the possession of A. J. Ragon; Mrs. A. Jamieson, Ralph Locklin and Mr. and Mrs. Benj. Locklin, has been sold to G. B. Chittenden, S. B. Ladd, A. F. Dunnington and others of Washington, D. C. The Yellow Diamond has been thoroughly prospected, and is known to be a good ledge. Assays of the ore range from \$37 to \$266, and where last worked the ledge was six inches thick. The company have in all 4200 linear feet on the lode, with its two extensions. The promoters of the enterprise are forming a stock company at Washington and will organize with 100,000 shares at a par value of \$10 each, with a working fund of 50,000 shares.

TRIBUTE QUARTZ.—Ambrose Powning and Thomas Duncan are taking out quartz on tribute from the Orleans ledge, and crushings have run from \$34 to \$42 per ton.

WASHINGTON.—Cor. Transcript, April 13: Fritz Meister and company, on Canyon creek, are doing nothing on their property to speak of. They are waiting till the roads are in condition so they can get lumber in from the saw mills, when a new mill will be built and other improvements made on their property. Donabne and Stewart, owners of the Maryland ledge, Micawber like, are waiting for something to turn up. At the German mine there is nothing new to report, except that a 3-foot ledge has been struck in the lower tunnel which shows freely in galena, sulphurets and a fine sprinkling of free gold. The main tunnel is now in about 500 feet, which will give backs of nearly

or quite 250 feet. A. E. Baugh and Supt. Calahan of the Eagle Bird mine have quite recently bonded the Blue Jay quartz mine for one year from the present owners. It is their intention to develop the property for the purpose of making a sale to other parties.

Placer.

DRIFTING.—Placer Argus, April 16: We learn from T. B. Everett, secretary of the Placer County Miners' Association, that the Harlon drift mine, three miles south of Loomis, is employing about 30 men. They are working two shifts, and running their mill constantly, with an average crushing of 45 tons per day. Their clean-ups average \$2400 per week, of which 60 per cent is clear profit. The gravel is taken entirely from drifts and laterals for development of mine, no breasting being done. This mine is the property of W. P. Harlon. Jas. Laird is superintendent.

San Bernardino.

THE NEW PROCESS.—Cor. Cal. Farmer, Miner and Oil Reporter, April 16: The trouble with miners here is the absence of reduction works. This difficulty is likely to be removed. The smelters put up at the Needles will be of great benefit in this direction; but we are to have another nearer home. The Silver Mountain district, San Bernardino county, has again the appearance of renewed life and vigor. A small syndicate of Los Angeles gentlemen, composed of M. M. Morrison and A. C. Banson, formerly real estate brokers at 139 S. Broadway, and E. L. Doherty, Mr. Canfield and Mr. Renchler, who have been long known in the various mining camps of the southwest, have recently stepped to the front, backed by the new MacArthur-Forest process for the extraction of gold and silver. The gentlemen named above have purchased the right to use it at their mills on the Southern California railroad, about three and one-half miles northeast of Oro Grande. This plant is now being remodeled and refitted with a view of treating the ore of their own mines and doing general milling. It is claimed that this process will solve the problem of successfully treating the low grade ore of this part of the State (or at least the most of it). There is some ore here that even this simple process cannot handle. Experimental work has already commenced at the plant, but they do not expect to be in good running order until after the first of May; after which time, the capacity of the plant will be increased according as the demands warrant.

Shasta.

READY.—Shasta County Democrat, April 15: Everything is in readiness at the South Fork reduction works for the machinery which, up to last Monday, had not arrived at Anderson. The roasting furnace is completed and under cover. Two miners named Booth and Gillen, the former lately from Idaho and the latter from French Gulch, have taken a lease on the South Chicago mine in South Fork mining district, and Monday shipped out a camp outfit. By the time the reduction plant on South Fork gets in running order, they expect to have out considerable high-grade ore. Major Lyons, who has owned and been developing the old Martin mine near Churntown, for some months past, is greatly pleased over the showing his mine is making. He claims an ore chute 2000 feet in length, and where development work has been done it shows up more than average milling ore. He expects to thoroughly prove and develop the property by running a tunnel into the mountain from the Sacramento river side and mill the ore from the mine on the river. Mr. H. L. Coleman, representing the Edison Electric Supply Company, was last week, visiting the Cline Gulch and Squaw Creek mines. He visited the Uncle Sam mine last Sunday in company with Fred Grotefeld. From Mr. Grotefeld we learn that the Gladstone Mining Co. has contracted with Mr. Coleman for an electric power plant, which the company will put up on Clear creek, where water power can be had, and with this power run all the machinery at the Gladstone mine, several miles away. The machinery for the electric plant will be supplied from the manufactory in the East. We also learn that the Uncle Sam Mining Co. contemplates putting in the same kind of power.

WHITE OAK.—Shasta Courier, April 16: We understand that Mr. White of Lower Springs was offered a good round sum in hard cash for his White Oak mine, but refused to sell for less than \$10,000. Jim Sutherland and the Early boys are keeping their team arastre steadily running on good rock from their mine on north fork of Middle creek, a half mile west of town. It is reported that negotiations are going on for the sale of the Tiffin, Penrose and other mines in Lower Springs district. The Schroter Bros.' cannon ball mill on Rock creek, near town, is running steadily, pulverizing rock from the Ed Reese mine. If no heavy storms or unfavorable circumstances intervene, the Iron Mountain silver mine will be running before the middle of May. The management of the mine has added many improvements to the already extensive plant, and a force has been busy since last winter completely overhauling the works and putting in more machinery, and when the stamps are again in motion the bullion-producing capacity of the mine will be almost doubly increased. One of the proposed improvements is an electric light plant. The "J. Y. Smith" mine, on the Middle Creek road, which is owned by Parker of Sacramento, has been attached by Joe Penrose. Some time ago, Parker bonded a mine of Penrose for \$10,000, agreed to do a certain amount of work on it, and also bonded other mines in this locality. The money was not paid, nor improvements made, hence the attachment. The Smith mine may be sold to a Shasta party, and the matter will then no doubt be adjusted to the satisfaction of all. Jos. Bell has put a force of men to work on the Sunny Hill mine.

MINING FOR PROFIT.—Redding Free Press,

April 16: Some months ago E. P. Connor bonded the Crossbow and Sky Blue mines to Arnold Becker for \$5000, part of the money paid down. This week the balance was paid. Mr. Becker has organized a strong company, which is developing the property. After the bond had been given, Mr. Connor made a prospecting trip above the Tower House, and after camping out for three months and crawling through the brush, discovered a ledge on which he sunk an incline, laying bare for 25 feet ore that assayed \$25 to the ton. He then started a tunnel, which is at present 104 feet long, and he expects to strike the ledge in a few days, when he will have a thousand feet of ore backing. This shows what a poor man can do by judiciously disposing of property which he cannot handle and investing the money elsewhere. Had Mr. Connor bungled on to the Sky Blue and Crossbow claims, without the money necessary, he would to-day have nothing wherewith to buy grub. Now he has money and as good a mine as he sold. The Calumet Company start up their mines the coming week, they being now only 200 tons ahead of their milling work. Ore is now being hauled from the Ohio group of mines, on Flat Creek, to the Shasta mill for working by the MacArthur-Forest process.

Siskiyou.

QUARTZ VALLEY.—Cor. Yreka Journal, April 13: Owing to the recent rains the miners in this section are having plenty of water, and the general expression is, Are you working on the day or night shift. The Allen Bros. have commenced crushing and expect to run through about 400 tons, having already 300 tons on their dumps and in the mill. This will be the largest crushing ever made in this vicinity. R. H. Campbell is working a large crew of men in his hydraulic mines, and is running continuously. I understand the English syndicate with whom he has been negotiating, intends expending \$20,000 toward prospecting the main channel, running down the east side of the valley, and that Mr. Campbell has gone to San Francisco to procure the necessary machinery for sinking. This will be looked forward to with interest, as it is the general belief that the east side of Quartz valley is very rich. The Stockton Gravel Mining Co. is still taking out money by the hatfuls. Their gravel has been paying for the last three weeks from \$40 to \$60 to the set of timbers and bears every indication of being a permanent thing. This is one of the richest strikes made in this section of the country for a number of years. This company has 80 acres of patented ground, besides several minor locations. Their gold is fine in quality and coarse in character, more than half being found in nuggets weighing from \$5 to \$50. It is supposed to have come from an old river channel, underlying the mountain a short distance to the south. This channel is plainly traceable, and in all probability very rich. A great many thousand dollars were expended in early days in efforts to reach the bottom, but all labor in that direction was eventually abandoned. The Howard Bros. of this valley are now running a tunnel which they think will cut through the rim in 1000 feet. They have over 600 feet completed. The companies engaged on Shackleford creek are making preparations to open extensive mines. Don't know just what they are doing. However, the daily explosions of giant powder cartridges in that direction, puts one in mind of a China new year. Burk and Lewis have struck a very rich bunch of ore in the Pinkham ledge. The quartz fairly hangs together with gold. Dave Starr has also very rich quartz in his ledge at the head of Hull's gulch. He is making big money with a hand maul.

MINING NOTES.—A couple of strangers discovered a rich ledge of quartz on old Craggy, at Humburg creek, last week, and are now getting out a supply for crushing at Hunt's quartz mill. Van Nader, who found a wide ledge on Humburg creek a few weeks ago, has had a quantity crushed at Hunt's mill, which pays exceedingly well. Henry Marion is busily engaged in driving a tunnel in the old Louis Fahl quartz ledge which he purchased lately, and will soon be able to get out a large quantity of good-paying ore. Judge Spencer's quartz mine on Humburg continues to keep the McCook mill constantly busy, with the quartz yielding handsome returns. The Allen Bros. at Quartz valley are taking out very rich quartz from their ledge at present, and having put in hoisting works and other machinery, will do better this season than ever before.

WING DAM.—Yreka Journal, April 20: One of the most extensive wing dams in the county is now being built by a Chinese company at Klamath river, about 2½ miles above Oak Bar. It is over 200 yards long, and built at Dorgett's ferry, a large number of hands being employed. The river has been paying very rich during former years at that point, and a big haul of gold is expected this year from the extraordinary efforts put forth toward scooping up the bedrock deposits in the old river channel of prehistoric times.

THE BALLARAT COMPANY, sinking down to bedrock under the cement bottom of the old Chinese hydraulic claim at Spring gulch, just north of town, started their steam engine again last Wednesday.

NEVADA.

Washoe District.

CON. CAL. & VA.—Chronicle, April 16: 1650 level—Have been repairing the upraise carried up 50 feet above the southwest drift. Ore of fair quality has been extracted from the drift run east from the winze No. 3 (down 73 feet) in working upward from that point. From the north end of the California ground on the west side are working in the old stopes and extracting therefrom some ore of fair quality.

1750 level—In east crosscuts Nos. 1 and 3 from the main south drift have continued to extract some milling ore.

1800 level—Along the south end of the drift

running south from the crosscut run east from the winze No. 1 sunk from the 1750 level, we have continued to extract ore from the sill floor upward of milling value. The east crosscut from the bottom of the winze No. 1, sunk 22 feet below the 1800 level, has been extended 11 feet; total, 31 feet; continuing in a quartz formation, showing some ore of milling value. There has been extracted from all parts of the mine during the week 1110 1760-2000 tons of ore, which were shipped to the Eureka mill. The average assay value of the ore worked at the Eureka mill during the week, 1045 tons, was \$19.85.

ORINE.—1465 level.—From the mouth of the north drift, from the drift run west from the winze 122 feet below the sill floor of the 1300 level, have continued our work in an easterly direction and extracted some ore therefrom. There has been raised to the surface during the week 2½ tons of ore, the assay value of which is \$19.37 per ton.

MEXICAN.—On the 1465 level the south drift from the crosscut running east from the bottom of the winze, 32 feet east from the winze, has been advanced 20 feet; total, 74 feet, continuing in porphyry and clay with quartz of low assay value.

UTAH.—The west drift from the shaft station, 340 level, has been extended a total length of 510 feet; drift continues in porphyry formation, showing clay separations and a little water.

SIERRA NEVADA.—The joint Sierra Nevada and Union west drift, 900 level, was extended during the week 23 feet, making its total distance west of shaft 1843 feet; face in porphyry. The north drift from the Kenosha tunnel was advanced 41 feet; total distance, 907 feet; face in porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union west drift from the shaft, 900 level, has been extended during the week 23 feet, making its total distance west of shaft 1843 feet; face in porphyry. The east crosscut near south line from south lateral drift, 1570 feet west of shaft, 900 level, has been extended during the week 20 feet, making its total length 40 feet; face in porphyry with seams of clay.

BEST & BEICNER.—900 level.—West crosscut No. 1 has been advanced 22 feet, through porphyry and stringers of quartz; total length, 177 feet. Still on repairs in east crosscut No. 1.

GOULD & CURRY.—200 level.—Northwest drift, 435 feet west of shaft, has been advanced 20 feet through soft porphyry; total length, 196 feet above 200 level. East crosscut No. 4 from south drift has been advanced 12 feet; total length, 22 feet; face in soft porphyry.

HALE & NORCROSS.—On the 900 level, east crosscut above this level advanced during the week 25 feet; total length, 70 feet. After cutting the east clay, stopped work in the face of this crosscut. About 45 feet back from face, have started an upraise in the ledge. Top of this upraise is all in quartz yielding low assays. Winze near north line on t is level sunk 10 feet; total depth, 35 feet; bottom in quartz, but of no value. 1100 level.—The stopes above and below this level continue to yield the usual quantities of ore. Extracted from this level during this week 343 tons of ore. 1450 level.—Stopes yielding about as usual. Extracted from this stopes during the week 116 cars of ore. 1500 level.—Stopped work in stopes south from bottom No. 1 winze. Have men on repairs where needed in the mine. During the week have hoisted 459 cars of ore and shipped to the Brunswick mill 436 440-2000 tons. Average battery assay of ore worked at Brunswick mill for the week, \$16.24. Shipped to Occidental mill about 110 tons of ore for a trial run.

CHOLLAR.—Are making repairs on the 450, 650 and 750 levels. The east crosscut on 1610 level, 150 feet south of north line, is out 60 feet; face in porphyry.

POTOSI.—The raise above the 1100 level is up 135 feet on the stopes; top in porphyry. The winze is now down 200 feet below the 1500 level; bottom in porphyry and quartz. The joint Potosi and Bullion west crosscut on north line, 1500 level, is out 123 feet; face in hard porphyry. Extracted and sent to mill during the week 340 tons of ore; milled during the week 351 tons; on hand at mill, 140 tons; average battery assay, \$27.50.

BULLION.—The east crosscut, 350 feet south of north line, 1300 level, is out 69 feet; last 23 feet in quartz and porphyry give low assays. The joint Potosi and Bullion west crosscut on north line, 1500 level, is out 123 feet; face in hard porphyry. The south drift, 1500 level, is out 377 feet south of north line; face in porphyry. Have been repairing southwest drift from Ward shaft, 1800 level, during the week.

WARD COMBINATION SHAFT.—Have been re-timbering the southwest drift, 1800 level, during the week.

EXCHEQUER.—There has been no work done on the 660 level during the week. Are re-timbering the joint shaft.

OCCIDENTAL.—The west crosscut from the south drift, 400 level, has a total length of 65 feet. Have started a north drift from bottom of winze, 400 level.

Ferguson District.

GORN.—Pioche Record, April 14: The feverish excitement here, following the reports of the gold discoveries made within the last ten days at Ferguson, or Monkey Wrench district, as it is generally called, has by no means died out, but with a great number continues to increase and the district is overrun with prospectors and others, principally from Pioche, all hopeful of making a stake in the new burg. The Magnolia claim, owned by the Ferguson boys, Jerry Manning and H. A. Cohn, is the first and chief mine of the district. The ledge is four feet in width, of porphyry and quartz, and carries both gold and silver, the average of the ledge in gold being reported at from \$500 to \$600 per ton. The working shaft on this claim is ten feet in depth, and the ledge at the bottom is as well defined and as rich as at the top. The

prospecting which immediately resulted from the discovery of this claim tended southerly from it, and a half dozen or more prominent quartz ledges, which before were regarded as barren, are found to be seamed with rich streaks of gold and silver-bearing ore. At a point three miles south from the Magnolia, gold quartz equal almost in value to that of the Magnolia has been located, and the country between the two points is covered with claims said to overlap each other in every conceivable shape. The biggest thing outside of the Magnolia is a reef or ledge of quartz located by Reeves, Ellis and Wilson about the first of this month. The ledge is said by one who views it to stand from 10 to 20 feet above ground, to be from 20 to 50 feet wide and over 500 feet long on the surface, and as straight almost as a line can be drawn. The ledge contains copper-stained horn silver and free gold, and the latter in sufficient quantities to show plainly in horning. Eight or more locations are placed on this reef, and the owners hold it as fabulously rich, though practically no work is yet done on it. Reports of other good finds in other parts of the district are confirmed, and, if no more are found, those already existing are of such magnitude as to justify the belief that a prosperous town or two will soon exist there. But a few days, so to speak, have elapsed since the excitement begun, and all have been scouring the country for new finds. This is beginning to end, and we will soon know definitely the average values of the ore there. Joe Goodrich has taken down an assaying outfit and should be at work by this time. Alfred Godbe proposes to open a general assay office there at once also. J. J. Manning, W. C. Glissan, James Pierson, Geo. Neshitt and the Ferguson boys have located a townsite and named it Golden City. So far, a dozen or more tents dot the streets and avenues in which the new metropolis is subdivided. This location is in the vicinity of the Monkey Wrench and Magnolia mines, but the discoveries south of these points indicate that other towns will be started below. The water question is one of great importance. The only water there, comes from several small springs, the nearest of which is three miles from Golden City. Several springs lie to the south, with several claimants to each spring, and the lawyers are likely to come in for a share of the spoils. Among those who have gone from here are Manager Eames and Supt. James of the Pioche Con. Co., who, after looking around, expressed their belief that the country was all right as a mineral section, and immediately arranged for several men to go to work on claims in which they proceeded to acquire an interest.

Kennedy District.

PROSPECTS.—Walker Lake Bulletin, April 15: W. J. Wilkinson, a miner well known hereabouts, writes from Kennedy district, Humboldt county, Nevada, to the effect that it is sure to be a good camp in the near future. He says it is not a good place for "broke" men to go to. The claims now being worked are owned by poor men who cannot afford to pay wages. It is all they can do to get supplies for themselves. It is reported that J. L. Blossom of Battle Mountain will put up a mill soon, and in that event there will be considerable work done, as the ore is plentiful and of good grade, and wood and water are convenient. Mr. Wilkinson's letter continues: This district is named after Charles Kennedy, formerly of Hawthorne. He owns one mine—the Imperial—on which we have run a tunnel 80 feet on the ledge, which averages from 18 inches to 2 feet in width, and goes \$50 in gold and \$50 in lead and silver. Another tunnel is run 170 feet, which will tap the ledge 200 feet under ground. If this tunnel gets the ledge, we will have a big thing sure, as the ledge improves in size and richness as we go down. There are some good placer diggings here. A Chinaman is here who wants to buy or lease all he can get. He has a force of 150 working at Rock Canyon (20 miles south of here) and he thinks these placers are as good as those of Rock Canyon. It is a promising camp, but there is no use of miners coming here to work for wages. When capital comes in it will be better.

Pioche District.

YUBA MINE.—Record, April 14: The new vein of ore opened in the Yuba some weeks ago, of which we made mention at the time, is found to be of considerable extent and of excellent grade. The vein is now opened on the seventh and ninth levels, at which point the work of development goes steadily ahead, four to five tons of ore being daily extracted, at an estimated net profit of \$500. No stopings or winzes are made. The ore comes out in the regular course of development. The Yuba contains a very large quantity of ore, which will undoubtedly be shipped when the railroad shall be built, and the mine is well able to stand its quota of the 150 tons a day, which it is said the Pioche Con. Co. guarantees to ship when the road is completed.

Tuscarora District.

NAVJO.—Times-Review, April 15: North drift, 350 foot level, has been started up; progress, 4 feet. The pump is working well, hauling the increasing flow of water.

BELLE ISLE.—North drift, 350 foot level, extended 6 feet; vein looking well, ore high grade. West crosscut, same level, extended 22 feet. Rock not so hard.

NORTH BELLE ISLE.—West crosscut, 400 foot level, extended 7 feet. West intermediate above the 500 foot level extended 4 feet, cutting a small vein of rich ore. No. 1 upraise, south 500 foot level, extended 25 feet; ore improving. Hoisted 44 cars of second-class ore.

NEVADA QUEEN.—Second level.—No. 1 south drift extended 23 feet and No. 3 east crosscut 24 feet; will connect the two in about two weeks. Cannot work to advantage in raises 1, 2 and 3 until the connection is made, as the ventilation is so bad. The drifts from the top of raises

were run from each about 10 feet, exposing high grade ore and looking well. In No. 3 east crosscut, passed through four feet of ore, 18 inches average assay \$336 per ton; balance average \$45 per ton. Third level.—East intermediate from top of No. 3 raise shows two feet of ore, eight inches, \$275 per ton, and 16 inches \$40 per ton. Stopes from Nos. 1 and 2 chutes continue about the same. Hoisted during the week two tons, average assay \$296 per ton, and 88 cars, \$41 assay.

ARIZONA.

DARK HORSE.—Prescott Courier, April 15: Sam Powell came in yesterday from the Dark Horse mine, owned by himself and partners, which is near the Hassayampa, in Black Rock district. This mine is a recent discovery and is being developed by two open cuts, which expose a streak varying in width from 2 to 12 feet, the ore running from \$6000 to \$7000 silver per ton. Sam had some of the ore in his pockets, which is almost pure silver. He says that Judge Wade, Bob Groom and George Munroe have a fine free-milling gold property in their King Solomon's group of mines; that their 5-stamp mill is running day and night, and there is enough ore in the mine to keep it running for years.

BIG BUG.—S. Morrison was in town yesterday from his mine in Big Bug district, an extension of the Little Jessie mine. He has several men at work sinking on a good ore chimney and will shortly make a shipment. Says the district is a very lively one. New claims are being found most every week. One hundred and seven pounds of bullion were brought in from the Hillside mine. The bullion is valued at \$10 per ounce. Two additional Free vanners will soon be added to the mill. J. O. Floyd was in from Turkey creek yesterday. He has quite a promising silver prospect on Big Bug mesa; the vein runs from one to six feet in width and assays \$400 per ton. His claim is known as the Slocum. John S. Jones came in from his mill and mining properties, Chapparal Gulch, Big Bug district, yesterday. Says the camp is a very prosperous one, indeed. That a goodly number of miners are taking ore from surrounding claims and having it run through his quartz mill, with a fair margin of profit for all concerned. Water is receding a little and he hopes for another storm.

NEW MEXICO.

PAYINO.—Southwest Sentinel, April 22: Dr. Miller's Gladys mine, on the west side of Cook's Peak district, is being operated by Martin Bros. of Deming, who are taking out and sacking about a carload of ore per week. They are paying a royalty of 25 per cent. The mine cleared \$12,000 last year, and there has never been more than five men at work on the property at the same time.

THE BOOM.—The mining boom, which was predicted some time ago, seems to have but just commenced. Although there have been some large mining sales made this year, it begins to look as though there were more important ones to follow. As soon as capitalists find out that this is the richest mineral section in the world, there will be no trouble in getting capital interested in the mines here. More work and less street corner talk will bring capital into this part of the country.

A RAILROAD.—A railroad is to be built from Florida Station, on the Atchison, Topeka and Santa Fe, to the Cook's Peak district. This road has been talked about for some time, as the output of the mines at Cook's Peak has been steadily increasing. There are large deposits of iron ore in the district, and it is believed that one of the objects in building the road is to reach these iron mines in the hope of being able to compete with the company which recently purchased nearly all of the iron mines in the Hanover district. Arrangements have been almost perfected for the erection of sampling works at Deming. A committee has been appointed to secure ten acres of ground on which to erect the works. The Minbras Consolidated Co.'s mill will be started up this week if some machinery which has been ordered from Chicago arrives in time. It is expected that it will be kept running five or six months. Work on the Cochis mill will be continued steadily until it is completed, and it is expected that it will be running on ore from the Mina Grande mine in the Pinos Altos district some time during the summer. The Surprise mine is producing ore which runs from 4 to 7 ounces in silver and averages about 40 per cent lead. Over 50 carloads of ore have been taken out of one pocket in this mine and shipped this year. Fifty tons of ore are being milled daily in the Last Chance mill in the Mogollons, and an average of \$8.50 per ton is saved. This gives a net profit of about \$3.50 per ton on all ore milled. Some ore was taken out of the mine recently which yielded \$20 per ton. The strike in the Jim Crow mine gives every indication of permanence. At a depth of 80 feet there is from 6 to 18 inches of ore, which will net at least \$1000 per ton. A shipment of this rich ore will be made this week, which is expected to return from \$4000 to \$5000 net.

OREGON.

AN ASHLAND COAL MINE.—Ashland Tidings, April 15: Nothing is too high for Ashland's prospects now. Besides having the most promising gold mine in Southern Oregon, she has just uncovered some of the finest coal ever taken from the ground on the Pacific Coast. The find is on the slope just across Bear creek from the town—less than a mile from the city limits. The croppings were discovered by Nohhy Martin and Frank Robinson in a gulch where the coal measure had been cut by erosion. The coal was tested and found to burn well. An expert miner examined the find last

week and pronounced the prospects very flattering. The land on which it is found belongs to O. Coolidge and R. K. Sutton. It was bought in a school section by them several years ago as pasture land. E. K. Brightman, Nohhy Martin and Frank Hansen have bonded the land for a year, putting up a \$100 bonus last Tuesday, and have begun surface prospect work. They find a layer of about 18 inches of coal and slaty matter, but have not yet opened it sufficiently to know much about the extent or situation of the vein below the surface. Beyond question the quality of the coal is first-class. Coal croppings have been found along the Emigrant creek cut in the hills southeast of Ashland, and if one mine is opened, others will no doubt follow.

NEW MILLS.—Bedrock Democrat, April 13: The arrival here of carloads of mill machinery from the East and West is certainly an encouraging prospect of the development of the mineral resources of this section. There arrived at the depot yesterday by the Union Pacific three large mill plants, and the machinery is now being unloaded from the cars. The three mill plants are to be erected on as many different mines. One of the plants, a 10-stamp mill, is from the Chicago Iron Works, and is to be placed on the group of mines owned by the Indiana Co., of which Mr. J. E. Meacham of this city is manager and superintendent. The machinery will be sent by wagons to the mines at once. Another of the plants arriving is a 10-stamp mill for the Virtue Mining, Milling and Development Co., and is to be placed on the old Virtue mine. A. V. Oliver, manager, located just 8 miles east of Baker City, and from which large bullion outputs can be expected as soon as the mill is ready for operation which will be a very few days, as everything is in readiness at the mine to put the mill in place without delay.

The Baisley-Elkhorn Mining Company, L. W. Nelson, manager, also received their second Bryan mill from San Francisco, the last of their shipment of machinery for the large 60-ton mill now being constructed on the Baisley-Elkhorn mine, which for the past two years has yielded an output of about \$10,000 per month with two Huntington mills. With the increased milling capacity, the Baisley-Elkhorn will take its place among the largest gold-producers in the Northwest. From every section of Baker county comes the most encouraging reports of mine development, and it is conservative to say that before the summer is over a dozen more mill plants will be erected on mines ranging in distance from Baker City of from 5 to 20 miles.

WHITE SWAN OUTPUT.—Bullion outputs from the White Swan mine have commenced again, the delay in operations for the past few weeks having been caused by a breakdown of the mill. Now that the mill has been repaired, regular bullion outputs will result. Yesterday S. B. Baisley, the manager of the mine, brought in 7½ ounces of bullion, the result of 11 days' run of the mill on the lowest grade ore in the mine. The ore now being taken from the mine, Mr. Baisley says, is as rich as ever, and the ledge keeps its width beyond all expectations.

WASHINGTON.

PLACERS ON THE SKAGIT.—Seattle Mining News, April 15: Placer mining has been carried on in a primitive way for years on the Upper Skagit river. At present this district is only accessible from British Columbia side, but a trail will be cut through from Hamilton up the river this season, which will make the trip much shorter and bring the district into greater prominence. A few hardy prospectors are already on the ground, having braved the snow and cold of the mountains and tramped 90 miles to get in there. Although only the old windmill system has been employed, the results have been quite satisfactory, as the gold in the river is very coarse. A company of Scotchmen is now making arrangements to take in pipes, etc., necessary for mining on the most improved hydraulic system. It has a bench 150 feet high and 40 or 50 acres in extent at the junction of Ruby creek and the Skagit which it will work, and which is rich in gold.

CHEWELAH NOTES.—A big strike at a depth of 320 feet in the Eagle mine, three miles east of Chewelah, is reported. The force of men will be increased at once. The mine is owned by Spokane parties. The Bulldog mine, seven miles west of Chewelah, is said to contain a ledge of solid blisnuth and silver 18 feet in width, lying between walls of marble and graphite. A concentrator is expected to be in operation on the Jay Gould within two months. The ledge on this claim is 16 feet in width and runs from 20 to 400 ounces silver. The Albino, which was purchased last winter by the colored men—Paul, Thompson & Co.—is being developed, the shaft being now 75 feet in depth, and running into chloride ore. The company will soon increase the force of men to 100 on the Capital iron mine. The shipments from this mine have averaged 60 tons per week through the winter, but with the larger force of men, a much larger output will result. The starting of the Spokane smelter would be hailed with joy by all owners of mining property in this vicinity, and a large amount of ore and fluxes could be had in the valley. Among the silver-lead claims that would be good producers may be mentioned the Eagle, Jay Gould, Fred B., Saratoga, Arlington, Enterprise, Finley, Harford, the Summit group of nine claims and a large number of others, to say nothing of a large number of copper-silver claims. Situated as the Chewelah mining district is, it can only be a question of a few months when the many advantages as a mineral producer of this district will be recognized. The Eagle mine will ship another carload of ore this week. Over 50 locations have recently been made on iron ore, and some of the top croppings are very fine.

MECHANICAL PROGRESS.

CAST IRON PIPE PRODUCTION.—The first publication of the statistics of cast iron pipe works separate from the operations of the general foundries of the country, is a recent census bulletin prepared by Dr. William M. Sweet, special agent. The bulletin shows that during the census year 1890 36 establishments reported the manufacture of cast iron pipe as a leading specialty of their business. The total capital invested in these works was \$14,300,933, which includes \$68,500 reported by two establishments not in operation during the census year. The hands employed, including officers and clerks, numbered 7788, to whom \$3,794,407 in wages was paid. Total cost of materials consumed was \$9,483,389, and the value of the products was \$15,168,682. The principal material consumed by the pipe foundries was pig iron, the quantity used amounting to 591,258 net tons, costing \$7,860,407, while cast iron pipe formed the principal product, the output being 513,030 tons of 2000 pounds, valued at \$12,556,315. The pipe foundries in operation in 1880 were tabulated with other foundries of the country, so that no data are available for comparison. There has, however, been a considerable growth in this industry during the past decade, especially in the south and west. The returns for 1890 show that 20 of the establishments reporting were built since the census of 1880.

FIBRE GRAPHITE.—The Holmes Fibre-Graphite Manufacturing Company was recently organized in Philadelphia to engage in a new industry, says the *American Manufacturer*. This is the manufacture of a material to be known as fibre graphite for bearings. It is prepared in a very simple way. Graphite in a finely divided state is mixed with wood fibre, then the mass is pressed into a mold arranged for proper drainage, and pressure put upon it, so that the fibres, guided by the escaping water, shall assume a position perpendicular to the bearing surfaces. The ends of the fibres, intimately mixed with the graphite, which is solidified under great pressure, are thus presented to the revolving journal. After air drying, the solidified mass is saturated with linseed oil and thoroughly baked. The fibres, however, are not carbonized. The result is a mass of graphite, metallic in appearance, showing no signs of fibres, except upon fracture, and presenting smooth, satiny surfaces. The material is somewhat harder than the graphite of a lead pencil, but quite strong enough to bear pressure and resist wear.

COMMON SENSE APPLIED TO PRACTICE. In a series of papers under the heading of "American Supremacy in Applied Mechanics," by Coleman Sellers, E. D., the following reference is made to the well-known Pelton wheel: "One of the most noted instances of the practical solution of a mechanical problem is given in the development of the Pelton water wheel, a system worked out entirely by and through experimentation. Results have been achieved by these improvements on wheels that were among the earliest used, so that the history of the Pelton wheel is typically American and stands as a monument of human ingenuity meeting the definition that has been given of mechanical engineering, common sense applied to practice." Such an indorsement of the Pelton system of power by so distinguished an authority will have great weight with the engineering profession, as well as afford general assurance—if such were needed—that the claims made for this extraordinary development in hydraulic force are in no way overstated.

NEW WELT MACHINE.—A new welt machine has been marketed, says the *Manufacturers' Gazette*, and is attracting considerable attention among shoe manufacturers. This machine differs from anything else in this line in existence, inasmuch as it makes a seam equally tight and close to those made by hand. The loop prevents the thread from cutting through from channel to leather in the working of light and flexible soles, while the insole and seam are prevented from being drawn out of shape by the inward pull of the needle. The machine makes no distinction in the sewing of toes of various widths, a narrow one being just as evenly and securely done as a wide one. Provision is made in the working of a narrower feather by having a single thread on the welt, as it is unnecessary to provide space for the four threads that comprise the loop stitch, and in stitching the sole to the welt, the stitch may be placed closer to the upper, leaving less margin between the stitch and upper, thus obtaining a closer

edge and a feather that will not roll up. Accompanying the welt machine, an outsole or fair-stitch machine containing many original features has been perfected.

ANALYSIS OF CHROME IRON ORE.—According to an article by Herr C. Hausserman, the moisture is determined by heating the finely powdered substance at 100° Cent., and then 0.5 gramme is mixed with 4 grammes of a mixture consisting of three parts of potassium carbonate to one part of caustic soda. The whole is first heated in a covered platinum crucible over a small Bunsen flame for two hours, after which the fusion is completed over the blowpipe, the liquid of the crucible being removed. After cooling, the crucible and contents are boiled with water in a deep porcelain dish; the solution so obtained is acidified with sulphuric acid and made up to a litre. Should a sandy powder remain in the dish, it is evident that the material has been insufficiently powdered and a fresh start is necessary. The solution having been satisfactorily obtained, titration with ferrous-ammonium sulphate is performed, the strength of the ferrous-ammonium sulphate solution having been previously standardized against pure potassium bichromate.

ELECTRICAL INDUSTRY.—The electrical industry, says the *Review*, like many another child, has at times grown beyond its strength. It has always recovered itself quickly, however, and any instability which may have been apparent has been but temporary. The business in general is now in the throes of a mild revolution and people are looking to see where and upon what they stand. Yet withal every one is cheerful and this is characteristic. There are combinations in progress and may be more to come. This we may regard as the prime cause of the present restless feeling, although not the only one. Business is good and collections are fair to middling. In this way matters are slightly compensated. A general purpose on the part of the large companies to reduce expenses, improve products and clear out the "fakirs" seems evident; good results will surely accrue from such a movement. One of the chief dangers which manufacturing companies in the electrical business must guard against is over-capitalization. The evils of this system are sure and sometimes sudden.

FENDERS FOR CARS.—It is interesting to note in the annual report of the Massachusetts Railroad Commissioners the statement that no fender has yet been found which is efficient for the saving of life. Some fenders have been tried since the introduction of electric cars, but the results are not satisfactory; on the contrary, the fenders appear to have been in more than one instance an additional peril to the person who has had the misfortune to get under an advancing car. It would seem that the invention of a satisfactory fender ought not to be difficult, but the fact that cable cars are still without them indicates that the invention has not been made. Cable cars are much more dangerous than electric, if only for the reason that their direction of travel cannot be reversed. The probability is that as people become accustomed to the swifter motion of mechanical cars, they will cease to gauge them by the slower standards of animal cars, and then there will be fewer accidents. But of course the greatest safety can only be attained by having the tracks above or below the surface of the street.—*Electrical Engineer*.

THE RELATION OF ELECTRICITY TO MECHANICS.—Electricity may and is certain to revolutionize many of the industrial methods and conditions of life and have a powerful effect on all. Yet, howsoever great this effect may be, it can but intensify and make more certain our dependence on machinery. Electricity, the great revolutionizer, banding together for instant communication the most parts of the earth; transmitting at our pleasure speech, light, heat or power. In the hands of the physician or surgeon, a gentle messenger of mercy; in those of the executioner, an avenger. Most simple of all power in its practical application; most wonderful in the diversity of its uses; most mysterious in its methods of operation; who can but watch with an absorbing interest its development in the service of man, fascinated by its mystery and marvelous works; already exerting an influence in industrial affairs little realized, except by a few, yet this influence only faintly foreshadowing that of the near future.—*The Northwestern Mechanic*.

PLATE ARMOR.—The *Philadelphia Press* has advices from London stating that an important contract was signed by the Russian Government with the Harvey Steel Ar-

mor Works of America. Their process for treating plate armor makes it 40 per cent more impenetrable to projectiles than any other treatment so far discovered. A Harvey plant will be erected immediately at the Aboukoff Armor Works, to miles from St. Petersburg, where American steel armor will be made for Russian ironclads. The Russian Government is not putting up this plant as a tentative thing, but to carry out a specific contract entered into by Government officials.

STEERING BALLOONS.—Balloons were recently used by the German soldiers, on the borders of Russia, to observe the military movements in the country last named, and some of the observers conjectured that the Germans have made great improvements in the steering appliances.

SCIENTIFIC PROGRESS.

Strength of Aluminum Wire.

Alfred E. Huot, President of the Pittsburg Reduction Co., contributes to the *Journal of the Franklin Institute* a chapter on "Aluminum; Its Manufacture and Uses from an Engineering Standpoint." From this, we take the following paragraphs:

"It will be noted that the tensile strength of aluminum wire runs up very considerably over that of the rolled metal. This is due to the peculiar property of aluminum to harden under work. The metal requires frequent annealing in rolling, and if it is to be drawn into wire with as little annealing as possible, the tensile strength is increased very considerably. This property of the metal is increased, especially if the aluminum is alloyed with a small percentage of copper, titanium or silver.

"It is perfectly feasible to produce a wire of aluminum alloyed with a small percentage of silver, titanium or copper, which will have a tensile strength of 80,000 pounds to the square inch, and which will have, weight for weight with copper wire, an electrical conductivity of 170 to that of copper being 100. When it is taken into consideration that the copper will only have a tensile strength at maximum of say 30,000 pounds per square inch, against the 80,000 pounds strength of the aluminum-titanium alloy, and when the further fact that iron or soft steel wire has only a conductivity of 17 in the same scale, and has a less or at most only an equal tensile strength per square inch with the aluminum-titanium alloy, a wide field for usefulness for electrical conductors seems opened for the metal, even at present when the price of the wire of aluminum-titanium alloy will necessarily be considerably higher; but when such an alloy can be produced in fine wire at a price of say 15 times that of the iron wire, pound for pound, then as the section can be reduced, the aluminum-titanium alloy will be the cheapest as well as the most advantageous for electrical conductors.

Two things, however, should always be borne in mind in considering the applicability of aluminum for given purposes in the arts. The first is that the properties of the metal are very considerably changed as regards strength, tenacity, hardness, rigidity and color, by alloying it with small percentages of other metals—conditions that do not materially change the specific gravity of the metal. The second is the relative weight of aluminum. Taking the tensile strength of aluminum in relation to its weight, it is in plates as strong as steel at 80,000 pounds per square inch ultimate strength, and in cold drawn wire as strong as steel at 180,000 pounds ultimate.

AIR PRESSURE DURING THE SOLAR ECLIPSES.—Observations of air pressure during a total solar eclipse reveal an influence of the latter phenomenon on the former, according to Herr Steen in *Annalen der Hydrographie*. He studied the eclipse of August 29, 1886, in this respect, using the records—at intervals of a quarter of an hour—of 14 Norwegian ships between Panama and Madagascar, of which four were in the zone of totality and at least four others quite close to it. Having first eliminated the daily period of air pressure, he groups the observations of the ships and forms means; and he finds both these and the individual records reveal two maxima of air pressure, separated by a minimum. In the totality zone the first maximum is 35 minutes, and the second 2 hours 15 minutes, after the middle of the eclipse; in the partial zone, the first is 25 minutes before, and the second 1 hour 40 minutes after, the middle. This double wave Herr Steen explains thus: During a solar eclipse day is changed to night for a short time, and the transition is much like the ordinary change from day to night in the tropics, where the

twilight is but short. There the curve of air pressure has regularly a maximum about 10 P. M., some time after sunset, and a minimum about 4 A. M., shortly before sunrise; while a second maximum appears about 10 A. M. It is natural a total solar eclipse should act similarly.

GLASS TUBES OF LARGE SIZE.—Glass tubes of large size are costly when produced by the ordinary method of blowing, owing to the fact that none but the very best workmen can produce them. The ordinary method of coating only admits of the production of short tubes of considerable thickness. In a memoir on the manufacture of glass pipes of large diameter, by L. Appert (*Bull. Soc. d'Encouragement l'Industrie Nationale*), improved machinery for casting and molding such tubes is figured and described. The molten glass in the required state of fluidity is run into a strong iron mold, which is then closed, and the workman regulates the rapidity of the passage of the spindle or core according to the dimensions of the tube. The mold is then opened and the tube taken out for annealing. With tubes of 100 mm. diameter, 15 can be made in an hour. Two metres is a usual length, which would give 30 metres an hour, but of that 20 per cent must be deducted for failures, giving an effective output of 24 metres an hour, or about 500 metres per diem. Four men and a boy are employed in the work. The power—steam or compressed air—required for driving the cone or spindle is very slight. The facility of working is greater with the larger size of tubes. The *Journal of the Society of Chemical Industry* says the method of connecting the tubes depends on the use to which they are put, metallic joints being used for tubes designed for the passage of water at high pressure.

COLORS TO STAND LIGHT.—In the treatment of fabrics to be colored, says the *Manufacturers' Gazette*, experts now declare a lizarine red and alizarine orange to be the two fastest colors of their class that can be produced to stand light. Another point emphasized is the inutility of putting together a fast and a fugitive dye in one combination; in case of a compound shade from fustic alizarine red and logwood, upon a chrome mordant, the logwood soon fades, the balance of color is destroyed, and the red or yellow becomes prominent. Alizarine blue, as compared with indigo, does not come out well; the dark dye seems to stand, but the light shades show that an active destructive action has been going on. It is concluded not to be as fast as indigo to light, but still a good color. Fustic is the fastest of all the wood colors and the fastest of all yellow dyes of any sort. Samples of wool dyed with pure fustic extract on chrome mordant, on being exposed for 40 days in different sections, inland and shore, retained a deep color, but no fresh bloom.

ALUMINUM UTENSILS.—Are aluminum utensils dangerous? Not at all, it would seem from the experiments conducted by Prof. George Lunge. He and his assistants have found that beer, tea and coffee are entirely without action on the metal, while the action of alcoholic liquors, such as brandy, is extremely slight. The influence of acid liquids, such as wine, sour milk, fruit juices, etc., is more pronounced, but practically of no importance. Besides, the salts of aluminum are not poisonous in the ordinary sense of the word. The announcement is of special interest at the moment, when aluminum spoons are being manufactured, and have been, or soon will be, placed upon the market. They may be safely used for all liquids ordinarily found in the household.

MOLECULES IN AIR.—Curious evidence shows that a cubic inch of air at sea level contains about 350,000,000 molecules. If the law of regularly diminishing density holds good, a cubic inch air at the height of 100 miles will contain about 350,000 molecules, and at less than 222 miles only 1 molecule. Opinions differ, however, as to the actual height of the atmosphere's upper surface. Prof. Young declares that no definite upper limit can be stated, while Prof. Forster of Berlin contends that a thin air, connected with that of the earth, pervades the whole solar system.—*Chicago Journal of Commerce*.

NEW METALLIC BLEND.—It is reported that a company has been formed in London under the title of Pidot's Iron-Silver and Ferro-Bronze Syndicate, limited, for the purpose of bringing into the market the new metallic blends known as iron-silver and ferro-bronze, the invention of Mr. Henry Pidot. The iron-silver, which is made on a base of iron and copper, is whiter, more ductile and malleable than nickel-silver, German silver, or oriole.

METALLURGICAL.

AMERICAN AND ENGLISH ASSAYS.—Last year the Anaconda Mining Company took a step in advance by declining to sell copper matte in England upon English terms and deductions, so far as the settlement was concerned, bills being made out and settled for at so many pence for so many pounds of fine copper; says the *Engineering and Mining Journal*. The result was not reached without some grumbling on the part of English smelters, and now Mr. Haggin has made another further and radical advance in declining to sell any longer by the Cornish assay, insisting upon the wet analysis, with the allowance of 1.3 units, customary in this country. Upon these terms 1800 tons of argentiferous matte were purchased by a large Liverpool house, followed by a second purchase of 600 tons by another smelter. Since then, large contracts have been made on the same basis, amounting to many thousands of tons. It is but a step further now to compelling all foreign buyers to accept American assays and weights, since American methods of assay and weights are conceded. In the present state of the market for furnace material it requires the concurrence of only two or three American producers to obtain this concession. As is well known, some of our largest copper miners never sell on any other basis.

ANOTHER MODE OF MAKING BRIQUETTES.—The conversion of coal dust into fuel has for a long time been accomplished by various simple methods differing but slightly in their details; but it has recently been proposed, instead of the usual plan of using pitch to cement coal dust together to form briquettes, to resort to substances of a glutinous or a farinaceous character, these including those obtained from wheat, barley, rye, or other cereal or vegetables, 5 per cent to 95 per cent of coal dust being found to constitute a suitable proportion. The mixture may be kneaded by hand and sets in a short time, so that molding under pressure may be resorted to for securing rapid manufacture. The product is said to burn with less smoke than the ordinary briquettes, and it is claimed that, in the matter of cost, the new article is the more economical. Ashes or refuse matter from coal fires, with or without fresh coal, may also be utilized.—American Manufacturer.

STEEL VS. IRON.—There has been considerable talk of late to the effect that steel is fast taking the place of iron, and that in consequence the iron-working industry is rapidly declining. There is no doubt that there is some truth in the statements, but in the opinion of some of the most prominent iron workers, the iron business is not knocked out, but only crippled for the present. D. B. Oliver, when asked by the *Manufacturing Gazette*, whether the iron business will be crowded out by steel, said "No. While the iron business is very depressed, I am not of the opinion that it is going to be knocked out completely because of the advantages that exist in the manufacture and in the uses of steel, and its supreme adaptability to so many purposes formerly filled by iron. The use of steel will be constantly on the increase, but there are uses for iron that steel will not meet so well, and there will still be a demand for it."

REFRACTORY BRICKS OF MAGNESIA AND CHROME IRON ORE.—Herr Leo ignited a sample of magno-chromite from Tampadel in a Deville blast-furnace to ascertain its capability of withstanding the temperature of an ordinary open-hearth steel furnace. The sample had the composition: Chromic oxide, 35—42 per cent; ferric oxide and alumina, 19—22 per cent; magnesia, 16—18 per cent; and silica, 3—5 per cent. The lining of the Deville furnace was of magnesite, and a magnesia brick and a Dinas fire-brick were heated at the same time for the sake of comparison. The result of the experiment shows that the chrome iron ore and the Dinas brick were completely fused, while the magnesian lining and the magnesia brick were unaffected by the heat and unattacked by the fused sample.

THE LAST OF ANTIMONY MINING IN GREAT BRITAIN.—Antimony is about to disappear from the periodical statistics relating to the metalliferous mineral production of Great Britain. The Glendinning antimony mines, situated at Westerkirk, in Dumfriesshire, have just been definitely closed, and most of the machinery has been sold. The mines were first discovered in the year 1760, but they were not regularly worked until the year 1793. The ore, which was sulphide, yielded about 50 per cent. Operations in the mines were discontinued

a quarter of a century ago, but of late years work has been taken up by a company, which has now, however, been forced to forego bringing the ore into a market at a loss, the price of antimony on the London market having declined to barely £50 per ton.

ANTI-SULPHURIC ENAMEL.—Acid spray from a battery of accumulators is said to be a great deteriorating agent where metal fittings and brass or copper conductors are about. A London firm set to work and invented an anti-sulphuric acid enamel, which is now largely used in many electrical works. For coating woodwork, iron and copper in the neighborhood of batteries, it seems to have proved itself thoroughly successful, and the long list of names of electrical firms using this enamel shows its usefulness. Even with strong sulphuric acid it will resist for weeks. It is also a perfect protection against acid spray. It is applied exactly like varnish, in black or other colors.

ELECTRICITY.

A Test of Electrical Rock Drilling.

An instance of successful electrical rock drilling says *Stone*, is the one afforded by the Government work at Rock Island, Ill., where it owns the largest arsenal in the country, and for some time has been engaged in deepening a portion of the southern channel of the Mississippi, which here flows from east to west. This is done with the two-fold purpose of securing a more plentiful supply of water power, which is used at the shops on the island, and to provide a navigable channel at Moline, which has heretofore been debarred by shallow water from sharing in the commerce of the nation's greatest river.

The electric drilling was employed on a strip of limestone rock 600 feet long and of an average width of 50 feet, the remainder of the rock being of a softer shaly sandstone that is more profitably drilled and feathered off by hand. Nine drills were used on the work. Eight of these were mounted tripods in the usual manner, while one, somewhat larger in size, was mounted on a carriage, and wheeled about on a temporary track. The machines used were the regular Van Depoele reciprocating drills.

Current was obtained from a generating plant installed in a temporary power house erected on the island. This building was, in addition to a rough pumping station, put up by the Government for the purpose of clearing the bed of the river from water coming from leaks in the water-dam and from springs. It was utilized in driving the generators, steam being furnished by a 40 horse power boiler. The generating plant consisted of two Thomson-Houston dynamos, with revolving brushes. It was found convenient to utilize the dynamos and circuit of the drilling plant to explode the dynamite with which the holes were charged.

The results of this work demonstrated that the use of electric power was about one-half in cost compared with hand drilling in the harder rocks. In soft shaly rocks the difference was not so apparent, mainly because comparatively little drilling is necessary in proportion to the rock taken out.

Overhead Electric Railways.

The rapidly increasing introduction of overhead trolley systems, in spite of the enormous opposition which has been brought to bear against them, especially in the cities of Brooklyn and Philadelphia, must be taken as evidence of their advantages and applicability to street railway traction. Moreover, says *Electricity*, we have ample proof of the popularity of this system wherever it has been in operation for any length of time, in the unqualified indorsement which has been given to it by the mayors and others of such cities when appealed to for their experience as to its safety and value as a means of rapid transit.

We also have the positive statement that no loss of life has ever resulted from purely electrical causes, and although any vehicle is liable to injure a foot passenger occasionally, the statistics of the West End road of Boston show that the proportion of accidents between the electric and horse car lines have been greatly in favor of the former. In spite of statistics, however, there is a large proportion of the community in cities where electric traction is proposed, who strenuously oppose it, and it would be interesting to know the grounds upon which these objections are based. The element of danger to the public has been too thoroughly investigated and disproved to be any longer an available argu-

ment. Another objection which carried some weight two or three years ago was that the system was still new and crude, and had not stood the test of time, but this is also known to be settled now in favor of the trolley system. Another, and perhaps the least reasonable argument, is that superior systems are coming up every day, which will soon put the overhead system in the background. These others have been tried and the trolley still is ahead, an example, it has been said, of the "survival of the fittest." Such an argument is, if considered seriously, of very little weight, as no advance would ever be made if railways should wait for expected improvements, as there is no system, however perfect, that is not liable to improvement. There is also an objection, purely esthetic, raised against the appearance of the street when equipped with overhead wires. But what is the disfigurement in this case in comparison to that of an elevated railroad, and who is there that questions the benefit of the latter or disputes the enormous increase in the value of business property along its route?

The agitation of this subject, which has recently been so severe in Philadelphia, has brought out all these objections, portrayed in vivid colors in the daily papers, and in this case the one possibly valid argument against the franchise has nothing to do with the merits of the system. Giving away valuable franchises to a company without remuneration to the city, is not to be defended, but extravagant abuse of a reliable and efficient system has a tendency to react in a direction opposite to that in which it is intended.

UNDERGROUND WIRES AND CABLES. In the report of the Committee on Underground Conduits and Wires, which was read at the Buffalo Convention of the National Electric Light Association last February, says the *Electrical Age*, some very important and interesting facts were set forth, but which, on account of being involved with other questions, are liable to be lost sight of. Take for instance the statement that, with very few exceptions, the system and plans heretofore adopted in laying wires and cables underground in this country have proved failures. This assertion, no doubt, was a surprise to many, and the question naturally arises, "Why have they proved failures?" The reasons therefor are numerous, but can be summed up in a few words, namely, too much economy in the matter of insulation and carelessness in handling. The committee found in its investigations that in some cases there was insufficient insulation used, and in many others carelessness in laying the conduit or drawing in the cables and wires caused much of the trouble. It calls attention to the fact that it is absolutely necessary that all work and materials in connection with underground wires should be first class, and that it is poor economy to use any but the best. More intelligence should be used by the workmen in drawing the cables in and out of the ducts and working in the manholes. Much of the damage, the committee states, is done at these times.

ELECTRIC COOKING.—Cooking by electricity is becoming, as we prophesied, quite the fashion. We notice that the proprietor of the Eldon Dining Hall and the Pineapple Grill at Newcastle-on-Tyne has had trials of this novelty in cooking. At the former place on Friday some cutlets, and at the latter on Sunday a thick chop, were cooked by this new process—the cutlets in seven minutes and the chop in 14—to the entire satisfaction of the managers and chefs. We believe electric cookers are being fitted in several of the West End flats in London. They deserve to be widely adopted. Mr. Dowling's demonstrations at the Crystal Palace will greatly foster this cleanly and easy method of everyday cooking.—London Electrical Engineer.

ANOTHER ELECTRIC RAILROAD.—The preliminary survey for an electric railroad running through the center of Vaca Valley has just been completed. As laid out, it will be a little over ten miles in length, tapping a most productive territory. While it will be valuable for the transportation of passengers, the object is to provide means for transporting the great fruit product of the country traversed. It is estimated that the minimum traffic will exceed 15,000 tons of fruit per annum exclusive of ranch supplies. The cost is estimated at \$100,000. Vacaville parties have interested outside capitalists, and it is expected that 30 days will see the project under way.

A FLATIRON.—In the Brush Co.'s offices at Rochester, N. Y., can be seen a flatiron invented during the last few months, which is being tested for use in large laundries. The iron has a wire attached to the back for

heating it, and it is estimated that it can be brought to the necessary temperature in this way about 30 per cent quicker than the usual method. A soldering iron is also being tested for use, and there are many small machines with motors attached.

USEFUL INFORMATION.

THE BLACKSMITH.—The blacksmith occupied an important position among the craftsmen of the middle ages. The insecurity of life and property, which was one of the chief grievances of the times, made strength of material indispensable, whether to guard the shrine of a saint or to protect after a more homely fashion the family chest or coffer. The strength and durability of iron led to its use for these defensive purposes from early times. But the workman of the middle ages was not content to allow strength and ugliness of form to go together, but contrived to breathe a spirit of beauty into his designs without sacrificing the use to which the material was destined. Thus wrought iron formed the object of much artistic work both in England and abroad. Until coal came into general use, malleable iron was produced direct from the ore with charcoal fuel by continuous working. Sussex was from early times a chief seat of the iron industry. The earliest positive record of the trade there is contained in a grant made by King Henry III to the town of Lewes in 1266, by which the inhabitants were empowered to raise toll for the repair of the town walls after the battle. Every cartload of iron destined for sale which came from the neighboring "weald" was to pay one penny toll, and every horse-load of iron half that sum. In 1290 a sum of money was paid to a certain Master Henry, of Lewes, for the iron work to the monument of Henry III., in Westminster Abbey, which reminds us that talented smiths were brought often from long distances for important works.—Chambers' Journal.

TO KEEP IRON PIPES FROM RUSTING. A simple and economical way of tarring sheet iron pipes, to keep them from rusting, is as follows: The sections as made should be coated with a coal tar and then filled with light wood shavings, and the latter set on fire. It is declared that the effect of this treatment will be to render the iron practically proof against rust for an indefinite period, rendering future painting unnecessary. In proof of this assertion, the writer cites the example of a chimney of sheet iron erected in 1866, and which, through being treated as he describes, is as bright and sound to-day as when erected, though it has never had a brushful of paint applied to it since. It is suggested that by strongly heating the iron after the tar is laid on the outside, the latter is literally burned into the metal, closing the pores and rendering it rust proof in a far more complete manner than if the tar itself was first made hot and applied to cold iron, according to the usual practice. It is important, of course, that the iron should not be made too hot, or kept too hot for too long a time, lest the tar should be burned off. Hence the direction for the use of light shavings instead of any other means of heating.—Stone.

TRINIDAD ISLAND'S SUPPLY OF ASPHALT.—The Trinidad pitch-lake concession has been extended for an additional year on the original term of 21 years from Feb. 1, 1909, for every \$20,000 paid by the concessioners before Feb. 1, 1909, over and above the minimum sum of \$700,000 payable in the first 14 years, and the \$140,000 to be paid for the seven years' extension from Feb. 1, 1902. The Trinidad Asphalt Co. has also agreed that if by Feb. 1, 1892, it had not paid to the Colonial Government \$500,000, in addition to the \$50,000 permanent deposit in London, the company would give to the Crown a mortgage on all land it now possesses in Trinidad as collateral security for the balance then remaining of the \$700,000. The Governor of the Island complains that many persons are still illegally obtaining from government land or shipping from private land to which they have no title inferior asphalt, which injures the reputation of the Trinidad asphalt in New York, or it has to be purchased by the Barber Asphalt Company to prevent it being laid on American streets.—Paving.

FOR the intense actinic light required by photographers, Herr Putz of the Vienna Photographic Society uses aluminum instead of magnesium. The aluminum is mixed in powder with chlorate of potash, or is placed in thin leaves between sheets of collodion cotton impregnated with chlorate of potash. A brilliant, smokeless light is produced.

The Earthquake.

The earthquake which occurred in Central California on Tuesday morning was felt mainly in a district 35 miles long by 25 wide. Outside of that area, although the vibrations were felt, no damage was done. At Vacaville, Woodland, Winters and Dixon a number of brick buildings was injured and many brick chimneys thrown down. Another shock occurred on Thursday about 10 A. M., entailing some slight further damage to the buildings already injured.

The shock of Tuesday was in a general north and south direction. It was not violent, but was rather long-continued. The light brick walls common to country buildings were not strong enough in the towns named to withstand the vibrations, and more damage was done near the center of disturbance than has been the case with any shock since that of 1872. No persons were killed, and but few injured—none badly. The only building in this city which was damaged was the Old Academy of Sciences building, which was being repaired. The front wall, being improperly supported, fell.

The center of seismic disturbance was this time in Solano county. Before this, at the time of heavy earthquakes, the centers were in Inyo county, near Lone Pine, and at

Haywards, Alameda county. The damage this week was confined almost entirely to lightly constructed brick buildings and the chimneys in wooden structures, and all within the area mentioned.

A Department of Mining.

The bill introduced by Caminetti of California, creating a Department of Mines and Mining, has been favorably reported by the House Committee in Congress. It provides that there shall be an executive department of a general character, the duties of which shall be to acquire by examination and by practical and scientific experiments, geological researches, or otherwise, useful information on the subjects connected with mining in the general and comprehensive sense of the word, and to diffuse the same among the people of the United States. The Department shall be under the supervision of a Secretary of Mines and Mining appointed by the President. There shall be in the same Department an assistant secretary appointed by the President. The Secretary shall receive the same salary as is now paid to the Secretary of each of the executive departments, and the salary of the Assistant Secretary of Mines and Mining shall be the same as that paid the First Assistant Secretary of the Department of the Interior. The duties now imposed by all laws and parts of laws relating to mines and mining affairs exclusively, shall be performed by this Department. The Geological Survey and the Bureau of the Mint are to be transferred to this Department, and the sale of mineral lands of the United States shall be conducted under the auspices of this Department.

We have not seen the full text of this bill, but should be glad to see the various departments now exercising some jurisdiction over mining concentrated in one. The Mint Department, for instance, might turn over the collection of mining statistics, and the Geological Survey its Mineral Resource division to the new Department, or the Geological Survey itself be confined more to the mining field and take the whole division.

As it is now, the Mint collects the mining statistics of gold and silver and the Geological Survey collects those of other metals and minerals. Neither one provides funds enough to do the work properly, and the chiefs of the divisions are hampered and unable to accomplish what they should.

If the new Department were organized in such a way as to get experienced men, and not merely make political places, much good could be accomplished. The total mineral products of the United States in 1890 were worth \$652,099,218, yet as far as the Government is concerned it did not spend \$25,000 to find out how or where this money was made. The technology of the mining industry is entirely neglected. The Mint does a little and the Geological Survey a little, but neither as much as it should. The gentleman in charge of the Division of Mineral Resources of the Survey is competent and industrious, but he is not allowed money enough to do his work or employ assistants in the field. The Mint has more to do with coinage than with mines, and the work it accomplishes is insufficient and unsatisfactory.

It is to be hoped that even if Mr. Caminetti does not accomplish all he desires, in founding a new Department, he will at least call attention to the present unsatisfactory condition of affairs. But it is to be hoped his executive department will be created.

AMONG the items of the expenses of the Con. Cal. and Va. mine for March were: \$13,606.23 for supplies, \$32,606.23 for salaries and wages, \$25,719.50 for reduction of ores, and \$2485.15 for Comstock tunnel royalties.

CARSON, NEV., had a big "silver meeting" on Wednesday night of this week.

Battery and Car Samples.

We had a conversation this week with Thos. H. Leggett, president and manager of the Standard Cons. mine of Bodie, on the subject of car and battery sample assays, concerning which he had a letter in the PRESS of April 16th. The editorial comments on that letter Mr. Leggett takes exception to, inasmuch as they appear to connect him in some way with the practices in vogue at the Hale & Norcross mine on the Comstock. It was, however, not intended to convey the idea that he was doing as the Comstock men did. The object of citing the Hale & Norcross method was to show that the evasion of the law by the officers of that company, in relation to recording assay value of the ore, had worked to their profit and the detriment of the stockholders.

Mr. Leggett's point was that neither of the methods specified would give the proper information of the value of the ore, on account of the presence of the free gold. For silver mines it may be all very well, but not for gold. He says that he gives the information in the only proper way to give it in the case of a free gold ore. Over 60 per cent of the value of the ore from the Standard mine consists of free gold, while nearly 90 per cent of the entire product is obtained from the batteries and plates. Consequently a battery sample would not give the assay value, as an unknown quantity of free gold would remain inside the mortars.

Mr. Leggett claims that the only way to give the assay value of such ore as he is working is by adding together the value of the ballion product of the batteries and apron plates, the value of the concentrates from the Frue vanners and the value of the escaping tailings, the latter determined by daily assay. This sum, divided by the number of tons worked, in a month, gives the true assay value of the ore.

The manager contends that he is really complying with the law so as to give the exact information required in the best way, so he naturally objects to being classed with Comstock men who have been evading the law. A little free gold in a sample might bring the assays up high in some cases. That is to say, it would be impracticable to sample the free gold ore properly, without a special sampling plant devoted to that object. The physical conditions of the Standard ore are such as to prevent accurate sampling as long as the gold exists free as it does.

It would seem as if Mr. Leggett's point was well taken in the case of free gold ore. His method of getting the value covers the battery, plates, concentrates and tailings, as stated, which would seem better than a mere car sample or battery sample assay, for the reasons mentioned. It was not until Mr. Leggett took charge of the mine that this system was adopted and it certainly seems better than that previously in vogue.

Every millman knows that, in the case of free gold ores, the batteries hold a goodly proportion of the metal. A battery sample taken in the usual silver-milling way would therefore fall in assay value below the real value of the ore, just in proportion to the amount of gold caught in the battery.

LECTURES ON ZOOLOGY.—A course of popular lectures on zoology, illustrated with stereopticon views, will be given by the California Zoological Club under the auspices of the California Academy of Sciences at their hall, No. 819 Market St. The lectures will be given on Thursday evenings at 8 P. M. The series is as follows: 1. Creation by Law, April 21st. 2. Fundamental Groups of Animals, April 28th. 3. The Mammalia, May 5th. 4. The Mammals of California, May 12th. 5. The Bird, May 19th. 6. Song Birds of California, May 26th.

Stocks on Margin.

The decision this week, as to the illegality of the sale of mining stocks on margin, has come at rather a bad time for the stock market, but it has come none too soon. The system of dealing on margins is one of the greatest evils of the stock jobbing business, inasmuch as it enables those who cannot really afford to speculate, to engage in the business. Rich men with money to spare can afford such speculative transactions as are involved in the Pine-street markets; but men with small means almost invariably come to grief.

How many thousand people have become impoverished by this system, it is impossible to tell. But almost every San Francisco man can speak of some experience of his own or of his neighbor. Men put up every cent they can rake and scrape to cover these margins and the smallest kind of a reverse of the market "puts them in a hole," from which only more money will relieve them.

It is under such circumstances that men have, in their eagerness to save themselves, committed dishonest acts which eventually led to ruin. They have sacrificed families and friends, lost standing and respect, and become bankrupt. Keeping a margin good on a falling market is harder work than paying off a mortgage, because there is mighty little time to do it in. The evils of the system were long since recognized; but if it were stopped, and stocks bought only for cash, there would be comparatively little business for the brokers. They naturally therefore object to the decision just rendered, and will take the case to the Supreme Court.

The decision was for the plaintiff in the case of W. N. Wetmore against E. P. and Mary A. Barrett to recover, as he claimed, \$3380 for moneys had and received by them for his benefit. This they denied, but affirmed that they paid out at his request \$3380. The fact is the money was lost in mining stock speculations, and the opinion dealt at some length with the testimony in the case to show the character of the various transactions which passed between them.

Wetmore claimed to be entitled to recover the whole sum deposited with the Barretts, because the transaction is illegal and in violation of Section 26, Article IV, of the Constitution, prohibiting the purchase of shares of mining stock on margin.

The celebrated case of Cashman vs. Root, in which the Supreme Court first dealt with this point, was applied, but the defendants' counsel claimed that it had no bearing, because this action is for money paid as part of the purchase price of stock actually purchased for Wetmore as ordered by him. He had determined what stocks he wanted, and ordered them bought, borrowing the balance of the purchase price from the Barretts. Judge Levy's conclusions are as follows:

Plaintiff's dealings with Barrett were altogether on margin. When the value of the stock purchased did not amount to the sum paid, plaintiff was required to put up other stock as security or cash to keep the margin good. As the market fluctuated on purchasing stock, the cost price was charged to plaintiff less the amount of margin put up in cash. When sold, his account was credited with the amount realized. He was, of course, charged with the broker's commissions and the interest on the money advanced. Such were the facts in the case of Cashman vs. Root, and such are the facts in this case.

After careful consideration of the Cashman-Root case, taken in connection with Section 26, Article IV, of the State Constitution, I am clearly of the opinion that buying and selling of the shares of the capital stock of corporations in any stock board, stock exchange or stock market is void in this State, except the stock is delivered to the purchaser or paid for in full. The sale of any stock wherein the broker holds the certificate as collateral security for the balance of the unpaid purchase price, and has the option of selling when the stock depreciates, or holds it subject to the rise and fall of the market, is a contract void in this State.

BEHREND JOOST of the San Francisco and San Mateo Electric Railway states that the road will be open for traffic on Tuesday next, and that on Monday there will be a trial trip for the benefit of invited guests.

Vein Phenomena.

Mr. John B. Farish observed, during an examination of the Golden Age mine, Boulder, Colo., some interesting vein phenomena, which he described to the American Institute of Mining Engineers some time since. The relative location of the Golden Age and the Sentinel mines are shown in Fig. 1 of the cuts.

The Golden Age location covers the outcrop of a quartz-porphry dyke, which cuts through the granite country-rock with a strike of about N. 70° E. This dyke varies in width from a few feet, as at a point be-

the incline below the apex. The adit which cuts the porphyry dyke about 250 feet below the bottom of the shaft, shows this streak in the same contact.

Beyond the split, the lower or foot-wall streak stands a little steeper; and at the second level, 180 feet below the surface, it is found in the contact between the under side of the porphyry dyke and the granite foot-wall. It remains approximately in this contact, though occasionally found wholly in the granite, to the lowest explorations in the shaft.

The porphyry dyke varies in width on its dip as well as on its strike. On the third

seams and feeders that have enriched both veins come in from the porphyry dyke.

The ore from the Golden Age veins is somewhat remarkable, and the rich and magnificent gold specimens obtained from them are familiar to all the miners of Boulder county. It is a typical free-milling gold ore. A good percentage is saved by simple amalgamation on copperplates, the resulting bullion running over 900 fine; the tailings yield pyritic concentrates of fair grade. As a rule, the vein rock, especially when rich, is a hard, often flinty or vitreous, white quartz. The gold, especially in the hanging-wall vein, is seldom accompanied

chalcopryite; but the gold in the ore remains as free as elsewhere. In none of the openings were any tellurium minerals found by me; and Mr. Amsden says they are unknown in the Golden Age.

Returning to the surface, the Sentinel location covers the apex of a vein which appears on the surface enclosed in a belt of schistose or gneissic rock. It lies nearly parallel to, and about 100 feet south of the apex of the Golden Age vein. Only two shallow openings have been made on this vein on the surface; the deeper being a shaft sunk about 30 feet. In driving the adit, the first vein encountered was the Golden Age, on the hanging-wall contact of the dyke, and about 175 feet farther north, the Sentinel vein was reached in granite. An upraise was made on this vein to the lowest (No. 5) level from the main shaft, demonstrating that this vein dips south about 70°, and passes through the Golden Age vein on its course.

The Sentinel produces an ore entirely distinct from that of the Golden Age. It is the familiar bluish quartz of the tellurium veins of Boulder county, with the characteristic chalcopyrite, quartz crystals and finely disseminated pyrites. The value is in metallic gold, petzite and sylvanite. While most of the metallic gold was deposited as native gold, a certain portion has evidently been rendered free by the partial decomposition of the tellurium minerals. Some of this ore is very rich. One specimen found, weighing a little over two pounds, is valued at \$228.00.

The richest ore usually occurs in two narrow seams or streaks, often only a foot, but at times as much as 10 feet apart; the intervening space is more or less mineralized country-rock. The miners working as lessees on this vein, consider it richest in the schistose rock, and poorest when it is in the porphyry, on its course through the dyke. Though the openings on the vein, in the dyke, are limited, this opinion appears to be correct.

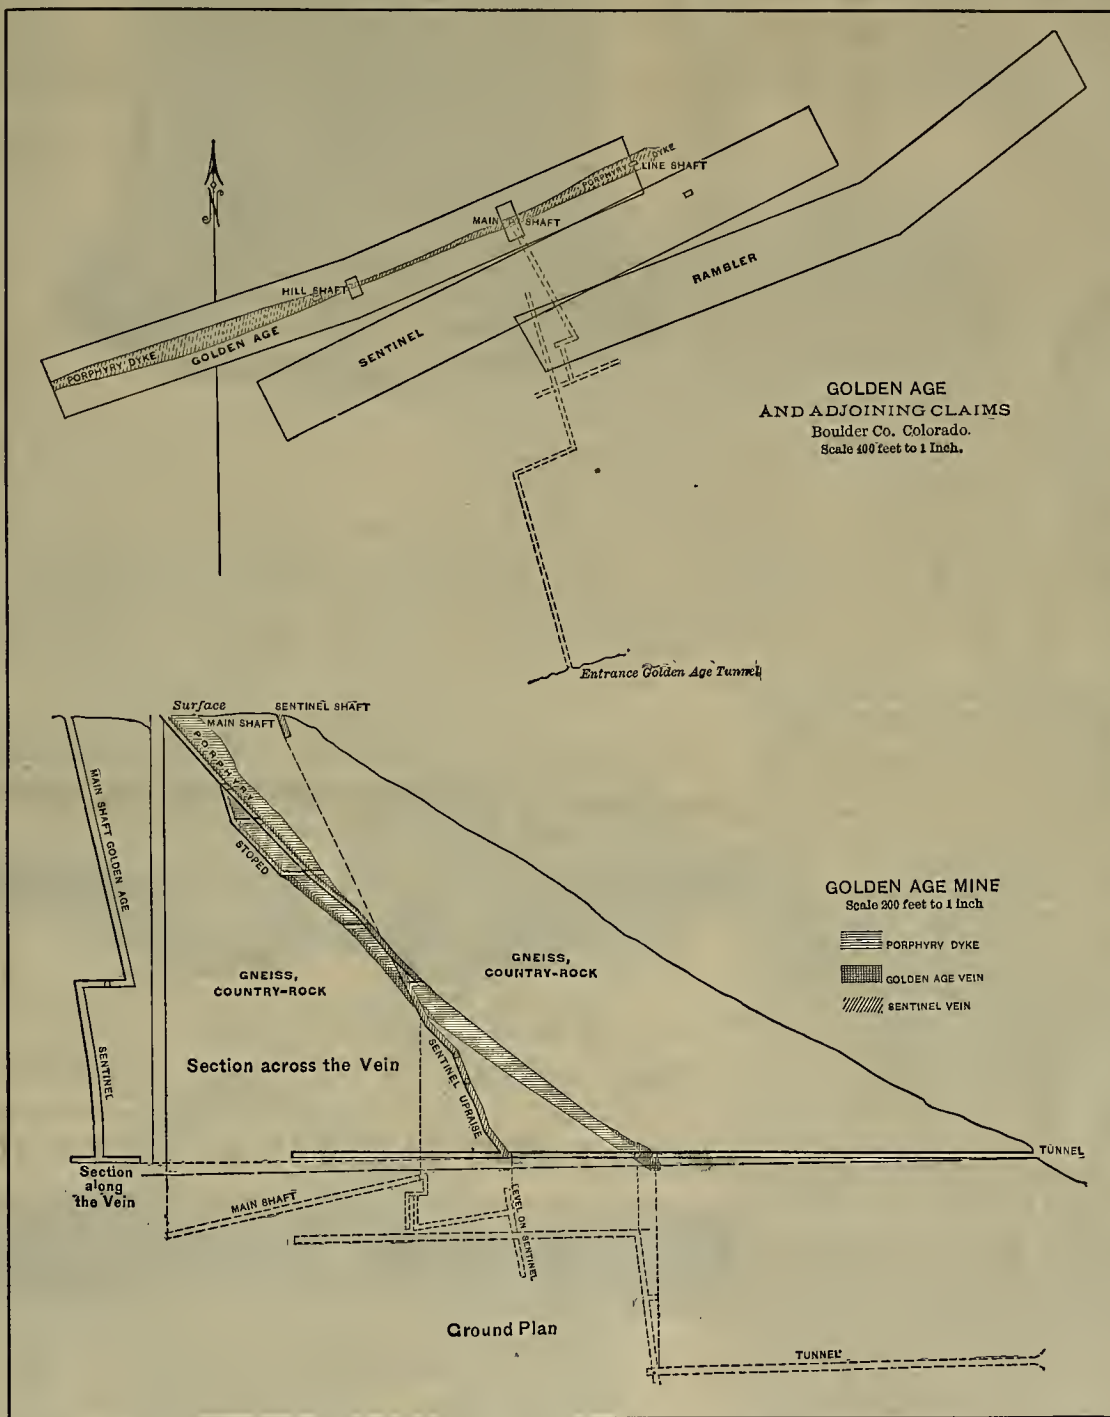

So distinct are the characteristics of these veins, that the crossing of the Sentinel through the Golden Age is plainly marked, being exposed in the main shaft and workings connected with it.

It is possible that the facts observed here confirm the opinion that the gold mines of Boulder county belong to at least two distinct periods of vein formation. To the first and earlier may be assigned the Golden Age, and the mines of Ward and other districts producing similar gold ores, free from tellurium minerals; to the second and later, the tellurium gold veins for which Boulder county is particularly noted.

That the ores from the Sentinel, or tellurium-vein, are of lower grade where the vein passes through the porphyry dyke than elsewhere, may be due to the formation of the Golden Age vein first.

This vein probably drained the dyke of much of its disseminated mineral values. Prospectors, as a rule, look for riches in larger veins of ore where veins unite or crosscut each other. In this property we have two interesting occurrences of this kind. The Golden Age veins unite at a point 100 feet down. These are similar veins of the same age. The result was larger and richer ore bodies near the junction. In the other case, the crossing of the Sentinel tellurium veins through the Golden Age veins, which was the passing of a later through earlier veins, produced no local enlargement or enrichment of the ore bodies. It may be inferred with probability as a general rule, subject of course, to local exceptions, that for the production, by the junction of two veins, of ore bodies larger or richer than are characteristic of either vein separately, the two veins should be of contemporaneous origin.

THE finding of a very large gold nugget is reported at the Planchas placers, Sonora, Mexico.

ORE BODIES AT THE JUNCTION OF CROSSING VEINS.

tween the main shaft and the Hill shaft, to about 50 feet, and dips about 45°, as shown in Fig. 2. The outcrop of the main ore-chute thus far explored on the Golden Age vein is marked by a line of surface works, extending along the contact on the lower side of the porphyry dyke, from the Line shaft on the east to the main shaft on the west. At the depth of about 100 feet the main shaft discloses a split in the vein. The upper or hanging-wall streak continues into the dyke on approximately the same dip, but with porphyry hanging and foot-walls, until a depth of 370 feet is reached, where it enters the upper contact, between the porphyry and granite, and remains in it to the bottom of the main shaft, 470 feet on

level a crosscut 47 feet long reaches the granite on both sides of the dyke, while in the adit the porphyry is passed through in 8 feet. It has been considerably acted upon by the vein-forming agencies in the upper workings; and in none of these openings was I able to secure a specimen that was not more or less decomposed. Where it is cut by the adit it is less acted upon, and shows considerable amounts of pyrites.

The Golden Age veins are well defined, often presenting a banded structure. They are inclosed in distinct walls, with selvages, which at times exhibit slickensides. So far as my observation went—and this was confirmed by Mr. Amsden, who has been foreman on the mine for ten years—the

by pyrite, chalcopryite, or any of the baser minerals. It is generally imbedded in the white quartz as bright yellow gold, ranging in size from coarse grains to nuggets, occasionally several ounces in weight.

One specimen, found by a former owner, contained 70 ounces of gold, nearly all in one piece. The footwall vein contains more of the base minerals than that of the hanging-wall. After it reaches the lower contact between the porphyry and granite, there is a marked increase in the quantity of these associated minerals, and this is still further increased when the vein leaves the contact and enters the granite. In such places, blende and galena appear in small quantities, with pyrite and considerable

The Gold Ores of Shasta County.

REDDING, SHASTA CO., April 16, 1892.

TO THE EDITOR:—I attended the first regular meeting of the Miners' Association of Shasta Co., held at Redding on the 2d inst. I was surprised and pleased to note the keen and intelligent proposals of the miners present to combine their united efforts in overcoming the enormous difficulties in the way of investing the smallest amount of money in mining and how to reap the largest reward. I find a grade of ore here of surprising richness and capable of large dividends if rightly handled.

A radical departure in mining here has been inaugurated by a company of practical men from Colorado, whose success has been surprising to most old-school miners of this State. While the principle of working mines in Colorado is different from California to a certain extent, it is one that in this county can be an exact duplicate.

Scientific and practical knowledge applied in our observation here shows that high grade ore of from \$200 to \$10,000 per ton has been milled here by the free-milling process and but a small part of the value extracted. The system employed by these Colorado men is one of simplicity and small expense; the hand-sorting of the ore and the shipment to the smelter, anything running less than \$40 consigned to the dump.

To the success of this system is necessary the application of the assayer's implements and knowledge, which I find is rather scarce. A fair knowledge of the ore's value determined, the shipping question is simple. Next comes the treatment of second-class ores, as in Colorado, by any process cheap and practical. Milling has been an almost absolute failure; concentration is attempted, and in some ores quite successful, but in the main, failure to extract a reasonable percentage is universal.

The application of the cyanide process is yet in its infancy and is watched intently; repeated trials of new appliances and new processes having failed, but small encouragement is given to any new departure until proven and adopted by some leading company. Investigating the failures of milling, and the present large losses from mills, I am face to face with a new combination of gold, or a wrong impression, which prevails. Before me is a piece of pure milky white quartz, without a stain and showing not a trace of mineral, yet assaying in gold up in the hundreds. Crushed dry, the values disappear in water. The gold passes into solution; long intervals of settling the water, final filtration and evaporation of the liquid showing large values. What form is this gold in, seems to puzzle Shasta county, and it is stated here that the ore in question has been submitted to Wm. Ireland, State Mineralogist, but has never been solved and no explanation has been offered by the learned gentleman.

The combination seems quite universal, which, to a certain point, explains the large losses. Is this a soluble chloride of gold or not? Is not the loss due to improper treatment of the slimes? Is not the loss a mechanical one and capable of being reduced by a more intelligent treatment of the slimes? "BOSTON."

SAFETY SIGNALS FOR MINE SHAFTS.—

A mining contemporary gives an account of an electrical apparatus designed for the prevention of accidents to miners while riding on the cages in the shaft, and which will also, it is said, tend to lessen the number of accidents occasioned by cages coming in contact with the chairs. The invention has been in successful operation during the past two years at the Drum Lummon mine, Montana, and it was devised by an ingenious employe of the company owning the mine. The arrangement consists of an electrical connection between the cage and the chairs on the different levels of the mine, and also between the cage and the engine room. An ordinary battery is placed in the bottom of the cage, and wire attached to it run through a contact piece to the side of the shaft, something on the same principle as the trolley on an electric street car. An ordinary push-button is placed in such a position on the cage that the station tender can readily reach it. Wires running down the shaft connect with the trolley on the cage, and at the other end are attached to a dial in the engine room. Another wire connects with the chair in the mine, and as the dial is in full view of the engineer, he can tell at a glance whether the chairs are set or not. Should an accident happen to anyone on the cage between two levels, by pressing the push-button the cage can be brought to a stop in a moment. In the ordinary way, with a hell-rope attachment, if the cage is going at even a low speed it is dangerous

to attempt to grasp the bell line, on account of the liability of getting an arm caught between the sets.—Colliery Engineer.

Workmen and Their Tools.

"Bad workmen," we are told, "always find fault with their tools." We might extend the significance of the axiom by stating that bad workmen make bad tools. We may satisfy ourselves as to its truth by a cursory inspection of the kit carried by a poor mechanic. In the machine shop we shall find our saying conspicuously exemplified. A glance at the condition of the tools, to say nothing of the surroundings, will tell us whether good artisans or second-rate workmen are employed, whether the shop turns out good or indifferent work.

The make of the tools has little to do with the settlement of the question. The finest machine tools ever designed may be ruined by ill-usage, and, in fact, as a general rule, the more perfect the machine the more susceptible it will prove to gross ill treatment. Moreover, a shop full of good tools ruined by ill-usage or neglect is a much sorer spectacle, to the experienced mechanic particularly, than an aggregation of second quality implements in a similar condition, and, as a general rule, a poor tool spoiled will do as good a job as the most expensive machine that has undergone maltreatment.

The appearance of the tool will betray the hand of the workman, no matter how badly worn. Fair hard wear is altogether different in its effects from willful misuse or the neglect that is born of ignorance. A man may wear a tool out, and it will still have an altogether different look to the one that has been deliberately or carelessly ruined.

It is a waste of good money, of good material and of the designer's abilities, to place in the hands of an ignorant or reckless workman a first-class machine. He would accomplish about the same result with the cheapest in the market, and feel just as well satisfied. A competent workman, on the other hand, will show his appreciation of a superior tool, both in the care he will take of it and the work he will make it accomplish. You would not find a good man, for instance, risking the ruin of a machine by forcing it to do work it was never intended for, because the tool he needed was temporarily unavailable, nor would it occur to him to overload or strain a machine. The man who uses his hammer to loosen a bolt because his wrench is not handy, or who makes a hammer of his wrench because the proper tool is not in its place, is an unprofitable servant, and will eventually prove a source of loss; and the man who will spend half an hour in fixing up a drill or cutter to suit his work, spoiling it for all future use, rather than devote a few minutes to a search for the exact article he requires, will never earn a mill for his employer.

It does not pay to fit up a shop with poor machinery if you want good work, nor do you want to put bad workmen in charge of your expensive tools. You are doing things by halves, introducing a hull into your china shop, and playing with fire in a manner that is certain to result in burned fingers. Good machines will never do good work in the hands of poor mechanics, and although a good workman will often do wonders with the poorest of tools the combination is not economical, and is usually unsatisfactory to employer and employed. Good tools operated by competent mechanics last longest, do the best work, produce in every way the most satisfactory results, and are always cheapest in the long run.—Safety Valve.

OIL FUEL IN GLASS FACTORIES.—Quite a number of the large glass factories are using Lima oil, at a saving of over 25 per cent on the present prices of fuel gas, based on a price of 67½ cents a barrel for oil delivered. By the new process the oil is transformed into gas, and then mixed with air on its introduction into the furnace. Among the glass factories now using oil as fuel are the following, according to the *American Manufacturer*: West Penn Glass Works, Blairsville, Pa.; Greensburg Glass Works, Greensburg; Agnew Glass Works, Hulton; Brownsville Glass Works, Kensington; Eagle Glass Works, Leasurville; Riversburg Glass Works, Wellsville, Ohio; North Wheeling Glass Works, Wheeling; Rodefer Glass Works, Bellaire, Ohio; Kerns and Gossick Works, Zanesville, Ohio; Penn Plato Glass Works, Irwin, Pa.

ARTICLES of incorporations have been filed in the County Recorder's Office at Phoenix, Ariz., for the Maricopa Gold and Silver Extraction Company, with a capital stock of \$300,000. The incorporators are all Denver capitalists and propose to transact a general mining business, operating by the new MacArthur-Forest cyanide process.

Instantaneous Electric Lighter

PRICE

\$5.00.

FOR PARLOR DINING ROOM OR CHAMBER.

OFFICE, STORE, CIGAR SHOP OR SALOON.

Electricity Generated by Chemical Action. A Handsome Ornament for Table, Mantel or Counter.

THIS illustration represents our ELECTRIC LIGHTER, and is one-half its actual size. It is complete in itself—requires no extra Power Wires or Connections. The Current of Electricity is generated by Chemical Action. It occupies a space of but SIX SQUARE INCHES.

A CHILD CAN OPERATE IT. Simply by pressing the Center Rod, the Current of Electricity is generated, and the light is instantaneous. It can be taken to pieces at will, and just as easily re-adjusted.

SECOND MY. The material to charge the Battery can be obtained at any drug store at a cost of Ten cents, and will run 30 to 60 days. Any part can be replaced at a cost not exceeding Ten Cents. Aside from its use as a lighter this apparatus does away with the use of matches and the dangerous results and disagreeable odors arising from same. We have taken especial care in the manufacture of these Electric Lighting Batteries, they are handsomely constructed in nickel-plated and highly ornamental and will take a prominent place among the bric-a-brac of Reception Rooms, Parlors, etc. Full directions and one charge for the battery accompany each apparatus.

All orders for less than \$20 must be accompanied by Postal Express Money Order or by Draft on New York. Goods shipped C. O. D. on receipt of Twenty per cent. (Remittances with order save return charges.)

LIBERAL DISCOUNTS TO TRADE AND AGENTS.

FRUE ORE CONCENTRATOR

OVER 3200 IN ACTUAL USE.

Price of 4-foot wide Plain Belt Frue Vanner..... \$350, f. o. b.
" " " Improved Belt Frue Vanner..... 800, f. o. b.
" 6-foot " Plain Belt Frue Vanner..... 800, f. o. b.

Manufactured under Patents of April 27, 1880; September 18, 1883; July 24, 1888; and March 31, 1891.

CLADSTONE MINING COMPANY, C. J. Clark, M. E. Gen'l Supt. FRENCH OULCH, Cal versus Co., Cal., Dec. 12, 1891.

MESSERS. ADAMS & CARTER, San Francisco, Cal.—DEAR SIR: During my experience in mining and milling, I have used twenty-four of your four-foot Frue Vanners on different kinds of ore, both gold and silver. I have no less commendative statements against them with other widely published concentrates and have always found the Frue in first place. When I built this mill (20 stamp), I determined to put in six-foot Frues in order to save space and machinery. I am now running four of your six-foot machines and they have been going for TWELVE MONTHS. They are taking the pulp from 20 stamps, crushing a minimum of fifty tons per day, and I do better work than the four-foot tables. They require no more attention than a four-foot table and handle at least twice the quantity of ore. I have run them up to 80 tons per day and could not see that they were crowded. They stop and start as easily as the smaller tables and have the advantage of double capacity with the same bearings and wearing parts, requiring no more oil, and no more wear and tear than the smaller tables. My repair account for the past six months has been too small to mention. In order to give an idea of the work they are doing, I will state that the ore has varied monthly from \$5 to \$20 per ton and this table has run from nothing to 60 tons per ton. I will conclude by saying that I cannot endorse the six-foot Frue Vanner too highly, and it is the only table that I would have in my mill.

C. J. CLARK, Gen'l Supt.

No. 132 Market Street - - - San Francisco, Cal.

"TRIUMPH" ORE CONCENTRATOR WITH IMPROVED RIFFLED BELT.

The competitive trials which have been held between the "Triumph" Ore Concentrators, the "Frue" Vanners and other forms of concentrating devices, do not warrant the assertion that the "Frue" Vanner is the best ore concentrator in the market. The fact that the "Frues" have improved (corrugated) belts does not militate against the superiority of the "Triumphs"; for, when desired, they (the "Triumphs") can be mounted with a superior belt known as the "Blasdel" Riffled.

Price "Triumph" Concentrators, with Improved (Patented) Belt - - - \$650 f. o. b.
Price "Triumph" Concentrators, with Plain Belt - - - \$550 f. o. b.

(PATENTED.)

Both the "Triumph" Concentrator and "Blasdel" (riffled) Belt are protected by incontestable letters patent, granted by the Government of the United States.

Original Empire Mill and Mining Company,
Principal Office, 401 California St., cor. Sanson, S. F.
Location of Works, Grass Valley, Nevada Co., Cal.
GRASS VALLEY, NEVADA CO., CAL., Nov. 10, 1888.

Joshua Hendy Machine Works, 39 to 51 Fremont St., S. F., Cal.

GENTLEMEN—I am pleased to state, in reference to the "Triumph" Ore Concentrators, that four (4) of them were placed in the mill of the Original Empire Mill and Mining Company in April, 1884, and a thorough test made of their practical operation; and their efficiency having been demonstrated, four (4) more were subsequently introduced as the complement of the Twenty (20) Stamp Mill, and the eight (8) have been and are now running with entirely satisfactory results.

At the Ten (10) Stamp Mill of the North Star Mining Company, under my supervision, four (4) are also in successful operation, and from my observation of their practical workings, I am convinced that this form of Concentrators is the equal, if not superior to any other style of Vanners or concentrating devices.

Signed] DAVID McKAY, Jr.,
Supt. North Star and Original Empire Mining Co.

N. B. When the stamping capacity of the two above named mills was increased, more "Triumph" Concentrators were purchased, and twenty-eight (28) are now in constant successful operation.

We are prepared to guarantee the superiority of the "Triumph" over the "Frue" or any other form of Concentrator, for coin if we be.

Circulars and testimonial letters furnished on application.

JOSHUA HENDY MACHINE WORKS,
39 to 51 Fremont Street, San Francisco, Cal.

THE BLASDEL

CONCENTRATING BELT COMPANY.

We have now made arrangements to have our new Improved Concentrating Belt manufactured in San Francisco. We keep always on hand Belts suitable for the Triumph and Frue machines, but can make any length or width desired. The advantages of these belts over any others will be readily seen by practical millmen.

First, the flanges or edges of our belt stand at an acute angle inclining toward the center, and therefore readily conform to the change of direction while passing over the end rollers, thus the vexation and loss caused by the frequent breaking of the flanges of the old style belt is practically done away with. Again, our belts, at intervals of two to four feet, have a very slight riffled surface for the space of three inches, which tends to equalize the pulp on the belt, and prevents it from banking on the sides and forming channels through the center. These slight riffles also save very fine sulphurets and the quicksilver that would otherwise escape with the tailings from a belt, the surface of which is entirely smooth. We can safely say that it is a better belt than has ever been manufactured for use on this coast. It will last much longer and will handle fully one-third more pulp than any smooth belt, and will save a higher percentage of sulphurets.

H. G. BLASDEL, Jr., Manager, 419 California St., San Francisco.

MANUFACTURERS OF THE

CELEBRATED

Bryan Roller Mill.

This Mill is a Modification of the well-known "Chile Mill," arranged for the Continuous Crushing of Gold and Silver Ores.

It is **POSITIVELY** the best Gold Amalgamator in the market. It saves from Five to Twenty-five per cent more gold than other mills. Its immediate and free discharge prevents the possibility of sliming. It requires a minimum of power and crushes hard as well as soft ore. Its comparatively slow speed insures freedom from excessive wear.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or and other ore crushing machines now before the public.

SHEET IRON PIPE

IRON PIPE

ALL SIZES, FOR GAS, STEAM AND WATER.

— WE MANUFACTURE —

SHEET IRON AND STEEL PIPE,

ALL SIZES,

For Water Supply, Mining, Irrigating Purposes, Stock Ranches, Etc.

Made in Lengths Desired from 16 to 30 feet.

The Cut shows a Section of Three Joints

DOUBLE RIVETED SHEET IRON PIPE.

In the manufacture of this Pipe, we use only a high grade of annealed Charcoal Iron of great tensile strength.

The weight or thickness of metal used, is graded according to service required, and pressure to which the Pipe will be subjected.

FOR ALL UNDERGROUND PURPOSES, we immerse the Pipe in a bath containing a special mixture of ASPHALTUM, BITUM and PETROLEUM, at a Temperature of 300° Fahrenheit. It thus receives a thorough coating, both inside and outside, rendering it impervious to the alkalies of the earth, rust, etc., and is practically indestructible.

NOBEL'S DYNAMITE, NOBEL'S EXPLOSIVE GELATINE, NOBEL'S GELATINE-DYNAMITE, AND THE JUDSON IMPROVED POWDER. Best and Strongest Explosives in the World.

JUDSON POWDER.

The only Reliable and Efficient Powder for Stump and Bank Blasting. Railroad Contractors and Farmer use no other. As others IMITATE our Giant Powder, so do they Judson, by manufacturing an inferior article.

BLACK POWDER.

The Giant Powder Co. having built Black Powder Works, with all the latest improvements, at Clipper Gap, Placer County, known as THE CLIPPER MILLS, offer this powder and guarantee it the best. CAPS and FUSE at Lowest Rates.

THE GIANT POWDER COMPANY, 30 California St., San Francisco.

ESTABLISHED 1866.

Pacific Chemical Works.

HENRY G. HANKS,

Practical and Industrial Chemist, Assayer and Geologist.

718 MONTGOMERY ST., - SAN FRANCISCO.

Will report on the condition and value of any mining property on the Pacific Coast. Rare Chemicals made to order. Instructions given in Assaying and Practical Chemistry.

Educational.

JOHN T. EVANS,

Assay Office and Chemical Laboratory. ROOMS 46 AND 47 MONTGOMERY BLOCK, 628 Montgomery Street, San Francisco. For nearly 16 years with Thomas Price, as Chief of the Ore-Assay and Analytical Department. Lessons given in Assaying and Chemistry.

School of Practical, Civil, Mechanical, Electrical and Mining Engineering, Surveying, Architecture, Drawing and Assaying, 723 MARKET ST., SAN FRANCISCO, CAL. Open all year.

A. VAN DER NAILLEN, President. Assaying of Ores, \$25; Bullion and Chlorination Ass'y, \$25; Blowpipe Ass'y, \$10. Full Course of Assaying, \$50. ESTABLISHED 1864. Send for Circular.

PACIFIC ENGINEERING SCHOOL,

121 Post St., San Francisco, Cal. PRACTICAL, ELECTRICAL, HYDRAULIC, CIVIL, MECHANICAL, and MINING Engineering, Surveying, Architecture, Drawing, Assaying and Navigation, GRAPHICS, Drawing and Mathematics for the trades. Send for circulars. Day and evening.

HOPKINS ACADEMY,

OAKLAND, CALIFORNIA. A FIRST-CLASS, SELECT School. Early application necessary. During year 1891-92, TWENTY-FOUR APPLICANTS were refused for want of room. Next term begins August 2, 1892. W. W. ANDERSON, Principal.

ACTUAL BUSINESS PRACTICE.

PACIFIC Business College, 320 POST ST. SAN FRANCISCO. LIFE SCHOLARSHIPS, \$75. DAY AND EVENING SESSIONS. Ladies admitted into all Departments. Address: T. A. ROBINSON, M. A., President.

HEALD'S BUSINESS COLLEGE,

24 POST ST., S. F. FOR SEVENTY-FIVE DOLLARS THIS College instructs in Shorthand, Type Writing, Book-keeping, Telegraphy, Penmanship, Drawing, all the English branches, and everything pertaining to business for six full months. We have sixteen teachers, and give individual instruction to all our pupils. Our school has its graduates in every part of the State. SEND FOR CIRCULAR. E. P. HEALD, President. C. S. HALEY, Secretary.

LESSONS BY CORRESPONDENCE

IN THE COMPLETE THEORY OF COAL AND METAL MINING.

INCLUDING Arithmetic, Algebraic Signs, Mine Ventilation, Mechanics, Mine Surveying and Mechanical Drawing.

Students are Qualified TO Pass any of the State Examinations. Pupils Study at Home. LOSE NO TIME FROM WORK No Text-Books Needed. Tuition Charge Within the Means of All. For Free Pamphlet and full particulars, address

The Colliery Engineer School of Mines,

Scranton, Pa. Sample copies of "THE COLLIERY ENGINEER," (by reading which hundreds of miners have qualified themselves to become Superintendents and Foremen), and catalogue of Mining Books sent free on application.

Assessment Notices.

OCCIDENTAL CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California; location of works, Silver Star Mining district, St. Mary county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 8th day of April, 1892, an assessment (No. 10) of Twenty-five cents (25c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 300 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of May, 1892, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 31st day of May, 1892, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors.

ALFRED K. DUBROW, Secretary.
Office—Room No. 69 Nevada Block, No. 300 Montgomery St., San Francisco, California.

DELINQUENT SALE NOTICE.

KEYSTONE CONSOLIDATED MINING COMPANY.
Location of principal place of business, San Francisco, California. Location of Works, Amador City, Amador county, California.

Notice—The e are delinquent upon the following described stock, on account of Assessment (No. 2) levied on the 9th day of March, 1892, the several amounts set opposite the names of the respective shareholders, as follows:

NAMES.	No. Cert.	Shares.	Amt.
A. B. McCreary	8	2,334	\$5,835 00
A. B. McCreary	50	134	335 00
A. B. McCreary	57	533	1,332 50
A. B. McCreary	59	99	247 50
A. B. McCreary	114	100	250 00
John Clement	103	134	335 00
M. J. McDonald	129	200	500 00
M. J. McDonald	137	500	1,250 00
E. D. Rue, Trustee	138	925	2,312 50
Wm. Letts Oliver	133	40	100 00

And in accordance with law, and an order of the Board of Directors, made on the 8th day of March, 1892, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, No. 310 Pine St., room 43, San Francisco, California on MONDAY, the 9th day of May, 1892, at the hour of 12 o'clock M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

J. H. ISHAM, Secretary.
Office, No. 310 Pine St., room 43, San Francisco, Cal.

F. A. HUNTINGTON,

— MANUFACTURER AND DEALER IN —

MINING MACHINERY.

HUNTINGTON'S IMPROVED ROCK-BREAKER.

The Main Features of this Machine are Strength, Ease of Adjustment, and Simplicity of Construction.

The movable jaw A is worked by the eccentric B and is pivoted at the bottom. The stationary jaw D is secured at the top by a bolt running through it, and at the bottom bears against the heavy bolt C. The main wear is, of course, at the bottom of a breaker of this form, and the wear is easily taken up by inserting a plate between the bolt C and the jaw D. The jaw is thus swung in at the bottom, and the opening where the ore passes through is made correspondingly smaller. As will be seen by the cut, this machine is of very simple construction and is strong and durable.

HUNTINGTON'S PATENT ORE FEEDER.

This Feeder is especially designed to feed the Huntington Roller Quartz Mills; it is simple in construction, and while in motion can be easily adjusted to feed fast or slow; it has but few wearing parts and its positive movement makes it the best Ore Feeder now in use.

F. A. HUNTINGTON'S CENTRIFUGAL ROLLER QUARTZ MILL.

The Following will Explain the Above Cut:

The ore and water being fed into the mill at the hopper A, the rotating rollers and scrapers throw the ore against the ring die, where it is crushed to any desired fineness by the centrifugal force of the rollers as they roll over it.

The water and pulverized ore are thrown against and through the screens when fine enough. The discharge is so perfect that it makes little or no slimes, and leaves the pulp in good condition for concentration. The rollers are suspended, leaving a space of one inch between them and the bottom of the mill, thus allowing them to pass freely over the quicksilver and amalgam without grinding it or throwing it from the mill, while it agitates it sufficiently to make amalgamation perfect. For wet-crushing and gold saving it has no equal.

I CLAIM ESPECIAL MERIT IN THAT FEATURE OF THIS SYSTEM WHICH PREVENTS ALL FLOWING OF GOLD AND QUICKSILVER, and the consequent loss of gold that attends stamp-milling.

For the economical working of ore that contains sulphurets, I particularly claim the adaption of this mill. The rotary method of crushing the ore so granulates the pulp (which is discharged the moment it is crushed) that a complete concentration of sulphurets is rendered most easy.

F. A. HUNTINGTON'S PATENT SHINGLE MACHINE.

This machine is so well and favorably known by all the principal lumbermen on the Pacific Coast that it is useless to go into any detailed account of its merits; suffice it to say that recent improvements in a new, quick return feed-works has placed it far ahead of all competitors. Send for Circulars.

The Gates Combination Crusher and Pulverizer.

The accompanying cut represents a combination crusher and pulverizer recently perfected by the Gates Iron Works of Chicago. The principle is the same as that of their regular form of crusher so well known over the country. There has been added, however, a movable or reciprocating concave, which allows the vibrating crushing cone to come in close contact with it, causing all the material to be crushed very fine before being discharged. The reciprocating portion of the concave is made in a solid ring, smaller than the inside diameter of the shell or outside casing. This is done to allow the concave to yield slightly to the motion of the crushing cone or head, the necessary resistance to crush the material as the head vibrates, being afforded by eight powerful springs which project through the outside casing or shell and meet the movable concaves, forming a resistance or backing of many tons. This resistance can be increased or diminished by setting up the screws which compress the springs, and which is done from the outside.

This machine has three feed openings, and will receive three pieces of ore 6 x 10 inches, reducing the material so that the largest piece will pass a half-inch hole. Twenty-five per cent of this product will pass a 30 mesh screen provided for the purpose, while the coarse or remaining 75 per cent passes over the screen and drops into an elevator, which carries it up and shoots it back into the crusher along with the large material which is being constantly fed into the machine, the result being that this fine material is again subjected to the crushing process, to be sifted out and the operation repeated so long as the machine runs and is supplied with new material.

By this means the entire product of any ore can be pulverized fine enough to pass through a 30 mesh screen which in some cases is fine enough for concentration. Where a finer product is required, it can be obtained by rolls or some other pulverizing machinery at comparatively small cost. This machine is no experiment, its utility having been demonstrated in practical working in many instances. The new mill of the Bunker Hill & Sullivan Co., in Idaho, is equipped with several of these crushers and they indorse them most highly. Several mills are also adopting them in Colorado and Montana.

This is believed to be one of the most important improvements yet made in the line of crushing machinery adapted to and greatly facilitating the reduction of all classes of ores. This machine weighs 12,000 lbs., with screen, elevator and frame, 15,000 lbs., and its capacity is, through 30

mesh screen, 18 to 20 tons per 24 hours; through 20 mesh screen, 25 to 30 tons per 24 hours; through 10 mesh screen, 35 to 40 tons per 24 hours. The Pelton Water Wheel Co., of this city, are the general agents of the Gates Iron Works, from whom full information can be obtained.

CHARLES ELLIOTT, Superintendent of the Spring Valley Water Works of this city, died suddenly at his home on Wednesday afternoon. Mr. Elliott has been actively identified with the Spring Valley Company as its engineer and superintendent since its organization, and before that was engineer of the old San Francisco Water Company. He is said to have been the first person to learn the machinist's trade in this city, beginning work at the Pacific Iron Works. In 1850 he was engaged erecting quartz

THE GATES COMBINATION CRUSHER AND PULVERIZER FOR ORES.

mills in Butte county. In 1859 he came back here, and has been connected with the water companies ever since. He was one of the oldest members of the Mechanics Institute, and for some years a member of the Board of Directors. Mr. Elliott was a popular man and had a very large circle of friends.

SAPPHIRES AND RUBIES.—Spratt Bros.'s sapphire ground near Helena, Mont., has been sold to the Sapphire and Ruby Company of Montana, an English company, for \$2,000,000. The land sold embraces 8000 acres on both sides of the Missouri river, reaching nearly fifteen miles along its banks. In addition the company has secured all water rights in the districts.

CONNECTIONS were made in this city this week with the shore end of the new submarine cable of the Pacific Telephone and Telegraph Company, which was lately laid to Goat Island and from there to Oakland.

A New Mill for Mexico.

A fine, first-class 30-stamp mill is being erected in the San Luis mine at Guanacevi, Durango, Mexico, for the owners, J. B. Haggin and others of this city. A wire-rope tramway over a mile long will convey the ore from mine to mill. White-Howell furnaces are to be used in connection with the mill.

This is an old mine formerly owned by English people. The ore carries silver and gold and some of it is very rich, running as high as \$1,000 per ton. There is at this time enough ore out to keep the mill running two years, and it will average from \$50 to \$70 per ton.

In order to take this new machinery to the mine a road costing some \$30,000 had to be built. From the railroad station at Jemenez

Treatment of Tailings.

The Standard mill at Bodie produces an abnormal quantity of slimes on account of the large amount of clay accompanying the quartz on the ledges. In the mill, for the treatment of tailings, are six pans and three settlers, fitted up for the Boss continuous system, and one pointed settler-box. The pan capacity was found to be too limited, and two pans were added to the line, and another settling-box put on to take the overflow from the first, in which too much material escaped. There is still found to be some loss in slimes, in the overflow from the second box, but this it is impossible to avoid and retain the proper consistency of pulp in the pans.

From test runs it has been ascertained that basing the bullion by the use of salt and bluestone on quality, does not increase the extraction, and the proper slight amount of chemicals necessary was determined; the tests also showing that much grinding in the pans was to be avoided.

Since these tests they have steadily improved the work on the tailings, obtaining a product of \$1.90 per ton treated in October; \$1.50 in November; \$2.24 in December and \$2.26 in January, being an extraction of 35 per cent at an average cost for the months named, of 88 cents per ton.

The average of several chlorination tests on the raw tailings shows but 8 per cent higher extraction than the continuous pan system.

Manager Thomas H. Leggett states in his report, that most probably, roasting with sulphur and salt by either the Plattner or harrel process, would give a much higher percentage of extraction, but with wood, at Bodie, costing \$10 per cord, laborers wages, \$3.50 per day, and freight rates three and four cents per pound

(the latter necessary to take into consideration on account of the chemicals essential for either process) it would be impossible to figure a profit on tailings of \$7.50 per ton.

Mr. Leggett sent a large sample lot of tailings to the Denver Gold and Silver Extraction Co. (MacArthur-Forrest or cyanide process) for trial, in the hope of obtaining a method giving a higher extraction without roasting or other great expense. The cyanide process results, after 12 hours agitation in a one-half per cent solution, were but 46 per cent extraction. This is but 12 per cent better than the present cheap pan process; a margin that would be more than swallowed up by the cost of the process and the expense of the reagent.

On 100 pounds of concentrates sent, worth \$86 per ton, their test of 12 hours agitation in a one per cent solution, gave 88 per cent extraction, or nine per cent in excess of that obtained by pan amalgamation, which would scarcely cover the cost of the cyanide.

THE Ocopah volcanoes in Lower California, are said to be again in eruption. This report confirms the previous accounts from the Lower California volcano region, that whenever heavy earthquakes occurred on the Pacific Coast these volcanoes became disturbed and their activity greatly increased.

EDWIN P. MARCELLUS, Secretary of the Pioneer Association of California, died suddenly this week. Like most pioneers, he was at one time engaged in mining, but of late years has resided in San Francisco. He was for some years United States Marshal here.

CORRESPONDENCE.

Lixiviation of Gold Ores.

The MacArthur-Forrest Process.

SAN FRANCISCO, April 20, 1892.

TO THE EDITOR:—I have just returned from Calumet, in Shasta County, where I went on the kind invitation of my friend, Mr. Almarin B. Paul, to study the practical details of the MacArthur-Forrest process.

After having waited several weeks for the weather to become settled, I unfortunately arrived at the works at the moment when the heaviest storm of the season was impending. I found Mr. Paul a very busy gentleman, yet finding time for kind and courteous attentions to me, albeit somewhat annoyed by the unexpected turn of events in the weather department, which prevented bringing ore to his mill and otherwise interfered with his pursuit of happiness.

The battery was in operation only a few hours during my visit, but some of the percolators, or lixiviating vats, were full, and the pactolean stream was flowing steadily to deposit its precious burden, under the soft persuasion of chemical affinity, and return for another load. In this part of the process there is no noise, no hurry, no chance for the precious particles to slip away and go mocking down into the river bed; securely trapped and under absolute control, resist as they may, it is only a question of time when they must yield to fate and, with the brand of the American eagle upon them, become the slaves of the world's tyrant, man.

Australia, once the land of the convict slave, has taught free America to vote—beneficent irony of fate—also to skim the waters in the fragile "shell." It is not quite certain that the Cornstalk cannot give the American points in the noble art of self-defense. The New Zealander, not Macaulay's, has made the first triumphant advance in the practical solution of the land question—Auckland has partially adopted the "single tax," and the Premier reports the most encouraging results—and at last the Briton, after many failures, has given us a really good process for the extraction of precious metals from our ores, and, as a born Briton, I rejoice therein.

Yet, "America leads the world," if not always in invention, at least in the facility with which she assimilates a good thing, from whatever source it may come, and the energy with which she goes to work to develop all of its possibilities. The American naturalizes the Australian ballot, the Australian pugilist, the gum tree, the ladybird. He frankly adopts the English sparrow, and as frankly damns him afterward; and yet the poor sparrow is only doing what the English pilgrims did—driving out the natives.

In the matter of the land question, he will do as my friend Wilson, a typical American, did in Honduras when we had to cross a raging torrent. He just let all the rest of us get variously wet, from boot top to waist, and then, having made his notes of the course, mounted with his feet on the saddle and quietly rode through dryshod.

All imported benefits, including Irishmen, grow so much bigger and better on American soil that they soon become American, and I expect it will be so with the MacArthur-Forrest process.

Almarin B. Paul is a typical American, hence nothing if not progressive. He has already made a stride in advance, which, if it does not necessitate a countermarch of equal extent, will greatly facilitate the operation of the process. In the Calumet mill the necessary lime or alkali is put into the cyanide solution, and that is used in the wet-crushing battery whence it flows with the pulp to the percolators.

Of course the liquid does not percolate as rapidly as it flows into the vat, hence the overflow is conducted by iron pipe to a sump, whence it is raised by a centrifugal pump of a kind which can swallow a little grit without gagging, and returned to the battery. When one vat is sufficiently charged with ore, the stream is turned into another, and the first is left to percolate, the liquid being "circulated," or repassed, several times before going to the precipitating box, where the dissolved precious metal is deposited on zinc shavings.

This arrangement has manifest advantages; it has also, from a theoretical point of view, defects, the importance of which can only be determined by experience. Mr. Paul has nearly completed another mill, not far from the Calumet, in which the ore will be crushed dry. This will enable him to make the necessary comparisons in that respect.

I doubt if it will do, in all cases, to add the alkali to the cyanide solution, and there

may be instances in which rather coarse crushing and percolation will be advantageously replaced by fine crushing, agitation and the filter-press. Also, I have an idea that electrolysis will be applied to the precipitation of the gold and silver. I do not suppose that the process will be applicable to all ores, nor that it will be applied in the same manner to all those which can be treated successfully by it. In short, I discern in it a wide field for study, practical and scientific, having already encountered some chemical puzzles.

This letter is not intended to be either formal or final. I believe the process to be of immense importance, even in its present stage of development, and I propose to return to Calumet when both of the mills are in operation, and make such investigations as will enable me to take the responsibility of positive statements of results, and Mr. Paul is willing for me to do so.

Moreover, I intend to make a specialty of this process, so convinced am I of its value. It is not difficult for me to believe in it because, in the first place, I believe Mr. Paul's statements of results, and, in the second place, I was aware of the main facts before the process was patented. Why I did not discover the practical applicability of those facts is "one of those things that no feller can find out" perhaps. Was it destiny or stupidity? In either case it was my kismet.

C. H. AARON.

The Prospector and the Sheepman.

KERNVILLE, April 23, 1892.

TO THE EDITOR:—There are but few changes to note in the mining outlook in this section. Some of the claims of the Sumner Mining Co. have recently been let to Mexicans for the purpose of having small bodies of surface rock worked on tribute; and this has given occasional employment to one or two batteries of the great 80 stamp mill of that company, which for the last nine years have otherwise remained idle. A little prospecting still continues in the region of the old town of Keyville, and five or six arrastres are occasionally seen running, as well as J. W. Sumner's mill on the old Mammoth lode.

The great curse of the mining prospector, however, is the ubiquitous sheepman. He hails from that portion of France bordering the Basque provinces, is unable to speak English, does not vote, pay taxes or have a home, drives his sheep everywhere that the plats show government land, and burns all thickets and dead timber behind him. Thirty-five thousand of these sheep pass up the south fork of Kern river every year, while I am told that taxes are only paid on 80,000 in Kern county, and nearly all of these in the hands of citizens who have a home. These roving bands come as a blight upon the country worse than Pharaoh's locusts. Even on deeded land they will lay waste a half mile in width if the owner is not constantly on his guard; and as for the prospector finding a bite of grass in the mountains for his donkey, the thing is an impossibility. The pack animals belonging with the band are grazed on a little patch near camp from which the sheep are herded; all else is laid waste. The native grasses being thus exterminated in the mountain meadows, the melting snow gutters out the soil to the bedrock, and at this season of the year the south fork runs as turbid as if a thousand mines were dumping the debris from their placers in the stream, whereas, in fact, there is not a home or laboring man in all that portion of Tulare county drained by this river, embracing perhaps 30 townships. Still, all the region I have referred to is but a highway to broader fields of conquest and desolation on the main Kern and on the desert to the east. Before the advent of the railroad or wagon road, many good mines were opened to the east, but abandoned on account of the extravagant cost of freighting from Visalia and Stockton; but now it is very difficult to relocate the scene of former operations, because the locality is, in very fact, desert and uninhabited.

From the summit of Piute mountains southward and eastward through Agua Caliente, Jaw Bone canyon and Red Rock, there is as fine a country for prospecting for the precious metals as there is on this coast; but there must first be wagon roads for the delivery of forage. The donkey will not survive after sheep. Respectfully,

STEPHEN BARTON.

FREEZING SHAFTS.—The Poestch refrigerating process for shaft-sinking is coming into greater application in France. The Lens and Marles colliery owners are using the method with it, it is stated, very satisfactorily results. In the Nord coal basin there are at present 13 new shafts in process of sinking.

Mock Gold.

On an Interesting Microscopical Specimen of Limonite in the Form of "Mock Gold," from Nevada.

A paper read before the San Francisco Microscopical Society, April 6th, by HENRY G. HANES, F. G. S.

Mr. J. T. Bradley of this city, returning from a recent visit to Nevada, brought with him from Bald mountain, White Pine county, a curious and rare mineral specimen, to which he has called my attention.

At first glance it would seem to be a ferruginous rock very rich in visible gold, but there is an indescribable difference in the appearance of the yellow mineral which leads the experienced miner to distrust his first impression.

When placed under the microscope, the true nature of this singular specimen is immediately revealed; the mass is then seen to resemble botryoidal limonite—presumably a pseudomorph after pyrite—mixed with hyaline quartz.

The foundation mineral, when magnified, resembles that variety of cassiterite known as "toad's-eye tin." Overlying this is the mock gold, in the form of an incrustation, deposited no doubt by the action of water.

In making the first microscopical examination, while testing the malleability of the illusive incrustation with the point of a pen-knife, I was surprised and interested to see the reflection of the blade from many spherical faces, proving that the surface of the mineral has a lustre quite equal to that of polished speculum metal.

It was my first impression that it was pyrite in its concretionary or radiated form, but I found it more brittle, and when broken from the mass and examined with a two-thirds objective, it did not show the striated characteristics of that mineral.

Blowpipe and microchemical reactions seem to prove conclusively that the mineral is really limonite, as first supposed. The streak is golden, ochery yellow; almost orange. In a closed glass tube it yields water, changes to a dark red color and becomes magnetic. The calcined mineral rubbed in an agate mortar yields a bright blood red powder; this dissolved in hydrochloric acid gives a yellow liquid which becomes deep red on adding sulphocyanide of ammonium. It therefore seems to be hydrated sesquioxide of iron (limonite) in a form peculiar and rare.

A discovery has recently been made in a cave in Iron mountain, Shasta county, of a stalactitic and stalagmitic limonite, having a copper-colored metallic tarnish; but, although the copper red predominates, small points and minute areas of the same bright gold-colored mineral under consideration may be plainly seen under the microscope.

The specific gravity of limonite being only 3.6 to 4, it will not remain in a pan or horn spoon, as gold does in washing.

About 26 years ago, another mock gold mineral caused considerable excitement, followed by disappointment, in Owen's valley, Inyo county. A new district was discovered with really rich gold quartz veins. When a portion of the vein matter was pulverized and washed in a horn spoon, the prospect obtained was unusually large; a considerable portion was really gold, but the greater part was a heavy yellow mineral which would not wash away, but which refused to amalgamate. It was some time before the miners would believe it was not gold in some peculiar condition. A blowpipe examination I made of it at the time showed it to be a lead mineral, probably wulfenite (molybdate of lead).

Some years since, a bronze-like, pulverulent mineral of a golden color and appearance, was brought to San Francisco from Pioche, Nevada; it was microcrystallized in minute hexagonal plates. At the time it was thought to be a rare form of limonite, but as that mineral is unknown in crystals, it was probably a mistake. It was a very beautiful microscopical object.

In Black canyon, Owen's valley, Inyo county, in the croppings of the Ida mine, the black rocks have a similar tarnish, and, strangely, there are minute octahedral crystals of genuine gold on the surface; they are wholly superficial, and their attachment to the rocks in isolated crystals still remains to be explained.

These minerals are very interesting, and with the exception of the last mentioned, I have brought them all for your inspection this evening.

A GERMAN PAPER states that Messrs. Siemens & Halske of Berlin have succeeded in producing a new telephone cable which the Bavarian telegraph authorities consider as an important advance for the introduction of the double wire system. The cable is suitable for long-distance telephony.

American Society of Mechanical Engineers.

San Francisco Meeting, May 16, 1892.

The American Society of Mechanical Engineers is one of the largest technical associations in this country, and has among its members many persons of international reputation. The objects of this Society are to promote the arts and sciences connected with engineering and mechanical construction, by means of meetings for social intercourse and the reading and discussion of professional papers.

To be eligible as a member, a candidate must have been so connected with certain professions as to be considered, in the opinion of the council, competent to take charge of work in his department, either as a designer or constructor, or else he must have been connected with the same as a teacher.

Mechanical, civil, military, mining, metallurgical and naval engineers, and architects of eminence, are to be found enrolled in the list of, and are, eligible as members. All the technical schools and colleges of the United States and Europe, where the sciences and arts are taught, are as a stepping stone to membership in this society. Our State University at Berkeley and the Leland Stanford Junior University of Palo Alto are now paving the way for California's best sons to membership.

From this it will be seen that these mechanical engineers, who propose crossing the continent to hold their spring session in the Academy of Sciences building in this city, are not merely people who can run a locomotive or construct a stationary engine, but they are skilled professional men of all arts, equipped to design or construct all great engineering works. Chas. H. Loring, its present president, was chief engineer of the North Atlantic blockading squadron during the first 18 months of the Rebellion, and participated in the famous battle between the Monitor and Merrimac, and the honored and lamented Ericsson, who designed that Monitor, was a member.

In the summer of 1889, this Society chartered the steamer City of Richmond and crossed the "pond" to visit their professional brethren in England, France and Germany. In London the party was formally received at the house of the Institution of Civil Engineers by the president, council and members. On the evening of the same day the Lord Mayor, Aldermen and Court of Common Council of the City of London tendered them Guild Hall, where they were banqueted. This in itself was an exceptional honor. In gracious response to application to the Queen, Her Majesty directed that special facilities should be afforded for visitors to Windsor Castle, including the private apartments, and to St. James and Buckingham Palaces. The Archbishop of Canterbury personally showed and explained the objects of interest at Lambeth Palace, while the Dean of Westminster delivered, in the Abbey, an address on the historical associations of that building.

Among the purely social entertainments offered were a garden party by the Baroness Burdett-Coutts; a reception by Lord Brassey, K. C. B., Associate Member Institute of Civil Engineers; and a dramatic performance in the grounds of Copp'd Hall, by invitation of Mr. S. B. Bolton, Associate Member Institute of Civil Engineers, while those having facilities for doing so vied with one another in their efforts to afford the visitors amusement and recreation during the six days of their stay in London. Special trains were granted by the principal railway companies to various places of engineering interest in and around London.

The trip of the Society to California takes somewhat after their trip to Europe. They will leave New York on Wednesday, May 4th, in special Pullman trains, visiting places of interest en route. Will arrive at Sacramento May 13th, where the afternoon will be spent; thence to Monterey, where they will remain at the Hotel del Monte over Sunday, arriving at the Palace Hotel, San Francisco, Monday, May 16th, upon which day their first meeting session will be held at the Academy of Sciences building.

Their stay in San Francisco as an organized body will extend to May 19th, during which time many valuable papers will be read and discussed, and municipal courtesies extended to them, as well as private entertainments, and visits to engineering works and other places of interest near our city.

A large local committee has been selected to assist in the entertainment of the distinguished visitors.

CHAS. G. YALE,
W. R. ECKART, Sec. of Local Com.
Chairman. 220 Market St., S. F.

Mexican Mines.

English and American Mining Company Failures.

The mining industry is the most important of all the industries in this country, says the Guaymas *El Trafico*, for all that it is the least protected. It is the mainstay of and affords the chief maintenance to all the other industries here, and it is therefore the duty of every one, and especially of us miners, to defend it, to bring to light the causes of the existing discredit from which the mining interests of Mexico suffer abroad and to stimulate, with all legitimate means at our command, the formation of companies for the exploration and development of our mines.

In order to encourage and attain the introduction of foreign capital, it is absolutely necessary to inspire foreign capitalists with such confidence as will convince them that they are afforded complete guarantee and protection in their enterprises; and in this respect there is hardly anything more to be desired, inasmuch as the Government of Mexico has at all times extended its full protection to foreign mining companies to the best of its ability, even in revolutionary times, as long as the representatives of such mining properties and interests have not meddled with the political matters and parties of our Republic.

The foreign capitalists have no longer any doubt as to the willingness of this Government to protect and assist foreign mining enterprises among us, but, unfortunately, the protection of the Government is not the only factor to be considered in the success of these enterprises, inasmuch as they frequently fail through causes which I shall briefly indicate, and the remedy of which lies within the reach of the interested parties.

The principal cause of failure with the foreign mining companies consists, in my opinion, in their lack of good judgment and knowledge when they select their superintendents, agents or managers in Mexico. In a great many cases managers are appointed who are not only no mining engineers, but who hardly know what a mine really is, and who very seldom possess practical business knowledge. I have myself known some that could not write their own language properly. Being incompetent themselves, it is readily understood that they lack the discernment necessary for the selection of such employees as might in a measure supply their own want of capacity. Confident in their own ignorance, they appoint for their assistants persons as ignorant as themselves, persons who are willing enough to undertake the work for the sake of the salary only, without taking the least interest in the outcome of the enterprise which in this play of "blind leading the blind" cannot fail to be disastrous. I have known cases of this kind where the necessary supplies of the mines were paid for at the rate of five times the actual market value.

And again there are cases where the superintendents exact and accept a certain commission from the merchant who furnishes the machinery, tools, supplies, etc., for the enterprise under their charge.

But even supposing that the greater part of the boards of directors of the foreign mining companies be of undoubted honesty, yet the proceedings of their meetings are quite frequently conducted with great flippancy which can only be explained by the fact or supposition that they have very little knowledge of the business in hand. It is not necessary to specify cases. I will only here allude to the weakness displayed by many of these foreign boards of mining directors who appoint agents, managers or superintendents to these important positions for the simple reason that they present themselves provided with a letter of recommendation from a mercantile house or perhaps a shareholder. It would appear that nowadays such recommendations are accepted as a matter of course, none of the board mustering the necessary energy to propose that the fact of the recommended person's possessing the stated qualifications be ascertained beyond a doubt; hence it follows that the superintendent thus selected, when he arrives at the mine, does not work for the best interest of the shareholders, but simply for the benefit or according to the whim of those who recommended him, and very frequently with the intention of gambling, with their knowledge and consent, in the rise and fall of the shares.

If, together with all this, the said appointee is no miner, it can easily be foreseen what will be the end of the business.

Such imprudent appointments have given rise to the belief that there are no skillful miners or capable engineers in those countries; but such is not the case, for we have here examples of mines whose owners live

abroad, which are managed by foreigners and give splendid results; but, unfortunately, we must admit that these mines belong to the minority.

It would also be well if the Secretary of the Interior would publish all the well accredited data obtainable as to mines and mining matters, so that the shareholders residing abroad might be enabled to inform themselves upon the true state of their mines and might compare these official reports with those obtained from their directors.

If by the means here indicated I may succeed in strengthening the confidence of the shareholders of foreign mining companies and better the results of their investment, I shall have the satisfaction of having contributed something toward the benefit of the mining industry, which is the one that advances most the prosperity of the country.

Evolution of Inventions.

A new departure will be made by the patent office at the World's Fair at Chicago. Hitherto it has never attempted to go beyond an exhibition of photographs and drawings. In this instance it will offer an elaborate and comprehensive display of models. The show will be designed to illustrate as completely and vividly as possible the age of mechanical civilization. It will give in concrete form a picture of the progress of invention.

The Commissioner of Patents says that the great exhibit of the patent office will not be displayed. All that will be attempted in the show proper of his bureau will be to illustrate the processes through which those achievements have been perfected. For this purpose, groups of models will be prepared. For example, one group will represent the progress of the steam engine, beginning with the first one, which was built 150 years before Christ, by a Greek named Hero. It had a boiler, and was able to do work by means of a shaft and belt attachment. From this primitive contrivance to the modern Corliss engine, in miniature, an interesting series will extend.

Other groups will be similarly arranged. One will represent the printing press, all the way from Gutenberg's original invention to the rotary Hoe machine, which turns out newspapers at the rate of many thousands per hour and folds them ready for delivery. In electricity, wonders of all sorts will be illustrated by progressive series. There will be telephones running all the way from the primitive conception to the perfected instrument now in use. The telegraph will be introduced with the actual instrument made by Morse, by which the first experimental messages were sent over the wire from Washington to Baltimore, this line of discovery culminating with the latest devices for printing messages at any distance with type and transmitting one's own handwriting across thousands of miles of space in a fraction of a second. The growth of the locomotive will be shown in like manner; also that of the sewing machine; of the marvelous modern agricultural implements from primitive types; of clocks, from the water clock of ancient Babylon and the later hour-glass, etc.

Many of the models required for these groups are already in the possession of the Patent Office, but a large number will have to be constructed especially for the purpose. Manufacturers all over the country will be asked to supply specimens of their products for representing the latest developments of inventive art. The locomotive works will be requested to lend miniature models of their newest engines. Makers of agricultural tools and sewing machines will contribute the most improved specimens of their handiwork. Likewise with printing presses and everything else. Few, if any, of the mechanical models will be set working, however.—Washington Star.

TO SUPPLANT STAMPS.—The Cave Springs mine, near Clifton, Deep Creek country, is to be provided with machinery at once. There are to be five machines for working the ore, each with a capacity of ten tons of ore per day. These machines are being made in Chicago and it is expected they will be in operation by the middle or last of June. The process is that of first crushing in rock breakers, and then the ore goes to these machines, which pulverize it by means of iron or steel balls running in a channel, and propelled by an upper disc resting on the balls. The process is amalgamation under water pressure, the quicksilver being below the grinders, while the pressure of water passing through carries off the waste and thus keeps only clean ore to be pulped by the crushers. The water pressure regulates the fineness without the use of screens. Some of this ore was tested

by one of these machines with exceedingly satisfactory results. Ore that sampled \$107 per ton in gold was worked up to \$103 in this test. The machine is the same as the one lately put into the Stewart No. 2 mill at Bingham.—S. L. Tribune.

Granitic Rocks.

The rocks of this group are characterized by a coarse grained, speckled or mottled appearance, arising from the fact that they are formed by the aggregation of distinct crystals or masses of different colors. Granite, which is the type of this group, consists of quartz, feldspar and mica. Sometimes the mica is wanting, and the quartz is in the form of curiously bent laminae, which on cross-section resemble Hebrew or Arabic characters, disseminated in a mass of feldspar. The rock is then called *graphic granite*; when the mica is replaced by hornblende, the rock is called *syenite*; when, in addition to the quartz and feldspar, both mica and hornblende occur, it is called *syenitic granite*. Most of the granite in this country is syenitic. The dark specks in granite are due to mica or hornblende; the opaque white, or reddish, or greenish, with distinct cleavage, is feldspar, and the grayish glassy is quartz.

Quartz is pure silica or silicic acid (SiO_2). Feldspar of this group is an acid silicate of alumina and alkali, potash or soda (orthoclase). Hornblende is a basic silicate of magnesia and lime, with also oxide of iron and alumina. Remembering also that hornblende is a black mineral, while quartz and feldspar are either colorless or very light colored, it is evident that this group may be divided into two subgroups, the one more acid and the other more basic; and in proportion as quartz and feldspar predominate, the rock is lighter colored, less dense and more acid; in proportion as hornblende predominates, it is darker, heavier and more basic. Granite may be taken as the type of the more acid subgroup, and the darker varieties of syenite as the type of the more basic subgroup. These subgroups graduate insensibly into each other. Since a general characteristic of the granite group is the existence of free quartz in notable quantity, this group, taken as a whole, is usually regarded as more acid than the other two groups.

Granitic rocks commonly occur forming the *axes and peaks* of mountain chains, or as *rounded masses* of greater or less extent, coming up through stratified rocks of the older series. They also sometimes occur as tortuous veins, running from an underlying mass into the stratified rocks above, as if forced by heavy pressure, while in a fused condition, into small, irregular fissures of the overlying strata, and sometimes, though rarely, as dykes filling great fissures, as in the elvans of Cornwall; but it is doubtful whether these should be considered as true granites. They are probably a quartz porphyry.

We have no distinct evidence that granite is ever an eruptive rock, *i. e.*, that it has ever been forced upward through great fissures of the earth's crust, and outpoured on the surface in the manner of lavas and traps; hence also ashes, cinders, tufas or other evidences of contact of a fused mass with the atmosphere, have never been found in connection with granites. Most geologists, therefore, believe that the granite, although it may be eruptive or intrusive by pressure, as explained above, is never an eruptive rock. Granitic rocks are most probably formed at great depths, and remain where they are formed. Whenever, therefore, they appear on the surface, it is probable they have been exposed by extensive denudation.—Joseph Le Conte.

The Precious Metals.

Director of the Mint, Leach, in his report to Congress on the production of precious metals for the calendar year 1891, says the gold product of the mines of the United States aggregated 1,604,840 fine ounces, value \$33,175,000, an increase of \$330,000 over the previous year, which was largely due to improved processes of treatment and the increased amount of gold extracted from lead and copper ores. The silver product was 58,350,000 fine ounces, an increase of 3,830,000 ounces over the previous year. The commercial value was \$57,630,040, or a coining value in silver dollars of \$75,416,565. The increased silver product was due to new discoveries in Colorado and Idaho and to cheapening the process of the smelting lead and copper ores bearing silver. The total amount of paper and metallic money in circulation on January 1, 1892, exclusive of the amount in the treasury and its branches, was \$1,592,393,629, against \$1,528,594,627 on January 1, 1891, an in-

crease of \$63,799,002. The amount of paper and metallic money in actual circulation on April 1, 1892, was \$1,608,641,520. The product of gold and silver in the world for the calendar year 1891 was \$124,229,000 gold and \$139,175,000 silver. The product of gold increased in 1891 over the prior year nearly \$5,000,000, the increase being principally in South Africa. The product of silver increased in 1891 over the previous year about 8,000,000 fine ounces. The increase in the silver product was principally in the United States, Australia and Bolivia.

Putting Inventions on the Market.

The following good advice to patentees we copy from the *Manufacturers' Gazette* (Boston). We commend it to the attention of patentees generally, who are too apt to reject very good offers for their patents soon after their issue.

We have frequently been asked by inventors who have succeeded in producing small articles of more or less merit, and for which there appears to be a demand, what is the best method to pursue in order to put them on the market.

This is a question which has puzzled a great many, and especially those who with small means are unable to go into the manufacturing of their specialty on a large scale, without parting with a controlling interest in their patent to another party in order to raise the necessary capital with which to push the business, a transaction which many object to on account of the possible and probable consequences which often follow, viz., the loss not only of the patent right, but of all share in future business.

In nine cases out of ten it is far better for the inventor, and he will realize more from his invention to sell out entirely and turn his attention to some other business, or the production of a new patentable article. That is, in case he has no money with which to develop and place his invention in the market.

The only difficulty in this is that a majority of inventors set too high value upon their inventions. They think they have the world in their hands, and are disposed to hold on to it unless some one comes along who is foolish enough to pay an unreasonable price for the patent. This is where they are often mistaken, and it would be far better for them to accept a *bona fide* offer, even though it is but a fraction of their ideal value of the article.

The fact is that no invention, however valuable at the time it is produced or perfected, is sure of a monopoly or even a fair competing chance for a great while, and the sooner the inventor disposes of it, the better off he is. Thousands of inventions have been dead failures, and never returned to the inventor one dollar, simply because, thinking that he held a monopoly, and that the world was bound to him, he has held on to it, unable himself to put it upon the market and alike unwilling to allow any one else to do so for a reasonable consideration until some one else has come out with something equally good, and possibly an improvement, and he finds himself without a bidder, and another man making money which he might have had, had he used better judgment and good sense.

Another way in which a mistake is made is in starting out on too large a scale. If you have a really valuable patented article, there is very little difficulty about finding a market for it, if you are not too hasty. It is better to begin in a small way and gradually increase than to begin by forming a large stock company and beginning too large. We are speaking in reference to the inventor's interests. If he can get his goods manufactured so that he can handle them himself, even though in a small way at the start, if his invention is worth anything, he will soon be able to increase his business and can then hold control of it himself. As a rule, we are of the opinion that it is better to contract with some reliable firm for the manufacture of the article than to go to the expense of putting in the necessary machinery, etc., to do it for yourself. This is especially true in relation to the smaller articles.

By doing it in this way, you are saved the care and management of a shop, and have more time to devote to pushing the sale of the article, and the difference in the cost is very little—hardly sufficient to compensate for the possible saving.

It also gives you the use of the capital which would be required to fit up and maintain a shop, with which to push the business, and at a time when it is needed, too.

After the business has grown sufficiently large to warrant it, then there is time enough to put in a plant, and you will be better able to do so, and you will be in a position to know what is required.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

Amador.

PLYMOUTH CONSOLIDATED.—*Ledger*, April 23: Early this week, work on this property was brought to a standstill. A short time ago, a move was made to free the mine from water, and this gave birth to the hope that the deep levels of the mine were to be reopened and worked. All these expectations have been rudely dispelled by the entire cessation of work of every kind about the premises. What this means we are at a loss to know. Some look upon it as a freeze-out game. No one believes that it means the total abandonment of this famous mine, which paid handsome dividends right up to the time of the fire some years ago, and which has remained untouched in its lower levels ever since. The probability is that work has ceased, owing to the exhaustion of the surplus funds. By the last official report the cash on hand was very small, and must have been used up by the operations since January. The company, we believe, is not incorporated under the laws of California, and consequently the stock is not assessable the same as home organizations. The closing down has naturally had a discouraging effect upon Plymouth. Still, the mineral resources of that section, there is every reason to believe, will ultimately place the town on a prosperous footing, sooner or later.

MISCELLANEOUS.—Five stamps of the Amador Queen mill were started this week on the ore taken from the large pocket of metal met with lately. The ore carries lots of base metal, and whether it can be treated successfully by ordinary mill process is questionable. The Hardenberg mine at Middle Bar is reported to be looking exceedingly well. The ore shoot north of the shaft, in the lowest level, is eight feet wide, and of good average character. It is the regular ribbon rock formation, the quartz being identical with that of the Kennedy, Keystone, Pacific and other mines on the mother lode.

SUTTER CREEK.—*Cor Amador Ledger*, April 23: Taking out the water in the Hector mine is progressing favorably. They are down 135 feet now, and the skips are running well. James Opie, one of the most experienced miners in the county has charge of the shaft, repairing shaft and track as the water is lowered. The timbers are sound, and the shaft needs very little repairs, but the track is found to be a little shaky, and care has to be exercised to avoid accident.

PLYMOUTH.—The Pacific mine has shut down, most all the men being let off Sunday; the cause we are unable to state. Some of the miners think that it will not be long before it will start up in full blast again. They are keeping the water out until further orders from the company.

QUARTZ MOUNTAIN.—The developments made on the Gold Mountain Company's property have highly elated the superintendent and foreman. Mr. Farwell is not satisfied with the sheet or blanket of good paying ore that covers nearly 40 acres of the claim, and which varies from six inches to six feet in thickness. In prospecting, they have unearthed a vein that is running down at an angle of 60 or 65 degrees—something that surprises even the owners of the mine. Money and labor are not stinted. The tramway is progressing. The True Company are putting in two concentrators to compete with the Woodburys, with every requisite to give both an equal show.

Butte.

BANGOR.—*Cor. Oroville Mercury*, April 21: The mines here are paying a dividend and shipping virgin gold every week, which is conclusive evidence that those who possess the "Blue Lead" deposit have a sure thing.

Calaveras.

MURPHYS.—*Cor. Calaveras Citizen*, April 23: Geo. McCullom, superintendent of the Right Bower on Indian creek, was in town yesterday. He reports excellent progress in the tunnel, and has great faith in ultimate success. Over 3000 tons of quartz have been crushed from this mine that was of very high grade, and the wonder is, how capitalists passed it by. It is in good hands now—the Sheep Ranch combination—and developments will be pushed to a satisfactory conclusion. Eight hour shifts is the order in the tunnel. We predict this will be another dividend for Higgin & Co. Mr. Campbell is still pushing developments in the Washington on Indian creek. Some of the rich quartz, for which this mine is famous, is encountered in bunches in the tunnel as the drill cuts its way forward, but as yet no large bodies of quartz have been disclosed. On the Beatrice, one mile west of town, considerable progress has been made the past week. The indications are now favorable for striking the vein in a short time. The tunnel now being run is in over 300 feet, and will tap the vein at a depth of 200 feet. The Norfolk, on the eastern suburbs of town, still keeps up the full complement of men, and everything is working smoothly. Some exceedingly rich quartz is taken out of the mine.

OAE TO BE CRUSHED.—*Mt. Echo*, April 23: There are several mines in operation around Murphys having upon their dumps hundreds of tons of ore waiting to be crushed. We are informed by reliable parties that if some enterprising man would erect a five or ten stamp mill in the vicinity of Murphys, to do custom work, that he could get patronage enough to keep his mill running the year round.

PAID OFF.—All the indebtedness that was standing against the Brunner mine at Albany Flat has been paid off. The creditors have all got their money, and the property is again back into the hands of the original owner, Fred Brunner. Work will probably be resumed on

this mine shortly. It is the opinion of experienced mining men who have seen this mine that it is one of the best of mines in this locality.

Inyo.

A TIN STRIKE.—*Register*, April 23: Reports have been numerous of late concerning a rich strike of tin in Deep Spring valley. Investigation proves that there is some foundation for the rumors. No assays have been made as yet. But W. H. Uhlmeier of Big Pine, who is one of the parties interested, submitted specimens to State Mineralogist Irelan. The latter states that the ore contains metallic tin, a form so rare that its existence is questioned by many scientific men. The ledge is said to be immense, so it is hoped that the ore will prove to be something that will pay for working.

Los Angeles.

ACTON MINES.—*Acton Rooster*, April 23: Mr. John Roberts and wife and Mrs. Pierson are now from Los Angeles. Mr. Roberts is looking after his fine mining property up the Aliso canyon. Mr. E. Reckman has bought out the interest of the Padre mine, belonging to Mr. Griffith Johnston on Mt. Gleason, and will now push the wagon road for all it is worth, and also make other valuable improvements on Gleason. Some very fine specimens of quartz, such as have never before been seen, have been brought into our sanctum. This camp is going to heat every camp around this part of the country. Other rich mines and mining property are lying idle, awaiting the right man to take hold of them. We have no doubt but what this change is taking place now. Northern mining men are beginning to come here to look after our mining interests.

Mono.

THE BULWER CON.—*Bodie Miner*, April 23: The declaring of a ten cent dividend by the Bulwer last week is an important event in Bodie mining matters, and the friends of the district congratulate Supt. Kelly. The last dividend paid by this company was in 1884, and since then several assessments have been levied, the last of which was on October 28th. That after such a long period a dividend should again be declared, is significant, and refutes any statement that the camp is played out. There is no reason to doubt that the company will declare many more in the future. The work in the mine is progressing satisfactorily. A large quantity of ore is being accumulated, and prospecting continues.

SUMMIT.—The shaft is being cleaned out and retimbered as rapidly as possible, and this work will soon be completed. In the meantime, the extraction of ore goes on steadily.

THE BODIE CON.—The ore stops above 500 foot Jupiter shaft level continue to look about the same as last report. The rich ore in south drift, 700 Mono, is going down below our water level, so we have to start up our pumps night and day to lower the water to sink on it.

THE MONO.—The rich ore in stope, eight feet below the track in south drift 700, is going down below our water level. We have to start up our pumps night and day to lower the water and sink on it. The mill was kept running steadily.

Nevada.

MERRIMAC MINE.—*Grass Valley Union*, April 25: The work of cleaning out the main shaft of the Merrimac mine was completed yesterday, which reaches bottom at the depth of 300 feet. From there drifts are run, but to the distance they are in, or their condition, is not yet known, but this will be ascertained in a day or two. The shaft has been retimbered for 125 feet above the 300 level, and is now in excellent condition. A large ledge shows in the old workings of the mine so far as they have been opened, which produces ore of fair milling quality. If the ledge at the bottom is found to be as large as in the upper portion of the mine, even with rock yielding but \$6 or \$8 to the ton, it will be a paying proposition.

THE ONWAAD MINE.—*Grass Valley Telegraph*, April 23: The Onward mine is located near You Bet station, on the line of the narrow gauge railroad, and is owned by John M. Bufington of Nevada City, and others. The indications are that the ledge will soon be reached, as the contractors are making rapid progress. From prospects taken along the line of the croppings the company fully expect to soon find a paying ledge.

A MINE ATTACHED.—*Transcript*, April 21: J. B. Scully of San Francisco has attached the mining property of Tilton Bros. on Edwards' grade, for the sum of \$600, for a grocery and meat b.i.l. There are five claims in all, aggregating 7500 feet in length and 600 feet in width.

CHINESE REPLACED BY WHITE MEN.—*Nevada Herald*, April 23: We hear that the Chinese at the Union mine, Relief Hill, have all been discharged and white men employed in their stead. The Waukesha Co., also, have replaced the Chinese with white miners.

San Bernardino.

ANOTHER STRIKE.—*Needles Eye*, April 23: Word was brought into Needles last Monday that another big strike had been made in the Ibox camp, in a claim about one-fourth of a mile southeast of the Ibox shaft. The lucky man is a gentleman who has been working with Mr. Klinefelter for some time, and who is interested in the Cow Boy and other mines out there. When the *Eye* man was out at the Ibox camp, two weeks ago, he was shown this claim by the gentleman who owns it, but at that time not a lick of work had been done on it, and hence no note was made of the names, either of the location or of the party owning it. Captain Bethune, who is an old, experienced miner, visited the strike last Sunday, and he thinks the ore is richer than in the Ibox proper. There is no use in longer denying the fact that the Ibox country is full of gold, and shortly it will show itself up to be the finest mining camp in the West. The foothills in that locality have never yet been prospected, and there is a fine

opening there for some brilliant work. Miners and prospectors who mean business will do well to go out into that country and take up their locations and find out what they have, before hot weather comes.

Shasta.

NOTES.—*Redding Free Press*, April 23: Ore from the Ohio Company's mines, on Flat creek, is being gotten out, and hauling to the Shasta Company's mill will be commenced at once. The Shasta Gold Extraction Company's mill is now fully completed and will commence operations at once, working all ores by the MacArthur-Forrest process. Colonel Lyons of Old Diggings was in town this week, having been compelled to cease work on his tunnels by reason of the moist condition of the ground. He has done considerable work, however, since our visit to the mine, which he is developing in good shape. On account of the disagreements of partners and legal entanglements which have arisen, the reported sale of the Hidden Treasure mine, on Iron mountain, was not consummated when reported, but we understand that the difficulties standing in the way of a sale are being overcome, and that J. J. Kermeen will soon acquire possession. Mr. Rippetto arrived on the overland train Thursday morning. Since Mr. Rippetto's absence, at Salt Lake, he has been experimenting with the cyanide process, and has come to the conclusion that the ore of the Walker mine, at Old Diggings, can be successfully treated by it, and he proposes shortly to put in the plant necessary. The MacArthur-Forrest process, for the treatment of ores, is creating great interest among mining men, who are flocking to the Calumet works to see what can be seen and profit thereby. These works have been visited recently by Judge Spencer of San Francisco, Mr. Campbell of Yuba county, Chas. H. Aaron, a gentleman who has written several works on assaying and metallurgy, and C. H. Johnson of New York. These gentlemen were well paid for their visit.

SOUTH FORK.—*Courier*, April 23: W. H. Chynaweth visited the South Fork mines, near Igo, Wednesday, and came back very favorably impressed with the extent of the mineral wealth and possibilities of the section. Mr. C. is a practical and observing miner, who has followed the business for a lifetime, and informs us that, in his opinion, the South Fork is destined to be one of the very best mining camps in the county. The Black Prince mine, which he visited, owned by Robinson & Sons, is one of the most promising locations in the district. The upper wall of this mine is slate, and foot wall granite, a splendid indication of depth and permanence. The ore goes from 50 to 900 ounces of silver per ton. Streaks of pay ore between the walls are from 12 inches to 4 feet wide, and at the depth of 100 feet the vein shows every indication of richness and permanence. The mine has been bonded by an English company, whose time runs out in July, and if the new reduction works are completed and successfully work the ores, the chances are that they will take the property and invest a large amount of capital in it. Mr. Morley, who is putting up the works, says that, by his process, he can save from 90 to 97 per cent on ore. To send it to the Selby works costs ore producers \$36 per ton from the railroad. Mr. Morley proposes to work the ore by his process at a cost to the ore producers of 45 per cent, and guarantees to save 90 per cent, and if he can do so, the prosperity of the South Fork camp is assured. All the other mines in that locality are showing up well, and everybody out there is elated over the future prospects of South Fork.

Yuba.

AT SMARTSVILLE.—*Cor. Marysville Appeal*, April 23: The big strike in the Ayer mine at Mooney Flat continues to hold out and the boys have begun new drifts from the shaft in quest of other pockets which undoubtedly exist in that locality. The Wheaton mine at Mooney Flat, run by the arrastre and drift process, is worked by a party of young men and is upon a paying basis. The Blue Point mine at Smartsville is idle at present, as a portion of the old bank which started away during the hydraulic regime and which has been gradually seeking a lower level, came down during the stormy weather, carrying away the ditch which supplied the arrastres with water. Since then a force of men has been at work clearing and enlarging the old ditch. The work will be finished this week and after the new pipe has been laid, will be resumed. Patrick Campbell has erected a boarding-house for the men near the mine and everything will be in A 1 order when they begin again.

NEVADA.

Washoe District.

CONS. CAL. AND VIRGINIA.—*Chronicle*, April 23: There has been extracted from all parts of the mine during the week 1260 1410-2000 tons of ore, which were shipped to the Eureka mill. The average assay value of the ore worked at the Eureka mill during the week, 1405 tons, was \$19.21. Bullion shipped to the Carson Mint, assay value, \$54,748.17.

OPHR.—1465 level.—From the month of the north drift, from the drift run west from the winze 122 feet below the sill floor of the 1300 level, have continued our work in an easterly direction and extracted some ore therefrom. There have been raised to the surface during the week 21 tons of ore, the average assay value of which is \$18 per ton.

MEXICAN.—On the 1465 level the south drift from the crosscut running east from the bottom of the winze, 32 feet east from the winze, has been advanced 24 feet; total, 98 feet, continuing in porphyry and clay with quartz of low assay value.

UTAH.—The west drift from the shaft station, 340 level, has been extended a total length of 571 feet; face in vein porphyry showing fine lines of quartz and some clay.

SIERRA NEVADA.—The joint Sierra Nevada and

Union west drift from the shaft, 900 level, is extended a total distance west of shaft of 1868 feet; face in porphyry. The north drift from the Kenosha tunnel is advanced a total distance of 942 feet; face in porphyry.

UNION SHAFT.—The joint Sierra Nevada and Union west drift, 900 level, is extended a total distance west of shaft of 1868 feet; face in porphyry. The east crosscut, near south line from south lateral drift, 1570 feet west of shaft, 900 level, is extended a total length of 65 feet; face in porphyry and clay.

HALE & NORCAOSS.—On the 900 level upraise from east crosscut above this level, carried up during the week 15 feet; total height, 35 feet. Extracting fair grade ore from this upraise. Winze from this level sunk 15 feet; total depth, 50 feet; bottom in quartz yielding low assays. Hoisted from this level during the week 36 cars of ore, 1100 level.—An east crosscut started about 50 feet north and west of the shaft is advanced 35 feet; face in porphyry. Taking out ore from above and below this level. Extracted from this level during this week 371 tons of ore, 1450 level.—Stopping some ore on this level. Extracted from this stope during the week 137 cars of ore. Have men on repairs where needed in the mine. During the week have hoisted 544 cars of ore and shipped to the Brunswick mill 428 1780 2000 tons. Average assay of railroad car samples of ore shipped to Brunswick mill for five days of the week, \$18.69. Battery assay for the week, \$14.83. Concentrates from ore worked at Occidental mill shipped to Selby Smelting and Lead Co.'s Works. Shipped from Occidental mill to U. S. Mint, Carson, bullion of the assay value of \$487.18; shipped from Brunswick mill to U. S. Mint, Carson, bullion of the assay value of \$7959.04. Total shipments, \$8446.22.

CHOLLAR.—Are doing the usual amount of repairing on the 450 and 750 levels. Have done some repairing on the 1640 level south drift. The east crosscut on 1610 level, 150 feet south of north line, is out 75 feet; face in porphyry.

POTOSI.—Have repaired 50 feet of south drift on 250 level. Have connected the raise from the 1100 level with the 1000 level. The winze is down 226 feet below the 1500 level; the bottom shows about four feet of quartz on the footwall, which gives low assays. Potosi and Bullion west crosscut on south line, 1500 level, is out 142 feet; face in porphyry. Extracted and sent to mill 363 tons of ore from the 930, 1100, 1150 and 1200 levels. Milled during the week 370 tons; on hand at mill, 133 tons; average battery assay, \$23.20. Are repairing the Potosi and Bullion northwest drift, 1800 level, Ward shaft, and will resume work in the face when finished.

BULLION.—The east crosscut, 350 feet south of north line, 1300 level, is out 90 feet; last four feet in quartz that gives low assays. The joint Potosi and Bullion west crosscut on north line, 1500 level, is out 142 feet; face in porphyry.

ALPHA.—Have completed repairs to Alpha shaft and shut it down. Hereafter, all work will be done from the 1800 level of the Ward shaft. During the week have been retimbering the joint southwest drift from the Ward shaft, 1800 level.

OCCIDENTAL.—The west crosscut from the south drift, 400 level, is in 75 feet, face showing stringers of fair ore. North drift from bottom of winze from 450 level has been extended 10 feet in low-grade ore. West crosscut, 550 level, is in 37 feet. Have started a drift from this crosscut in ore assaying \$20 per ton. West crosscut No. 2, 750 level, is in 19 feet, and is just entering the ledge.

CON. NEW YORK.—The west drift from top of raise, 75 feet above 600 level, is out 38 feet; top in quartz, showing bunches of fair ore.

SILVER HILL.—The south drift from the Justice shaft, 490 level, is out 675 feet; face in hard gypsum.

GOULD & CURRY.—On the Sutro tunnel level the joint north drift with the Savage Co. has been advanced 25 feet; total length, 379 feet; face in porphyry.

BEST & BELCHER.—900 level.—East crosscut No. 1 has been advanced 12 feet; total length, 84 feet; face in soft porphyry and stringers of quartz. West crosscut No. 1 has been advanced 23 feet through porphyry; total length, 198 feet.

ANDES.—On the 400 level west crosscut from north drift on east side of the ledge, advanced 15 feet; face in soft porphyry. During the week have been repairing connections between 175 and 350 levels to keep the airways open.

Pine Nut District.

PROSPECT.—*Genoa Courier*, April 25: The result of the ten tons of Monarch ore worked at Empire is \$134.87 in gold and \$9.90 in silver. The Monarch people are jubilant, and say they will go right ahead and erect a mill and "hoisting works." Fred Martin and Fred Klotz came in from Pine Nut bringing flattering news from the Monarch. They reported that the Monarch people had just struck the ledge at a depth of 104 feet in the main shaft, and that they had only cut through two and a half feet, and for that distance it was an excellent ledge, rich in gold and silver. They got their information from District Recorder Gray.

Hawthorne District.

GOOD OAE.—*Walker Lake Bulletin*, April 23: James Waddell arrived here from Hawthorne last Saturday with a carload of gold rock from the War Eagle mine in Hawthorne District, and owned by himself and Charles Kimball. He had the ore worked at the Franklin arrastre here by Mr. Savage. Mr. Waddell took a bar of bullion to the Carson mint yesterday that will return at least \$2000. Mr. Waddell arrived home on Monday and at once proceeded to whack up with his partner, Charley Kimball. He paid him \$1000 in five dollar gold pieces. The ten tons of ore yielded a bar of bullion worth \$2350. The gold was worth \$16.47 per ounce. Waddell & Kimball will at once begin work on a shaft for the better development of the mine.

PAMLILO.—Two sacks of ore taken from the

Pamlico mine last week yielded about \$1000. The ore was run through a hand crusher and panned out in Hawthorne. About two tons of ore taken from the same place were shipped to the Dayton arrastras and have not yet been heard from.

Tuscarora District.

NAVAJO.—*Times-Review*, April 22: North drift 350 foot level, has been extended eight feet. The vein continues without material change since last report.

NORTH BELLE ISLE.—West crosscut, 400 foot level, extended seven feet through seams giving low assays. Work has been resumed in No. 1 north drift, same level. Upraise from North intermediate above the 500 has been extended 12 feet. No. 1 upraise, south 500 foot level, extended 13 feet, and a drift extended north 10 feet, showing some fair grade ore.

NEVADA QUEEN.—Second level—No. 1 south drift advanced 20 feet, and No. 3 east crosscut 33 feet; will have them connected before the 1st. Have worked day shift in each of Nos. 1, 2 and 3 raises, all of which show continuous ore, average width 4 feet, assaying from \$106 to \$760. Third level—East drift from No. 3 raise in 16 feet, has exposed 18 inches of goods ore; looks well in the face. Stopes above third level show but little variation. Hoisted during the week 15 tons first class, average assay \$306 per ton, and 100 cars of second class, average \$52 21 per ton.

ARIZONA.

RICH WASTE ORE.—*Gazette*, April 23: Harry Watton went through the Bonsanza mine while he was in Harqua Hala this trip, and he says it is without exception the biggest thing he ever saw. He says the ore is very soft and can almost be shoveled up. The mill is running this month on what is termed waste, and the plates are heavily coated with gold. This waste is richer than some of the big gold mines can produce.

NEW MILL.—*Journal-Miner*, April 23: Eight men are employed on the Johnson group of mines near Stanton. During his recent visit East, J. A. Conley purchased a new mill, which will be placed on the property as soon as possible. He estimates that it will take about four months to get ready to start it up, and in the meantime he has arranged with A. L. Kerr for the use of the latter's mill to work the ore. Mr. Kerr is expected here in a few days, when the mill will be started up.

RICH ORE.—*Tucson Citizen*, April 23: Hon. Thomas Hughes is in receipt of a quantity of rich ore from the Prince Rupert mine, located in the Wrightson mining district, near Crittenden. The specimens show horn and wire silver and must necessarily be very rich. This ore gives generally a smelting return of from 150 to 320 ounces per ton. Some selected pieces have gone as high as 3000 ounces. The Rupert is the property of Mr. Thomas Hughes himself and D. W. Lyon, now in the city of Mexico, but have the same leased at present to parties from Bisbee, who ship a carload of ore of from 10 to 15 tons per month. It has six shafts of from 50 to 110 feet deep, with several drifts, and the "ore chute" 15 feet wide and 110 feet long without a break in it. This mine has been worked for some time, and a large amount of money has already been expended upon it, but now the owners will realize all they have paid out and have a bonanza left. Such is the history of mining.

DAKOTA.

SOUTHERN HILLS.—*Deadwood Pioneer*, April 23: Never since the days of the Bengal Tiger and other now abandoned properties have mining matters in the Southern Hills presented so encouraging an outlook. Developments on the Keystone mine have shown that, allowing for all natural exaggerations usual in such cases, a strike of great value has been made. Its richness and extent is still to be determined, but everything points to the conclusion that it will be permanent. Many other mines have been recently opened, among them the Spokane, Caliboga, Hayward group and others that go to show the immense value of the mineral deposits there when sufficient capital has been expended to open them properly. Near Custer there are deposits of telluride of value, but which have lain idle for want of proper facilities to work them. A movement is now on foot to secure the Four Mile stamp mill and fit it up as an experimental plant. If a satisfactory method of treatment can be secured it should make Custer a mining center of the Hills, second only to Deadwood.

NEW MEXICO.

TUNNEL.—*Silver City Enterprise*, April 22: W. H. Newcomb will let a contract in a few days to run a tunnel 600 feet, and to sink two shafts on the Mina Grande mine near Pinos Altos. One shaft is to be 65 feet deep, the other 135 feet. Work will be commenced next week. Troutman and Snyder Bros. have 11 feet of solid mineral in their claim on Copper Flat. They went through the iron and struck a well defined vein of copper glance ore carrying eight ounces in silver and two ounces in gold. Mr. Michael Murphy, one of the successful if not the most successful leaser in Lake valley, has, if reports are true, a veritable bonanza. He has been leasing regularly since the autumn of 1885, and has almost invariably made it pay handsomely. There is a specimen of ore from the "Jim Crow" mine, at Piedmont, on exhibition in the office of the Timmer house. It weighs 143 pounds and is valued at \$148. The average value of the ore ranges from \$1000 to \$3000 per ton. John Dodd has struck three feet of argentine in his Welcome mine at Black Hawk. The ore is yet not very rich, but it is increasing in depth is reached.
